32	ADFG	Page 42	Table 2-6. Summary of Habitat Gains for Stakeholders' Preferred Alternatives.	ADF&G Alternative B provides an additional 1.4 acres of Chinook rearing habitat and 1.7 additional acres of coho rearing habitat. This is an increase of 22% and 17% respectively and is substantial compared to the proposed preferred alternative.	Comment noted.
33	ADFG	Page 43	Table 2-7. Incremental Costs Per Acre of Habitat for Stakeholders' Preferred Alternatives.	The incremental cost analysis per acre for ADF&G Preferred Alternative B is the same as the preferred alternative selected. It appears that the incremental cost is the same with a significant additional amount of rearing habitat (22% for Chinook and 17% for coho).	There were some errors in the data in the NVE row and the ADFG rows. This table has been corrected (see Table 4-10, Supporting Information Document).

3.0 Draft Fish and Wildlife Program					
34	Eklutna, Inc.	Page 44	3.0 Draft Fish and Wildlife Program	It is extremely unusual for a preferred option to be advanced in a preliminary plan without fully evaluating each viable option. Typically, a suite of 3-4 options is identified, and each option is reviewed through a series of criteria, on a point-by-point basis, leaving the public with an opportunity to review the case for each option. Options forwarded by the federal agencies and the Native Village of Eklutna were not thoroughly evaluated under the same criteria the Portal option was given. For the Program to be legally defensible, a full evaluation of each option - now including dam removal - should be included in the Program.	As described in Section 4.5 of the Supporting Information Document, the Project Owners evaluated over 30 comprehensive alternatives. The proposed flow regimes, required infrastructure, and operations of each of the 30+ comprehensive alternatives were evaluated equally to determine annualized costs and their associated environmental benefits. Dam removal was not brought forward during the alternatives analysis process; however, the Project Owners have since conducted a high-level analysis of the technical risks and cost implications associated with dam removal, including effects that an unregulated river hydrograph may have on infrastructure on or adjacent to the Eklutna River downstream of the existing dam. The use of other comparable renewable energy sources to determine how to offset the lost generation from the Eklutna Power Plant was also analyzed. This analysis is documented in a Technical Memorandum that is available in Appendix F of the Supporting Information Document.
35	NVE	Page 44	3.0 Draft Fish and Wildlife Program	The AWWU Portal proposal provides no solution for the complete blockage of salmon reaching the extensive lake spawning habitat required by sockeye salmon (which was the key driver for the Agreement in the first place) and 15 miles of upper tributaries spawning habitat above the lake that is highly amenable to Chinook and coho salmon. Without a connection to Eklutna Lake, restoring those key spawning grounds and habitat is impossible. The Project Owners admit in the Draft Program that “no change in sockeye rearing habitat is anticipated.” The proposed nominal flow releases from the AWWU Portal, which represent less than 10% of the inflows to Eklutna Lake, will only minimally enhance Chinook and coho salmon and their habitat in the lower Eklutna River and bear no resemblance to historic flows.	The Project Owners recognize that fish passage is important to NVE, the federal and state agencies, and others who have commented on the Draft Program and that fish passage may become feasible in the future. Therefore, the Proposed Final Fish and Wildlife Program includes a limited fish passage reopener (Section 4.2). With this limited reopener, if a new, proven methodology or technology becomes available, then the Committee may reevaluate the potential for the construction and operation of fish passage facilities both into and out of Eklutna Lake on its own initiative or at the request of any of the resource agencies or NVE. Fish passage measures must meet certain criteria (see Section 4.2 of the Proposed Final Fish and Wildlife Program).
36	NVE	Page 44	3.0 Draft Fish and Wildlife Program	As such, we reject the AWWU Portal alternative because it: 1. Fails to remedy the harms to sockeye salmon and their spawning habitat that instigated the Agreement and Program process; 2. Leaves one mile of dry riverbed that prevents fish from reaching Eklutna Lake; 3. Blocks access to the majority of sockeye, Chinook, and coho salmon spawning and rearing habitat in the lake and its tributaries; 4. Delivers inadequate flows for fish below the Eklutna Lake dam; 5. Ignores the requests of the Eklutna Dena’ina for the recovery of a natural river after 94 years of harm; 6. Ignores the science-based recommendations of the two federal agencies (USFWS and NMFS) that are responsible for protecting salmon and other affected fish and wildlife resources; 7. Could jeopardize the Anchorage drinking water system; and, 8. Burdens ratepayers and taxpayers with $57 million in unnecessary cost increases.	The Proposed Final Fish and Wildlife Program will not jeopardize the Anchorage drinking water system. The design of the Eklutna River Release Facility will not restrict AWWU's ability to withdraw water, nor will operation of the river release valve cause harmful pressure fluctuations within the system. The project will utilize the excess capacity within AWWU's tunnel to deliver water to the river. Of the 12 preferred alternatives presented by the Project Owners and other stakesholders during the alternatives analysis process, the Proposed Final Fish and Wildlife Program is the least costly alternative, along with the similar ADNR alternative at the same annualized cost, thus the least burdensome to ratepayers and taxpayers.

No.	Entity	Page	Section, Table, or Figure	Comment	Response
37	NVE	Page 44	3.0 Draft Fish and Wildlife Program	The Eklutna River has been degraded by hydropower for 94 years. It is not worth rushing into an expensive and ineffective solution when we can properly fix the problem within the next decade. NVE's alternative calls for a phased solution instead of a commitment to an additional 35-year term of devastation. Rather than commit ratepayers and taxpayers to a $57 million expense for the AWWU Portal, we suggest saving that money and waiting a few more years to do the job right at little to no cost to ratepayers and taxpayers.	The Project Owners have engaged in a 5-year process of studies and evaluation of alternatives in consultation with the Parties to the 1991 Agreement, NVE, Eklutna Inc., and other stakeholders. The Project Owners are contractually and legally bound by the terms of the 1991 Agreement, including the schedule, which calls for submission of the Proposed Final Fish and Wildlife Agreement to the Governor in April 2024.
38	Eklutna, Inc.	Page 45	3.1 Impacts to Fish and Wildlife	We urge a more thorough examination of the economic impact on Eklutna, Inc. due to the devaluation of landholding and the consequential impact on fisheries. Eklutna, Inc. owns nearly all the land on each side of the Eklutna River (River). Further, the State of Alaska's Public Access Assertion and defense unit has deemed Eklutna, Inc. to own the Ekutna Riverbed. There should be consideration of the legal ramifications of Eklutna, Inc.'s ownership of the riverbed and how access along the River will be managed. There is a need for a more comprehensive assessment of riparian rights for landholdings with a consideration of the effective regulatory taking of the Eklutna, Inc. land, suppression of economic opportunities on these lands, and the destruction of public and subsistence resources.	The 1991 Agreement does not require the Project Owners to examine the economic impacts due to the devaluation of landholdings affected by the development and operation of the Project. No party requested that we conduct such studies at the early stages of the study process when the NVE and Eklutna, Inc., among other entities, were invited to work collaboratively to develop study plans.
39	USFWS Enclosure	Page 45	3.1 Impacts to Fish and Wildlife	One of the main ecological functions of a river in a watershed is to transport water, sediments, and nutrients to and from freshwater and marine environments. Eklutna Lake and other headwater features in the watershed are a critical source of these nutrients. Recognizing the importance of this component of the watershed, the Service recommends the Fish and Wildlife Program include methods to reconnect Eklutna Lake to the Eklutna River at the dam.	The Proposed Final Fish and Wildlife Program includes a limited fish passage reopener (Section 4.2). With this limited reopener, the Project Owners recognize that reconnecting Eklutna Lake and Eklutna River for fish passage may become feasible in the future and fish passage is important to NVE, the federal and state agencies, and others who have commented on the Draft Program. If a new, proven methodology or technology becomes available, then the Committee may reevaluate the potential for the construction and operation of fish passage facilities both into and out of Eklutna Lake on its own initiative or at the request of any of the resource agencies or NVE. Fish passage measures must meet certain criteria (see Section 4.2 of the Proposed Final Fish and Wildlife Program).
40	USFWS Enclosure	Page 45	3.1 Impacts to Fish and Wildlife	The Service shares the Native Village of Eklutna's (NVE) desire to return salmon to the Eklutna River, which NVE has stated in Resolution 2022-043. The original Eklutna hydropower project in 1929, 94 years ago, marks the beginning of watershed function decline. Since that time, impacts to the riverine and wetland ecology have continued to mount; notable among these is the 1955 and 1964 establishment of the present-day dam at the outlet of the historical glacial moraine lake, namesake of the Eklutna people, which all but cut off stream flows downstream of the hydropower dam.	The 1929 hydroelectric project is a separate project from the existing Eklutna Hydroelectric Project with separate impacts. The 1991 Agreement addresses impacts to fish and wildlife from the existing Eklutna Hydroelectric Project.

