

On September 12, 2006 we determined the elevation of the Northwest corner of Lot 7A, Block 2, Seaview Heights Subdivision. The elevation was determined to be 163.4 feet. MOA benchmark GAAB 126 was used to determine existing elevation. We did an as-built survey for Lot 7B, Block 2, Seaview Heights Subdivision on July 30, 2003 and also reset said lot corner. On October 6, 2003 we did an asbuilt survey of the relocated driveway and were to restake the said lot corner. The original rebar was found to be disturbed and we adjusted it to the proper location. The rebar was bent and the adjustment was made horizontally by using a hammer to move it to the proper location. We believe the rebar was the same rebar found at the time we originally surveyed the property.