No.	Entity	Page	Section, Table, or Figure	Comment	Response
41	USFWS Enclosure	Page 45	3.1 Impacts to Fish and Wildlife	The historical impacts associated with the complete dewatering of an anadromous stream of ecological and cultural significance have not been adequately quantified through the 1991 Agreement process. According to the 1991 Agreement, Project Owners are required to fund and conduct studies to examine and, if possible, quantify impacts to fish and wildlife as a result of the Project. The Draft Program (p. 45) does qualitatively describe impacts associated with river impoundment, stating the existing hydroelectric project "diverted all outflows from Eklutna Lake, [and that] reduced flows to the Eklutna River led to loss of winter rearing habitat, poor sediment transport, excessive siltation of stream channels, gravel starved stream channels, reduced water quality, and insufficient water depth for Chinook salmon spawning." Adding, "in addition to impacting fish habitat, the Project also impacted wetlands downstream of Eklutna Dam, both riparian wetlands that existed in the upper river and estuarine wetlands below the railroad bridge." The Draft Program (p. 45) summarizes, "[i]mpacts to salmon and wetlands likely had an indirect impact on the wildlife that depend on the salmon and utilize those wetlands".	In compliance with the 1991 Agreement, the Project Owners funded and conducted a 2-year study program that was developed in consultation with and concurred with by the Parties to the 1991 Agreement and NVE and other stakeholders. The study program was thorough and adequate.
42	USFWS Enclosure	Page 45	3.1 Impacts to Fish and Wildlife	While the Draft acknowledges historical conditions and loss of ecosystem functions, it stops short of attempting to quantify the change between pre-development and existing conditions, stating that "the original impact of the Project on fish and wildlife resources is difficult to quantify since no fish or wildlife studies were conducted pre-construction (p. 45)." This statement discounts multiple lines of inquiry which could have been followed to estimate actual system wide impacts associated with dam river impoundment and hydropower operation. Using models developed for this project could provide another means of comparing relative habitat losses with potential habitat gains. While the models developed for estimating habitat gains under different alternatives are only calibrated to 375 cubic feet per second (cfs), it would be informative to see what they would predict for spawning and rearing habitat at the historic flow levels to estimate loss.	The question of how much habitat would be gained if modeling was extended beyond the 375 cfs flow can be largely answered without the need for doing so. In the case of spawning habitat, only one of the 30 1D transects displayed habitat gains beyond the 375 cfs flow with all others showing defined peaks within the 375 cfs modeled range. This would suggest that modeling beyond 375 cfs would actually show a decrease in spawning habitats over the segment of the Eklutna River above Thunderbird Creek. Similarly for spawning, although not to the same degree, the majority (26) of the 1D juvenile transects showed defined peaks, in some cases multiple peaks, within the 375 cfs modeled range, which would again suggest that an overall decrease in juvenile habitat may occur in the Ekutna River at flows greater than 375 cfs.
43	USFWS Enclosure	Page 45	3.1 Impacts to Fish and Wildlife	Section 3.1 of the Draft Program does not quantify impacts to fish and wildlife. Therefore, as the majority of the watershed has been affected by the ecological repercussions of removing water, we recommend the final Program include impacts to consider the watershed effects. Avenues to explore quantification of impacts include: 1) employing higher test flow releases to calibrate instream flow and habitat models to flow levels commensurate with historical, formative flows; 2) giving due credit and scientific credence to Indigenous Knowledge provided by Native Village of Eklutna knowledge bearers regarding the historical state of the fishery and watershed; 3) empirical inferences of pre-dam hydrology and habitat conditions based on cross section morphology; and 4) an analog comparison of similar river systems through either reference stream case studies or literature review.	The Proposed Final Fish and Wildlife Program presents a program to protect, mitigate damages to, and enhance fish and wildlife impacted by the development of the Eklutna Hydroelectric Project. 1) The study flow release was conducted in September 2021; no additional study flow releases will be done. 2) A detailed description of the historical environment, including the traditional ecological knowledge (TEK) provided by NVE, was provided in the Initial Information Package (available on the project website: eklutnahydro.com) and Section 4.11.9 of the Supporting Information Document.

No.	Entity	Page	Section, Table, or Figure	Comment	Response
44	USFWS Enclosure	Page 45	3.1 Impacts to Fish and Wildlife	The Eklutna River is approximately 12 river miles long from dam to discharge into Knik Arm with a historic average width of 100 feet. That amounts to 145.5 acres of direct impacts in addition to other watershed impacts (wetlands, off-channel habitat, lake habitat, upper tributaries, and coastal habitat) that should be considered, as well as impacts on fish and wildlife using surrounding riverine and upland habitat.	Thank you for your comment. Impacts to fish and wildlife habitat from the existing project have been taken into consideration throughout this process.
45	USFWS Enclosure	Page 45	3.1 Impacts to Fish and Wildlife	Using the watershed approach sets a boundary to quantify potential direct, indirect, and cumulative impacts on fish and wildlife based on habitat. The Eklutna watershed is 174 square miles (111,360 acres) of which Eklutna Lake is 119 square miles (76,160 acres), the Eklutna River drainage is 17 square miles (10,880 acres), and the remaining area is in the Thunderbird Falls sub-watershed (USACE 2004, p.9). Therefore, the Draft Program should consider the 10,880 acres of habitat impacted in the Eklutna River drainage and should also include acres of habitat impacted by fluctuations in Eklutna Lake, areas of upstream tributaries, downstream river, wetlands, and coastal habitats in the watershed. Functional loss should include temporal loss and modifications of habitat.	Study objectives, study area, and study methods used are described in each of the 12 resource study reports that made up the 2-year study program. The 2-year study program was developed in consultation with and concurred with by the Parties to the 1991 Agreement and NVE and other stakeholders.
46	USFWS Enclosure	Page 45	3.1 Impacts to Fish and Wildlife	All of these watershed impacts should be quantified in the in the Fish and Wildlife Program. Quantifying these impacts gives context to the PME measures proposed.	Impacts were quantified to the extent possible in the study reports.
47	NVE	Page 45	3.1 Impacts to Fish and Wildlife	Another significant deficiency in the consultation process has been the Project Owners' failure to evaluate the potential impacts of their proposed Draft Program and alternatives on the critically endangered Cook Inlet beluga whale – a national NMFS priority species – and its designated critical habitat which includes the mouth of the Eklutna River. Again, such evaluation would be required in any FERC relicensing under Endangered Species Act ("ESA") section 7. Given the Agreement's express intent to provide comparable protection to a FERC proceeding, the Owners failure to fully evaluate the Project's impacts on the Cook Inlet beluga whale is inexplicable and unjustifiable.	Beluga whale observations were reported in the Terrestrial Wildlife Study Report and increased flow releases and salmon abundance was noted as a benefit to marine mammals, including beluga whale, in the July 2023 Alternatives Analysis meeting dicussion on potential wildlife impacts of flow release scenarios.

No.	Entity	Page	Section, Table, or Figure	Comment	Response
48	NVE	Page 45	3.1 Impacts to Fish and Wildlife	The AWWU Portal puts the least amount of water in the river of all the alternatives for regular flows and high-flow events. The justification for choosing the lowest flow alternative primarily comes from economic considerations rather than what is best for fish and wildlife. The Agreement makes clear that the consideration of non-fish and wildlife factors should be made by the Governor, not by the Project Owners in the Draft Program. The preferred alternative continues to create a dead-end river, with over a mile of dry streambed below the dam. Creating a dead-end river hardly mitigates the damages caused to fish and wildlife from the Project because it prevents connectivity between Knik Arm, the lower Eklutna River, the lake, and the upper tributaries. The preferred alternative cannot mitigate damages to sockeye in any way because it will continue to prevent nearly all anadromous sockeye from spawning in the Eklutna River system. Because the destruction of the sockeye run was the "specific concern" leading to the Agreement, a Program that continues to prevent almost all sockeye from spawning is impermissible. The preferred alternative permits less than 10% of the river to flow down its historic channel to the Knik Arm, the smallest amount of any proposed alternative.	Thank you for your comment.
49	NVE	Page 45	3.1 Impacts to Fish and Wildlife	The Agreement's protection, mitigation, and enhancement purpose is not limited to salmon but instead includes all fish and wildlife impacted by the Project. Reducing the ecological function of the tidal wetlands, lower river, lake, and upper tributaries from the Project's impacts reduces the health of fish and wildlife throughout the watershed. However, the Draft Program is not built upon any surveys or studies of marine mammals and its consideration of terrestrial and avian wildlife and habitat is severely inadequate.	The scope of analysis covered in the study program was agreed to by all of the Parties to the 1991 Agreement, NVE and other stakeholders. The Owners conducted the agreed to study methods and relied on that information in the alternatives analysis and ultimately in the Proposed Final Program.
50	NVE	Page 45	3.1 Impacts to Fish and Wildlife	The wildlife habitat survey study area boundary was limited to the lower end of the lake, the current river channel corridor, and a section of the wetlands at the river mouth.80 This study area boundary is insufficient and should have included the entire Eklutna watershed, including the upper tributaries, the entire lake, and the off channel stream areas in the lower river valley, given the Project harms to the whole Eklutna watershed ecosystem. Because of the limited study area, the wildlife analysis could not fully consider the protection, mitigation, and enhancement from all the alternatives, including the potential restoration of habitat from increasing flows and reconnecting the lower river to the lake and upper tributaries.	Study objectives, study area, and study methods used are described in each of the 12 resource study reports that made up the 2-year study program. The 2-year study program was developed in consultation with and the Parties to the 1991 Agreement and NVE and other stakeholders.

No.	Entity	Page	Section, Table, or Figure	Comment	Response
51	NVE	Page 45	3.1 Impacts to Fish and Wildlife	Terrestrial and avian wildlife and habitat studies were primarily conducted via aerial surveys and literature reviews, both which have issues regarding their accuracy and the amount of place-specific detail they can provide. A recent scientific review of the accuracy of wildlife aerial surveys stated that aerial surveys can be an efficient platform to collect observational counting data "across large spatial areas," but which are far less well-suited for specific and small-scale geographies like the Eklutna survey area. Furthermore, the review noted common errors such as "nondetection, counting error, and species misidentification" that if not adequately addressed at all stages of the study "can provide data that obscure animal-environment relationships or introduce biases into inferences." The Project Owners provide no details or assurances that their limited surveys addressed these common errors. Furthermore, aerial and other surveys for wildlife were extremely limited. For example, only one day of raptor aerial surveys were completed, four days of migratory shorebird and waterfowl surveys were completed, and three days of moose surveys were completed, all during 2022. These surveys would not account for any annual variation in wildlife abundance or timing in the Eklutna watershed, as well as seasonal access limitations, among other issues. Wildlife habitat analysis relied on historic and current aerial photography with no ground vegetation surveys completed. Scientific literature on Alaska wildlife and habitat is rarely area specific and is therefore not necessarily a valid representation of species using the Eklutna watershed either for their full lifecycles or for their migration routes or travel corridors.	Study objectives, study area, and study methods used are described in each of the 12 resource study reports that made up the 2-year study program. The 2-year study program was developed in consultation with and the Parties to the 1991 Agreement and NVE and other stakeholders.

No.	Entity	Page	Section, Table, or Figure	Comment	Response
52	NVE	Page 45	3.1 Impacts to Fish and Wildlife	Overall, the Plan recognizes that increasing the Eklutna River's flow below the dam will "directly or indirectly benefit several ecologically and/or culturally important wildlife species" such as wolves, moose, raptors, and bears. Yet, because of the severe lack of adequate baseline data, it is impossible to truly analyze and understand how the different alternatives would impact and potentially benefit all wildlife and their habitat and to what degree. For example, even though listed in the "observed or expected" wildlife list, the Draft Program fails to consider imperiled species like the Little brown bat (*Myotis lucifugus*) that rely on the Eklutna watershed and for which mitigation and enhancement of their foraging habitat in the lower Eklutna River valley, which is currently harmed by the Project, could be improved by increasing flows and rebuilding off channel habitat in the lower river. The Draft Program also fails to analyze why certain wildlife populations appear to be below normal levels. For example, the Summary of Study Results notes that "[w]aterfowl and shorebird numbers in the study area were moderate and low, respectively, during the field surveys" and that "[s]horebirds were noticeably absent during the spring surveys." This may be an example of a system that is in depression from nearly a century of harms from hydroelectric dams. These examples, and many others, highlight the Draft Program's inadequacies in considering and rigorously analyzing how the different alternatives would impact all non-salmonid fish and wildlife in the Eklutna system and whether the preferred alternative provides adequate mitigation and enhancement.	Comment noted.

No.	Entity	Page	Section, Table, or Figure	Comment	Response
53	NVE	Page 45	3.1 Impacts to Fish and Wildlife	Regarding marine mammals, the Draft Program fails to consider the protection, mitigation, and enhancement of Cook Inlet beluga whales, one of the nation's most critically endangered marine mammals. The best available science shows that Cook Inlet belugas could significantly benefit from increased salmon runs in the Eklutna River. Given the mouth of the Eklutna River is within designated critical habitat in upper Cook Inlet where the majority of the Cook Inlet beluga population forages during the summer, the critically endangered whales should be a primary concern for the Program. The 2011 critical habitat designation for Cook Inlet belugas identified shallow intertidal and subtidal waters of Cook Inlet in close proximity to medium to high flow anadromous fish streams along with four species of Pacific salmon (Chinook, sockeye, chum, and coho) as essential to the beluga's conservation (also known as Primary Constituent Elements). NMFS 2016 Recovery Plan for Cook Inlet belugas identifies prey availability as a threat of medium concern for their recovery. NMFS acknowledges the heightened importance of prey availability, specifically Pacific salmon, for conserving Cook Inlet beluga whales. NMFS' Species in the Spotlight, 2021-2025 report states that, "[s]urvival and recovery of Cook Inlet beluga whales depend on an adequate quantity, quality, and accessibility of prey resources." In a recent notice to issue an IHA proposal from the Port of Alaska, NMFS noted that, "Pacific salmon represent the highest percent frequency of occurrence of prey species in CIBW stomachs." The notice highlighted that rich foraging areas to the north of the Port of Alaska, including the Eklutna River, are important to belugas and that the whales correlate their movements into Knik Arm around the timing of the salmon runs in those rivers. A recent 2023 study by Wild et al. delineated portions of Cook Inlet, including Knik Arm and the mouth of the Eklutna River, as a Biologically Important Area (BIA) for the small and resident population of Cook Inlet beluga whales based on scoring methods outlined by Harrison et al. in 2023.	The Project Owners agree that increased salmon runs anticipated to result from the increase in fish habitat under the Proposed Final Fish and Wildlife Program should benefit Cook Inlet beluga whales.

No.	Entity	Page	Section, Table, or Figure	Comment	Response
54	NVE	Page 45	3.1 Impacts to Fish and Wildlife	The best available science shows that restoring abundant salmon runs to the Eklutna River may be one of the key strategies available for Cook Inlet beluga recovery by creating more foraging opportunities for belugas in upper Cook Inlet. The results of a 2020 study by Norman et al. suggest that "reproductive success in [Cook Inlet belugas] is tied to salmon abundance" in the Deshka River, which is also located in upper Cook Inlet near Knik Arm and the Eklutna River. That study showed that "if salmon runs remained at their current levels, the [Cook Inlet beluga] population would likely continue its current slow decline," yet the study found that "if Chinook salmon increased 20% or more, the current decline would likely be reversed." Furthermore, the study simulations found that "doubling the salmon abundance would be sufficient to allow recovery of the population regardless of impacts from other threats." The study noted that while Chinook are the most nutritionally important salmon species for Cook Inlet belugas, belugas still rely on other salmon species as important prey. Moreover, a recent 2023 study by McHuron et al. found that if there is enough prey abundance for Cook Inlet belugas, the whales can withstand other intermittent stressors, concluding that increasing prey availability increases the beluga's resiliency to threats. Another recent 2023 study by Warlick et al. stated that "aerial survey data suggest that the [Cook Inlet beluga] population continues to decline[, and the] leading hypotheses include reduced prey availability […]."	Comment noted. See also response to Comment # 53.
55	NVE	Page 45	3.1 Impacts to Fish and Wildlife	The proposed nominal flow releases from the AWWU Portal will only minimally enhance Chinook and coho salmon and their habitat in the lower Eklutna River. The AWWU Portal provides no solution for the complete blockage of salmon reaching the extensive lake spawning habitat required by sockeye salmon and miles of upper tributaries spawning habitat above the lake that is highly amenable to Chinook and coho salmon, both of which are primary forage species for Cook Inlet belugas. Without connection to Eklutna Lake, protecting, mitigating, and enhancing those key spawning grounds and habitat is impossible. In turn, the mitigation and enhancement for Cook Inlet beluga whales are likely to be minimal as well. Furthermore, no analysis was completed for how the other alternatives considered would benefit Cook Inlet belugas.	The Proposed Final Fish and Wildlife Program includes a limited fish passage reopener (Section 4.2). With this limited reopener, the Project Owners recognize that fish passage may become feasible in the future and fish passage is important to NVE, the federal and state agencies, and others who have commented on the Draft Program. If a new, proven methodology or technology becomes available, then the Committee may reevaluate the potential for the construction and operation of fish passage facilities both into and out of Eklutna Lake on its own initiative or at the request of any of the resource agencies or NVE. Fish passage measures must meet certain criteria (see Section 4.2 of the Proposed Final Fish and Wildlife Program).
56	NVE	Page 45	3.1 Impacts to Fish and Wildlife	The Draft Program's severely inadequate analysis of non-salmonid fish and wildlife fails to meet the purposes of the Agreement and the standard of a similar federal process, and severely inhibits the Governor's ability to make an informed decision.	The scope of analysis covered in the study program was agreed to by all of the Parties to the 1991 Agreement, NVE and other stakeholders. The Owners conducted the agreed to study methods and relied on that information in the alternatives analysis and ultimately in the Proposed Final Program.
57	USFWS Enclosure	Page 46	Section 3.2 PME Measures for Fish and Wildlife	The proposed Program does not mitigate for all impacts of the Project. Performance of a wetland functional assessment was previously planned to quantify impacts, as agreed upon by the TWG. However, according to the Wetlands and Wildlife Study Results (p.38, ABR June 2023), because no permits were needed, functional loss was based on best judgement of the Project Owner's consultant instead, and no mitigation for loss of wetlands was proposed.	The Project Owners maintain that the Program significantly mitigates the Project's impacts to fish and wildlife. The 1991 Agreement does not require the Project Owners to mitigate all impacts of the Project. The Wetlands and Wildlife studies were conducted in accordance with the final study plans. USFWS concurred with the scope of work in the final study plans on April 29, 2022.

No.	Entity	Page	Section, Table, or Figure	Comment	Response
58	USFWS Enclosure	Page 46	Section 3.2 PME Measures for Fish and Wildlife	The Service recommends a broader scale of PME measures be developed to mitigate the full range of impacts from the Project. The Service provided our preferred alternative on July 3, 2023. In summary, our recommendation included the replacement dam and our preferred flow regimes: year-round instream flows of 160 cfs June through October and 75 cfs January to May, with an adaptive management strategy that allows for adjusting the flow regime based on new information and monitoring results; and channel maintenance flows of 800 cfs once, then 700 cfs every 3 years.	The Project Owners considered and evaluated all 12 preferred alternatives submitted as part of the Alternatives Analysis process. The evaluation included a cost effectiveness analysis, impacts to ratepayers and taxpayers, and resource impacts (see presentation from July 2023 alternatives analysis meeting). The Project Owners believe the PME measures in the Proposed Final Fish and Wildlife Program meet the requirements of the 1991 Agreement.
59	USFWS Enclosure	Page 46	Section 3.2 PME Measures for Fish and Wildlife	Additionally, as described in our recommendation letter, dated July 3, 2023, the Service recommends AWWU bridge construction, partial lakeside trail improvements, and physical habitat improvements. We are open to a phased implementation approach whereby more water is returned to the Eklutna River as soon as possible while time is provided in the Fish and Wildlife Program for planning a new dam. If a new dam is not possible, then the next best alternative would be the existing dam with new infrastructure for fish passage.	The Proposed Final Fish and Wildlife Program includes AWWU bridge construction, funding for lakeside trail improvements, and funding for physical habitat improvements (Sections 2.4, 2.5.1, and 3.3.6). The Proposed Final Fish and Wildlife Program also includes a limited fish passage reopener (Section 4.2).
60	USFWS Enclosure	Page 46	Section 3.2 PME Measures for Fish and Wildlife	The Fish and Wildlife Program should incorporate habitat improvements, including repair and maintenance of the perched culverts and other fish passage structures such as those along the AWWU access road. The Program should include enhancement and protection of spawning a rearing habitat in Eklutna Lake and tributaries, and Eklutna River habitat.	Repairs and maintenance of the AWWU access road is not the responsibility of the Project Owners.
61	Eklutna, Inc.	Page 47	Section 3.2.1.1 Eklutna River Release Facility	Further, the North Anchorage Land Agreement mandates that Eklutna, Inc. must consent to most forms of development on its land within the Chugach State Park. Our review of the Program did not indicate whether the lands utilized for the Portal option are Eklutna, Inc. lands. Please provide in the Program a description of all lands proposed for use on the Portal option.	The AWWU Portal Valve is located on BLM land. It's likely that the bridge crossings are on Eklutna Inc. land, but within AWWU's easement. Land ownership and management is discussed in Section 2.1.10 of the Supporting Information Document.
62	ADNR	Page 47	Section 3.2.1.1 Eklutna River Release Facility	The Project Owner's Draft Program would create an Eklutna River Release facility adjacent to the existing AWWU portal valve approximately one mile downstream from the dam. As the concept is described in the draft program, the infrastructure modification may not require a Certificate of Approval from the Alaska Dam Safety Program. It would utilize existing outlet works from the reservoir to the AWWU facility downstream. Additional development of the option would be required to make a definitive determination.	Comment noted.

No.	Entity	Page	Section, Table, or Figure	Comment	Response
63	NMFS	Page 47	Section 3.2.1.1 Eklutna River Release Facility	The proposed actions within the draft Program do not align with our management interests to re-water the full length of the Eklutna River as outlined in our September 11, 2023, recommendations. This leaves extensive project related impacts unaddressed. To meet the intent of the 1991 Agreement for mitigating project related impacts, to enhance fish, wildlife, and habitat affected by the Project, and to function at least as well as would have been the case under FERC licensing, the entire river should be re-watered on a year-round basis. Adding water to the full extent of the river is possible with a new spillway gate (discussed below) and would provide broader, holistic ecological benefits that will, in turn, benefit species like Pacific salmon and their prey species. Further, minimum flows in the entire reach of the river affected by Project operations are a common FERC license requirement. Adopting this recommendation to re-water the full length of the Eklutna River would promote the stated 1991 Agreement intent to function at least as well as Federal regulation. We understand the limitations of the existing Project design to meet this stated goal. However, in our view appropriate Project modifications and an adaptive management plan can better balance water availability for fish habitat and hydropower generation. A new spillway gate could be the first step.	The Project Owners recognize that a fixed wheel gate might be warranted in the future to better manage future spill events if climate change causes inflows to the resevoir to increase significantly and to provide for a higher magnitude channel maintenance flow (if needed). Therefore, in the Proposed Final Fish and Wildlife Program, the Project Owners have committed to conducting a more detailed feasiblity study of the fixed wheel gate within three years of the Governor's issuance of the Final Fish and Wildilfe Program. If found feasible and cost effective, on the 10th anniversay after initiating instream flows, the Project Owners will confer with the Committee to reevaluate the need for a fixed wheel gate based on information gathered from monitoring during that 10-year period.
64	NMFS	Page 49	Section 3.2.1.2 Flow Regime	The seasonal minimum flows outlined in the draft Program do not address the scale of direct Project related impacts and appear to be limited to the capability of the existing infrastructure. In order to account for and address the full scope of Project impacts, the mitigation measures need to re-establish a broader range of habitat availability within the Eklutna River. To do this, moderate increases in winter flow to 40 -70 cfs is a better option. We acknowledge the limitations of the existing infrastructure to provide winter flows and maintain hydropower operations; however, we see the potential for mitigation measures that balance these interests. Similarly, the draft Program's proposed summer flows of 40 cfs are described as flows that will increase habitat for coho and Chinook; however, our recommended summer flow of 160 cfs provides greater habitat availability to address project related impacts. The range of flows discussed in the first alternatives meeting included 80-90 cfs for maximum coho spawning habitat and 150-160 cfs for maximum Chinook habitat. Here, too, we see opportunity for better mitigation of Project related impacts while balancing hydropower generation. In addition, each of the resource agencies who are signatories to the 1991 Agreement recommended seasonal flows greater than seasonal flows identified in the draft Program. We recommend re-evaluating the seasonal flows in the context of our resource management interests and the data from the alternatives analysis process.	The Proposed Final Fish and Wildlife Program includes the same default year-round instream flow regime as in the Draft Fish and Wildlife Program. However, it should be noted the Monitoring and Adaptive Management Committee may modify the default year-round instream flow regime based on monitoring as long as as (1) the requested flows do not exceed the operational limitations of the Project infrastructure and (2) the ramping rates conform to fisheries ramping rate requirements (see Section 3.3.5 of the Proposed Final Fish and Wildlife Program). Additionally, because climate change may cause increased inflow to Eklutna Lake, 10 years after instream flows are established, the Project Owners will compare the average annual inflows to Eklutna Lake for the last 10 years to the previous 10-year period. Any increase in average annual inflows will be split 50/50 between hydropower and the annual water budget for instream flows. If there is a decrease in average annual inflows, the annual water budget for instream flows will not be decreased. The Project Owners will repeat this process every 10 years.

65	USFWS Enclosure	Page 49	Section 3.2.1.2 Flow Regime	While introducing some flow is an improvement over no flows, we disagree that introducing baseline levels for 11 out of the 12 miles of river with no connectivity to the lake restores habitat to productive levels or that the proposed flow regime would achieve a significant amount of the potentially available habitat, and the Service has provided previous comments on this subject.	Thank you for your comment.
66	USFWS Enclosure	Page 49	Section 3.2.1.2 Flow Regime	Habitat loss associated with dam development is not enumerated. Instead, existing conditions were set as the baseline for assessing potential PME measures for instream flow, geomorphology, sediment transport, and habitat models. These analyses were all based on test releases of up to 150 cfs, one tenth of historical bankfull flows (1,527-1,682 cfs in the pre-development historical channel; Hanson 2019, p. 6 and Appendix B). This flow level allowed for extrapolation of modeling up to 375 cfs (Kleinschmidt 2023b, pp. 18-19), which only evaluates habitat within the historical low flow channel. At this intermediate flow, the water never reaches the tops of the stream banks or accesses the floodplain. As we have stated previously (Service 2022, p. 3), this produces flawed estimates of rearing habitat gains and losses at different flow levels.	We previously responsed that the HEC-RAS model is useful as a "snapshot in time" model of the current condition of the channel to help inform analysis of potential new flow regimes. And as we have discussed throughout the study process that the channel will change in the future as it adjusts to any new flow regime. The term "floodplain" refers to the extent of innundation under peak flows in general, not the extent of test flows. The Monitoring and Adaptive Management Committee will execute a Monitoring and Adapative Management Plan, which may include a monitoring component to inform understanding of these future channel changes and an adaptive management component.
67	USFWS Enclosure	Page 49	Section 3.2.1.2 Flow Regime	The Service continues to recommend an instream flow regime that targets 160 cfs during the salmon spawning and migration window, and 75 cfs throughout the winter and shoulder seasons. These are the modeled flow levels which produce stream depths suitable for Salmon spawning and rearing, respectively (Moyle 2002, OSGC 1963, Thompson 1972, and DeVries 1997). Service recommended flow levels consider the literature as well as empirical Eklutna River reference stream channel measurements reported on in Hanson 2019.	Thank you for your recommendation.
68	USFWS Enclosure	Page 49	Section 3.2.1.2 Flow Regime	Reestablish Eklutna River hydrology through year-round instream flows that achieve longitudinal and lateral connectivity, fish passage through barriers, water quality standards, and suitable winter instream conditions to support functioning, resilient, and sustainable salmon habitat.	The new Eklutna River Release Facility will provide year-round instream flows to approximately 11 out of 12 miles of the Eklutna River. The default summer flow releases (40 cfs) when combined with natural accretion in the Eklutna River should (1) significantly increase the available spawning habitat for Chinook, coho, pink, and chum salmon, (2) provide sufficient flows for migrating adult salmon to navigate the potential upstream passage barriers identified in the confined canyon reach, and 3) provide additional rearing habitat for salmon.
69	USFWS Enclosure	Page 49	Section 3.2.1.2 Flow Regime	Implement measures to enhance spawning and rearing habitat based on functional deficits.	The new Eklutna River Release Facility will provide year-round instream flows to approximately 11 out of 12 miles of the Eklutna River. The default summer flow releases (40 cfs) when combined with natural accretion in the Eklutna River should (1) significantly increase the available spawning habitat for Chinook, coho, pink, and chum salmon, (2) provide sufficient flows for migrating adult salmon to navigate the potential upstream passage barriers identified in the confined canyon reach, and 3) provide additional rearing habitat for salmon.

70	ADFG	Page 52	Figure 3-3. Spawning Habitat Curves for the Eklutna River below the AWWU Portal Valve.	Add a figure showing the Rearing Habitat Curves below the AWWU Portal similar to Figure 3-3 (which presents the Spawning Habitat Curves). Benefits to rearing from increased flows should be discussed/detailed similar to benefits for spawning.	The Project Owners have coordinated with ADFG regarding benefits to rearing habitat which has been addressed in the Proposed Final Fish and Wildlife Program.
71	ADNR	Page 54	Section 3.2.2.1 Channel Maintenance Flows Infrastructure	This proposed alternative would require revisions to the operations and maintenance management of the Eklutna Lake Dam and appurtenant works which would require approval from the ADNR to maintain compliance with the state dam safety regulations. These proposed changes would require the installation of additional monitoring instruments and equipment automation. Depending on the scope and location of these modifications, an application for Certificate of Approval to Modify a Dam may be required.	Comment noted.
72	NMFS	Page 54	Section 3.2.2.1 Channel Maintenance Flows Infrastructure	The draft Program did not adopt our recommendation for a new spillway gate at the existing dam. The analysis provided indicates that continual flows from the dam would greatly diminish hydropower generation by requiring the pond to be held at a higher level. Thus, the draft Program proposed a new gaging system to improve estimates of flow releases. This proposed measure does not increase the range of flows or address future flow conditions. Further, this proposed measure does not fulfill the intent of the 1991 Agreement, which states that the Owners shall prepare a draft Program for “the protection, mitigation of damages to, and enhancement of fish and wildlife (including related spawning grounds and habitat).”	The Project Owners recognize that a fixed wheel gate might be warranted in the future to better manage future spill events if climate change causes inflows to the resevoir to increase significantly and to provide for a higher magnitude channel maintenance flow (if needed). Therefore, in the Proposed Final Fish and Wildlife Program, the Project Owners have committed to conducting a more detailed feasiblity study of the fixed wheel gate within three years of the Governor's issuance of the Final Fish and Wildilfe Program. If found feasible and cost effective, on the 10th anniversay after initiating instream flows, the Project Owners will confer with the Committee to reevaluate the need for a fixed wheel gate based on information gathered from monitoring durth that 10-year period.
73	NMFS	Page 54	Section 3.2.2.1 Channel Maintenance Flows Infrastructure	The Owners could have considered impacts on electric ratepayers and municipal water utilities in the Study Plans, and the Governor may consider efficient and economical power production during his review, but the draft Program’s mandate is solely to propose measures to protect and enhance fish and wildlife and to mitigate damages to such from the Project. By not including a new spillway gate in the draft Program, the potential for implementing a variety of flows to the Eklutna River is limited.	The Project Owners recognize that a fixed wheel gate might be warranted in the future to better manage future spill events if climate change causes inflows to the resevoir to increase significantly and to provide for a higher magnitude channel maintenance flow (if needed). Therefore, in the Proposed Final Fish and Wildlife Program, the Project Owners have committed to conducting a more detailed feasiblity study of the fixed wheel gate within three years of the Governor's issuance of the Final Fish and Wildilfe Program. If found feasible and cost effective, on the 10th anniversay after initiating instream flows, the Project Owners will confer with the Committee to reevaluate the need for a fixed wheel gate based on information gathered from monitoring durth that 10-year period.

No.	Entity	Page	Section, Table, or Figure	Comment	Response
74	NMFS	Page 54	Section 3.2.2.1 Channel Maintenance Flows Infrastructure	Further, not including a new spillway gate in the draft Program does not take into account the pervasive changes to inflows to Eklutna Lake, to fisheries, or habitat driven by climate change. The Fifth National Climate Assessment for Alaska includes two key messages that resonate with the 1991 Agreement process and development of mitigation measures. First, our built environment will become more costly. Much of Alaska's infrastructure was built for a stable climate, and changes in permafrost, ocean conditions, sea ice, air temperature, and precipitation patterns place that infrastructure at risk. The assessment indicates with high confidence that further warming is expected to lead to greater needs and costs for maintenance or replacement of infrastructure. Planning for further change and greater attention to climate trends and changes in extremes can help improve infrastructure resilience around Alaska. In addition, there is high confidence that Alaska's ecosystems are changing rapidly due to climate change. Many of the ecosystem goods and services that Alaskans rely on are expected to be diminished by further change. Careful management of Alaska's natural resources to avoid additional stresses on fish, wildlife, and habitats can help avoid compounding effects on our ecosystems. This climate assessment for Alaska, which includes modeled and observed climate related trends, demonstrates negative implications for the Eklutna Hydropower Project operations related to water control. Warming trends and increased precipitation will influence the impoundment level throughout the year, potentially leveling the flow duration curve, and will likely increase the potential for uncontrolled spill at the existing dam. Our recommendation for a new spillway gate will increase the resilience of the project to climate change effects, likely mitigating the potential for long-term maintenance and repairs, as well as improving the ability to implement cost effective mitigation measures or natural resources. Incorporating a new spillway gate at the existing dam, as discussed throughout the alternatives assessment process, would expand the range of flows released to the Eklutna River to	The Project Owners recognize that a fixed wheel gate might be warranted in the future to better manage future spill events if climate change causes inflows to the resevoir to increase significantly and to provide for a higher magnitude channel maintenance flow (if needed). Therefore, in the Proposed Final Fish and Wildlife Program, the Project Owners have committed to conducting a more detailed feasiblity study of the fixed wheel gate within three years of the Governor's issuance of the Final Fish and Wildilfe Program. If found feasible and cost effective, on the 10th anniversay after initiating instream flows, the Project Owners will confer with the Committee to reevaluate the need for a fixed wheel gate based on information gathered from monitoring durth that 10-year period.
75	USFWS	Page 54	Section 3.2.2.1 Channel Maintenance Flows Infrastructure	Include methods to facilitate larger channel maintenance flows from the lake, such as a new gate at the dam.	The Project Owners recognize that a fixed wheel gate might be warranted in the future to better manage future spill events if climate change causes inflows to the resevoir to increase significantly and to provide for a higher magnitude channel maintenance flow (if needed). Therefore, in the Proposed Final Fish and Wildlife Program, the Project Owners have committed to conducting a more detailed feasiblity study of the fixed wheel gate within three years of the Governor's issuance of the Final Fish and Wildilfe Program. If found feasible and cost effective, on the 10th anniversay after initiating instream flows, the Project Owners will confer with the Committee to reevaluate the need for a fixed wheel gate based on information gathered from monitoring durth that 10-year period.

No.	Entity	Page	Section, Table, or Figure	Comment	Response
76	NMFS	Page 54	Section 3.2.2.2 Channel Maintenance Flow Regime	The draft Program does not provide sufficient channel maintenance flows (also referred to as “flushing flows”) to address our resource management interests of reviving the riverine habitat after decades of no inflow and to ensure long-term in-stream habitat complexity. Similar to minimum flow for bypass reaches, flushing flows are consistent with Federal licensing requirements6. Although we agree with the timeframe for flushing flows, the proposed 220 cfs and associated water budget are inadequate to meet our resource management interests for migratory fish and their habitat. The proposed flows are unlikely to modify substrates and support habitat complexity in a meaningful way after nearly a century of limited impactful flow events. Our proposal for flushing flows of 700 cfs will result in significant, meaningful habitat modifications, consistent with natural hydrographs in unmodified rivers, and will mitigate impacts to the Eklutna River from hydropower development. These larger flushing flows need greater consideration for their functionality to mitigate project related impacts and meet the intent of the 1991 Agreement.	The default channel maintenance flow (Table 2-2 and Figure 2-2, Proposed Final Fish and Wildlife Program) was developed based on field studies, modeling, and peak flow statistics in similar unmanaged Alaskan rivers and is shaped to resemble a natural peak flow hydrograph. Per the water budget (Section 3.3.1, Proposed Final Fish and Wildife Program), 2,913 acre-feet of water is available for release into the Eklutna River at the beginning of each 10-year period for channel maintenance flows. Based on the results of the monitoring program, the Committee may request modifications to the magnitude, duration, frequency, or shape of the scheduled channel maintenance flow releases, as long as (1) the requested flows do not exceed the operational limitations of the Project infrastructure and (2) the ramping rates conform to fisheries ramping rate requirements. Furthermore, The Project Owners recognize that a fixed wheel gate might be warranted in the future to better manage future spill events if climate change causes inflows to the resevoir to increase significantly and to provide for a higher magnitude channel maintenance flow (if needed). Therefore, in the Proposed Final Fish and Wildlife Program, the Project Owners have committed to conducting a more detailed feasiblity study of the fixed wheel gate within three years of the Governor's issuance of the Final Fish and Wildilfe Program. If found feasible and cost effective, on the 10th anniversay after initiating instream flows, the Project Owners will confer with the Committee to reevaluate the need for a fixed wheel gate based on information gathered from monitoring during that 10-year period.
77	USFWS Enclosure	Page 54	Section 3.2.2.2 Channel Maintenance Flow Regime	The Draft Program (pp. 55-56) proposes channel maintenance flows with a duration of 72 hours in 3 out every 10 years. Flows would start at 40 cfs, be at a maximum of 220 cfs for 36 hours, and slowly decrease to mimic a more natural hydrograph. Channel maintenance flows are proposed to occur in fall (when lake levels are highest) as spill events from the existing maintenance gate at the dam in combination with flow releases at the Eklutna River Release Facility downstream. According to the Draft Program, if there is not enough water to spill over, then the proposal is to raise reservoir surface height to achieve the desired flow rate. According to the Terrestrial Wildlife Study Report (p. 66) there have only been nine high-flow events between the 1965 and 2019, when water overtopped the Eklutna Lake Dam spillway, during this period flows ranged from 85 cfs to 1,022 cfs (ABR 2023a). This proposal does not provide adequate flows to restore natural watershed hydrologic dynamics. The Service recommends an initial release of 800 cfs to reorganize the downstream channel and route as much aggraded sediment as possible, followed by triannual peak flows of 700 cfs. Routine peak flows target a water quantity that is seven times the mean annual flow, mimicking the rainfall peak in similar Alaskan rivers (Cathy Dube, personal communication).	The default channel maintenance flows (Table 2-2 and Figure 2-2, Proposed Final Fish and Wildlife Program) were developed based on field studies, modeling, and peak flow statistics in similar unmanaged Alaskan rivers and is shaped to resemble a natural peak flow hydrograph. The default channel maintenance flow (peaking at 220 cfs for 36 hours) should complement the base flow regime and help create and maintain channel dimensions and substrate characteristics to support physical fish habitat over the long term. The default downramping schedule Figiure 2-2, Proposed Final Fish and Wildlife Program) reflects a downramping rate of less than 1 to 2 inches per hour to reduce the risk of any fish stranding downstream when transitioning back to base flows.

No.	Entity	Page	Section, Table, or Figure	Comment	Response
78	USFWS Enclosure	Page 54	Section 3.2.2.2 Channel Maintenance Flow Regime	The Draft proposes a maintenance flow regime that fails to meet the standards of the Agreement studies themselves. A channel maintenance flow regime of a 220 cfs flow in 3 out of every 10 years is inadequate, and less than the lowest peak flow considered in the Geomorphology and Sediment Transport Study (lowest was 300 cfs; Watershed GeoDynamics 2023, pp. 109-110). The study highlights channel maintenance flows of 300 to 500 cfs for encouraging substrate particle sorting within the range of preferred spawning gravels for the target species coho salmon (O. kisutch) and Chinook salmon (O. tshawytscha; Watershed GeoDynamics 2023, p. 115).	The purpose of the geomorphology and sediment transport study was to develop a functioning model that could be used during the subsequent alternatives analysis. The study report showed a preliminary range of flows that may be adequate depending on the base flow regime. On May 17, 2023, during the second Alternatives Analysis meeting, the Project Owners presented new sediment transport modeling results including the proposed base flow regime and corresponding channel maintenance flow (220 cfs in three out of every 10 years). These results show that the 220 cfs channel maintenance flow is appropriate when paired with the proposed base flow regime.
79	USFWS Enclosure	Page 54	Section 3.2.2.2 Channel Maintenance Flow Regime	The notion that fractional maintenance flows are capable of maintaining instream habitats created under significantly higher flow conditions conflicts with our understanding of basic stream processes. A flaw in instream flow, habitat, and sediment transport analyses is that the studies assume the size and shape of the downstream channel will remain consistent with existing conditions. All flow levels less than historical conditions will be incapable of maintaining existing channel conditions in their reference (pre-impoundment) state. Every proposed flow level will therefore require modification of channel and floodplain to create self-sustaining habitat conditions within the river channel and adjacent side channel, wetland, and riparian habitats.	As discussed throughout the study process, the channel will change in the future as it adjusts to any new flow regime. The Monitoring and Adaptive Management Committee will execute a Monitoring and Adapative Management Plan, which may include a monitoring component to inform understanding of these future channel changes and an adaptive management component.
80	USFWS	Page 54	Section 3.2.2.2 Channel Maintenance Flow Regime	It is important to also note that the infrastructure modifications proposed in this Draft cannot accommodate the higher channel maintenance flows needed. All previously analyzed alternatives included a fixed-wheel gate which provided flexibility for controlled flow releases originating entirely at the lake.	The default channel maintenance flow (Table 2-2 and Figure 2-2, Proposed Final Fish and Wildlife Program) was developed based on field studies, modeling, and peak flow statistics in similar unmanaged Alaskan rivers and is shaped to resemble a natural peak flow hydrograph. The default channel maintenance flow (peaking at 220 cfs for 36 hours) should complement the base flow regime and help create and maintain channel dimensions and substrate characteristics to support physical fish habitat over the long term. The default downramping schedule Figiure 2-2, Proposed Final Fish and Wildlife Program) reflects a downramping rate of less than 1 to 2 inches per hour to reduce the risk of any fish stranding downstream when transitioning back to base flows.
81	USFWS Enclosure	Page 54	Section 3.2.2.2 Channel Maintenance Flow Regime	Reestablish channel maintenance flows that maintain bedform diversity and sediment continuity, maintain fish passage through all river reaches, and avoid fish stranding during down-ramping.	The default channel maintenance flow (Table 2-2 and Figure 2-2, Supporting Information Document) was developed based on field studies, modeling, and peak flow statistics in similar unmanaged Alaskan rivers and is shaped to resemble a natural peak flow hydrograph. The default channel maintenance flow (peaking at 220 cfs for 36 hours) should complement the base flow regime and help create and maintain channel dimensions and substrate characteristics to support physical fish habitat over the long term. The default downramping schedule (steps 4-11 in Table 2-2, Supporting Information Document) reflects a downramping rate of less than 1 to 2 inches per hour to reduce the risk of any fish stranding downstream when transitioning back to base flows.

No.	Entity	Page	Section, Table, or Figure	Comment	Response
82	NVE	Page 54	Section 3.2.2.2 Channel Maintenance Flow Regime	High flows are essential to mimic beneficial flooding. Seven of the nine alternatives proposed much more water during high flows, yet the Draft Program Plan settles on the lowest water discharge for channel maintenance flows of all discharges proposed. The maintenance flow regime in the preferred alternative is severely inadequate because it fails to return the river to its natural flow. The 220 cfs maximum flushing flows in the Draft Program is less than 20% of the average flushing flows of 1,402 cfs that USFWS estimated would be necessary to recreate the flows that historically supported the natural fishery and created the natural river channel and offchannel habitat. Worse, the Draft Program imagines the peak flow for just a few hours for just three out of every ten years before returning to conditions that approximate a severe drought. NMFS concluded that the proposed flushing flows in the Draft Program "are unlikely to modify substrates and support habitat complexity in a meaningful way after nearly a century of limited impactful flow events." The chosen channel maintenance flow hardly mitigates for the Eklutna River's deprivation of almost a century of flooding with a maximum recorded value of approximately 3,000 cfs.	The default channel maintenance flow (Table 2-2 and Figure 2-2, Supporting Information Document) was developed based on field studies, modeling, and peak flow statistics in similar unmanaged Alaskan rivers and is shaped to resemble a natural peak flow hydrograph. The default channel maintenance flow (peaking at 220 cfs for 36 hours) should complement the base flow regime and help create and maintain channel dimensions and substrate characteristics to support physical fish habitat over the long term. The default downramping schedule (steps 4-11 in Table 2-2, Supporting Information Document) reflects a downramping rate of less than 1 to 2 inches per hour to reduce the risk of any fish stranding downstream when transitioning back to base flows. Furthermore, the Project Owners recognize that a fixed wheel gate might be warranted in the future to better manage future spill events if climate change causes inflows to the resevoir to increase significantly and to provide for a higher magnitude channel maintenance flow (if needed). Therefore, in the Proposed Final Fish and Wildlife Program, the Project Owners have committed to conducting a more detailed feasiblity study of the fixed wheel gate within three years of the Governor's issuance of the Final Fish and Wildilfe Program. If found feasible and cost effective, on the 10th anniversay after initiating instream flows, the Project Owners will confer with the Committee to reevaluate the need for a fixed wheel gate based on information gathered from monitoring durth that 10-year period.
83	USFWS Enclosure	Page 57	Section 3.3.1 Public Water Supply	Implement stream crossing structures that promote stream functionality and flood resiliency.	Providing year-round instream flows to the Eklutna River will likely make all of the existing ford crossings along the AWWU access road impassable for most of the year. To mitigate these potential impacts, the Project Owners will construct eight new bridges, one at each of the existing ford crossings to allow AWWU year-round access to the AWWU pipeline for maintenance. The new bridges will be designed to pass the same flows as the two existing AWWU bridges. The existing ford crossings will be removed to prevent anyone from attempting to drive through the riverbed in the future.
84	ADFG	Page 57	3.3.2 Recreational Use and Facilities	There are some inaccuracies and incomplete reporting in the last paragraph. In 2021 there were two coho and one Chinook collected. One of the coho collected was determined to be wild and the other one of hatchery origin. The Chinook carcass collected in 2021 was determined to be a wild fish. In 2022 there were two Chinook collected and they were determined to be of hatchery origin. There were also two coho carcasses collected in 2022 but they have not been analyzed.	Thank you for your comment.

No.	Entity	Page	Section, Table, or Figure	Comment	Response
85	Eklutna, Inc.	Page 57	3.3.2 Recreational Use and Facilities	Protection of Native hunting, fishing, and gathering rights is a part of federal law throughout the United States. There was no discussion of subsistence rights and resources in the study. This analysis would be included in a Federal Energy Regulatory Commission relicensing process. We believe the public would expect a detailed description of subsistence resouces along the Eklutna River. Rather than discuss Eklutna River public and subsistence resources, the Program inexplicably assesses the impacts of an artificial fishery - Eklutna Tailrace. Please explain the obligation to mitigate an artificial fishery created to substitue for the destruction of a prominent salmon run less than 10 miles away. We do not understand why that impact is worth considering while the evaluation of subsistence fishing is essentially ignored.	The substantial measures that will be advanced in the Proposed Final Fish and Wildlife Program will significantly improve the prospects of subsistence resources in the Eklutna River. Based on studies and analysis, we anticipate the instream flows and habitat improvement measures that we commit to will significantly increase fish spawning and rearing habitat over existing conditions that will in turn create potential opportunities for subsistence fishing. It is a fishery used and enjoyed by a significant number of Alaskans and the Project Owners are obligated to take into account the value that fishery provides as we develop our Proposed Final Fish and Wildlife Program. Indeed, the presence of the tailrace fishery can assist greatly in mitigating fishing pressure in the Eklutna River on any fish populations that are expanding due to the Project Owner's proposed flow and habitat measures.
86	ADFG	Page 58	3.4.2 Water Budgets	Since there is an allocated amount of water for a given year (24,280 acre-feet, Section 3.4.2.1) there is no flexibility built into this plan to increase instream flows above this allocation unless that increase is compensated for the following year. If monitoring indicates that the proposed flow regime is not providing the additional spawning and rearing habitat that has been modeled, then this will make any adaptive management strategy ineffective. The plan as proposed would not have the flexibility to provide more than an incremental increase in proposed flows since the combined maximum discharge of water from the portal valve (80 cfs) and the current dam outlet gate (190 cfs) would not provide the additional water needed to implement other higher flow alternatives such as ADF&G Alternative B... Placing a hard cap on the annual water budget does not allow for effective adaptive management strategies to be implemented, if needed, to ensure the success of the Fish and Wildlife Plan. An initial annual water budget of 24,280 acre-feet may be adequate to assess the effectiveness of the Fish and Wildlife Plan but providing flexibility over the 35-year term of this plan is essential to ensure the success of the program. The addition of the fixed wheel gate to the Fish and Wildlife Plan would provide that flexibility.	In the Proposed Final Fish and Wildlife Program, some modifications have been made to the water budget to increase flexibility: 1.) the year-round instream flow water budget and the channel maintenance flow water budget have been combined, 2.) water can be banked for 5 years instead of 1 year as proposed in the Draft Fish and Wildlife Program, and 3.) 50% of the total annual water budget can be banked at any given time instead of 20% as proposed in the Draft Fish and Wildlife Program. Furthermore, the Project Owners recognize that a fixed wheel gate might be warranted in the future to better manage future spill events if climate change causes inflows to the resevoir to increase significantly and to provide for a higher magnitude channel maintenance flow (if needed). Therefore, in the Proposed Final Fish and Wildlife Program, the Project Owners have committed to conducting a more detailed feasiblity study of the fixed wheel gate within three years of the Governor's issuance of the Final Fish and Wildilfe Program. If found feasible and cost effective, on the 10th anniversay after initiating instream flows, the Project Owners will confer with the Committee to reevaluate the need for a fixed wheel gate based on information gathered from monitoring durth that 10-year period.
87	USFWS Enclosure	Page 58	3.4.2 Water Budgets	The Draft Plan includes conditions limiting the amount of banked water that can be used the following year, limiting how long water can be banked, and setting a May 1 deadline for flow modification requests. While the Service understands the Project owners need to minimize uncertainty to be able to effectively manage operations, we believe the conditions placed on water management restrict the effectiveness of the Adaptive Management Program. Banked water should not expire, and while the Adaptive Management Committee could submit a proposed water budget by May 1, the Adaptive Management Program should have a mechanism to make modifications within the water year if the Committee identifies a need and implementing the change is feasible. The Adaptive Management Committee should include a Project Owner representative.	In the Proposed Final Fish and Wildlife Program, water can be banked for 5 years (instead of 1 year in Draft Fish and Wildlife Program). The Committee must provide a 60-day notice to the Project Owners for any requests to modify the default year-round instream flow regime or the default channel maintenance flow schedule. If the requested flows exceed the operational limitations of the Project infrastructure, the available water budget, or the approved ramping rates, then the Project Owners may reject the requested flow modifications. If the Project Owners reject the requested flow modifications, then they must notify the Committee so that the Committee may request alternative flows if desired. The Committee may request modifications to flows within 60 days; however, the Project Owners are not required to meet the request if it is not operationally feasible. One or more representatives from the Project Owners will serve as non-voting participants on the Committee to provide technical expertise about Project operations.

No.	Entity	Page	Section, Table, or Figure	Comment	Response
88	USFWS Enclosure	Page 58	3.4.2 Water Budgets	There should also be a mechanism to address the water budget should any significant differences be found between modeled and actual habitat gains at different flow release levels.	The annual water budget remains at 24,280 acre-feet for year-round flow release into the Eklutna River and an additional 2,913 acre-feet is available at the beginning of each 10-year period starting the first water year after instream flows are initiated for channel maintenance flow. Based on monitoring results, the Committee may request modifications to the default year-round instream flow regime and/or the magnitude, duration, frequency, or shape of the scheduled channel maintenance flow releases, as long as (1) the requested flows do not exceed the operational limitations of the Project infrastructure, and (2) the ramping rates conform to fisheries ramping rate requirements. If the total volume of water to be released exceeds the available water budget (which includes any banked water that may be available), then that deficit will be carried over into the next water year.
89	ADFG	Page 60	3.4.3.2 Other Monitoring Efforts	Please provide a detailed breakdown of the estimated $270,000 budget for monitoring efforts.	In the Proposed Final Fish and Wildlife Program, the Project Owners have opted to provide a total of $450,000 in April 2024 dollars to ADFG over the length of the Program to fund monitoring efforts in the Eklutna River (Section 3.2, Proposed Final Fish and Wildlife Program). The Committee will develop the monitoring plan and ADFG will implement the monitoring plan and request funds from the Project Owners by July 1 of each year based on the planned monitoring effort for the subsequent year.
90	ADFG	Page 60	3.4.3.2 Other Monitoring Efforts	The draft plan states that the Committee may revise the monitoring plan or seek supplemental funding to conduct additional monitoring efforts if desired. Clarification is needed on where the source of this supplemental funding would come from.	The Project Owners will not provide additional funding but the Committee may pursue other funding sources for monitoring if desired.
91	ADFG	Page 60	3.4.3.2 Other Monitoring Efforts	Because channel maintenance flows are scheduled for fall, they have the potential to scour salmon redds and dislodge incubating eggs. Monitoring efforts should include scour depths in spawning areas to assess impacts of the maintenance flows timing on spawning habitat for adaptive management purposes.	The Committee will develop the monitoring plan, which could include scour monitoring. However, the Project Owners cannot change the general timing of when the channel maintenance flows occur (they have to occur in the fall) but they could change frequency, magnitude, and duration of channel maintenance flows (see Section 3.3.5 of the Proposed Final Fish and Wildlife Program regarding requests to modify flow regime).
92	ADFG	Pages 61-62	3.4.3.2 Other Monitoring Efforts	All monitoring efforts other than discharge are proposed to take place over 5 years except for winter temperature monitoring (3 years). Although the draft plan states that this additional monitoring need not take place in consecutive years, this effort would be inadequate to assess changes or determine long-term trends in fish use and improvements in habitat. Since the success of this program will be evaluated over 35 years a more robust monitoring program should be proposed.	In the Proposed Final Fish and Wildlife Program, the Project Owners have opted to provide a total of $450,000 in April 2024 dollars to ADFG over the length of the Program to fund monitoring efforts in the Eklutna River (Section 3.2, Proposed Final Fish and Wildlife Program). The Committee will develop the monitoring plan and ADFG will implement the monitoring plan and request funds from the Project Owners by July 1 of each year based on the planned monitoring effort for the subsequent year.
93	ADFG	Page 62	3.4.3.2 Other Monitoring Efforts	Hatchery Fish Straying section - Modify first sentence ‘All Chinook and coho carcasses (heads) observed in the Eklutna River during adult salmon surveys should be collected and delivered to ADFG for stock origin analysis to evaluate if straying is occurring and if so, at what proportion to wild escapement.’	In the Proposed Final Fish and Wildlife Program, the Committee will develop the monitoring plan to monitor aquatic habitat conditions and fish utilization in the Eklutna River and the straying rate of hatchery fish from the Eklutna Tailrace to the Eklutna River.

No.	Entity	Page	Section, Table, or Figure	Comment	Response
94	ADFG	Page 62	3.4.3.2 Other Monitoring Efforts	Angler days or catch per unit effort data from the tailrace fishery will not provide information to detect straying from the tailrace into the Eklutna River. Determining potential straying should be based on the results of spawner surveys on the Eklutna River and the results of the stock origin analysis. Project owners should focus the annual coordination with ADFG to determine if straying is occurring on these criteria and not tailrace data.	In the Proposed Final Fish and Wildlife Program, the Committee will develop the monitoring plan including the straying rate of hatchery fish from the Eklutna Tailrace to the Eklutna River. The Committee will provide a report on monitoring efforts to the Project Owners by March 1 of each year.
95	ADFG	Page 62	3.4.3.2 Other Monitoring Efforts	The Draft Fish and Wildlife Plan contains little reference to how the success of the Fish and Wildlife Plan will be evaluated other than goals for the winter temperature monitoring and substrate size. Criteria should be developed to determine if the plan is successful or not, including an increase in spawning and rearing habitat, effectiveness of channel forming flows and general fish abundance.	The Committee will develop appropriate evaluation criteria for the Fish and Wildlife Program (Section 3.1, Proposed Final Fish and Wildlife Program).
96	ADFG	Page 63	3.4.4 Adaptive Management	Paragraph 1 - In addition to determining what monitoring efforts should be conducted annually, a cost estimate should be developed on an annual basis for this effort.	In the Proposed Final Fish and Wildlife Program, the Project Owners have opted to provide a total of $450,000 in April 2024 dollars to ADFG over the length of the Program to fund monitoring efforts in the Eklutna River (Section 3.2, Proposed Final Fish and Wildlife Program). The Committee will develop the monitoring plan and ADFG will implement the monitoring plan and request funds from the Project Owners by July 1 of each year based on the planned monitoring effort for the subsequent year.
97	ADFG	Page 63	3.4.4 Adaptive Management	Paragraph 3 states that the Committee may request modifications to the peak flow releases as long as the total volume of water released in a 10-year period does not exceed 2,913 acre-feet. We assume that this is based on the total amount of water proposed in Table 3.3, Page 55. Please clarify.	Correct, the total volume of water available for channel mainteneance flow releases over a 10-year period is 2,913 acre-feet, which is based on the default channel maintance flows (Table 2-2, Proposed Final Fish and Wildlife Program).
98	ADFG	Page 63	3.4.4 Adaptive Management	The last paragraph states that the Project Owners are not responsible for responding to natural processes that result in undesirable conditions in the river such as debris flows associated with precipitation, beaver activity, large wood build-up, etc. We are therefore assuming that then if any undesirable condition in the river is a result of the provisions of the plan being carried out will be the responsibility of the Project Owners to rectify. For example, if a log jam that blocks fish passage is the result of the release of a channel maintenance flow that the Project Owners would remediate the blockage to fish passage since it would not be the result of a natural event. Maintaining the free passage of fish in the Eklutna River is essential to the success of the Fish and Wildlife Plan and should be incorporated into the plan.	The Committee is being funded to evaluate habitat conditions in the future which should identify any changed conditions in the river that might be undesirable. Also, the Committee is being funded to address opportunties for habitat improvement, which could include addressing things like log jams, which clearly would be a "natural event". The Project Owners do not acknowledge any responsibility for addressing such future potential conditions.

No.	Entity	Page	Section, Table, or Figure	Comment	Response
99	USFWS	Page 63	3.4.4 Adaptive Management	Provide more flexibility in the Adaptive Management Plan so that PMEs can be implemented as effectively as possible.	The following modifications have been made to Adaptive Management (Section 3.3, Proposed Final Fish and Wildlife Program) to provide more flexibility: 1.) the year-round instream flow water budget and the channel maintenance flow water budget have been combined, 2.) water can be banked for 5 years instead of 1 year, 3.) 50% of the total annual water budget can be banked at any given time instead of 20%, 4.) starting 10 years after instream flows are established, the Project Owners will compare the average annual inflows to Eklutna Lake for the last 10 years to the previous 10-year period, any increase in average annual inflows due to climate change will be split 50/50 between hydropower and the annual water budget for instream flows, and 5.) the Project Owners will provide a total of $350,000 in April 2024 dollars to ADFG to fund physical habitat enhancement and vegetation management efforts.
100	USFWS Enclosure	Page 63	3.4.4 Adaptive Management	Provide ongoing protection through continued collaboration so that adaptive management and monitoring remains effective and takes advantage of available resources. The goal of an adaptive management program is to maximize the effectiveness of these PME measures. The plan should be structured such that PME measures have elements; each element has objectives and monitoring to measure success; and PME measures have strategies listed for adaptive management, as described in the Service's letter, September 29, 2023.	A Monitoring and Adaptive Management Committee will be established to execute the Monitoring and Adaptive Management Plan (Section 3.0, Proposed Final Fish and Wildlife Program). The Committee will consist of one voting representative from each of the Signatories to the Implementation Agreement, but it is anticipated that the Committee will make decisions through consensus. The Committee chair will be selected by the members of the Committee. Once the Committee is established, it will develop appropriate evaluation criteria for the Fish and Wildlife Program. These evaluation criteria will help inform monitoring efforts and adaptive management decisions.
4.0 Measures Not Selected for Fish and Wildlife Program					
101	ADFG	Page 65	Section 4.1 Higher Flow Releases from the AWWU Portal Release Facility	This section fails to take into account all aspects of habitat gains by only utilizing spawning habitat for Chinook and coho salmon. The draft plan also needs to include gains in rearing habitat for these species. The section and corresponding figures should be updated to reflect this.	There are increases to rearing habitat under the Proposed Final Fish and Wildlife Program base flow regime; 6.3 acres for Chinook and 9.9 acres for coho (Table 4-9, Supporting Information Document). Also, the Committee is being funded to allow physical habitat manipulation which could include measures to increase rearing habitat.
102	USFWS	Page 65	Section 4.1 Higher Flow Releases from the AWWU Portal Release Facility	Include a higher instream flow regime to increase downstream salmon rearing habitat; the channel maintenance flow regime should be increased commensurate with the increased instream flow regime.	There are increases to rearing habitat under the Proposed Final Fish and Wildlife Program base flow regime; 6.3 acres for Chinook and 9.9 acres for coho (Table 4-9, Supporting Information Document). Also, the Committee is being funded to allow physical habitat manipulation which could include measures to increase rearing habitat.
103	USFWS	Page 67 and Page 73	Section 4.4 Flow Releases from the Existing Dam (RM 12) and Section 4.6 Replacement Dam	Provide water to the full length of the river on a year-round basis.	Flow releases from the existing dam and the replacement dam are the two options considered during the alternatives analysis that would would provide water to the full length of the river. Flow releases from the existing dam would eliminate over 80% of the reservoir storage from being utilized for power generation and loss of power generation when demand is highest, therefore flow releases from the dam was not included in the Proposed Final Fish and Wildlife Program (Section 4.11.4, Supporting Information Document). The cost of the replacement dam and 40% loss of reservoir capacity are the primary reasons dam replacement was not in the Proposed Final Fish and Wildlife Program (Section 4.12.1, Support Information Document).

No.	Entity	Page	Section, Table, or Figure	Comment	Response
104	Eklutna, Inc.	Page 68	Section 4.5 Fish Passage	The historical presence of Eklutna around the Eklutna Lake and land selection issues must be acknowledged and integrated into the decision-making process. In most documents evaluating project alternatives, the original condition of the environment is considered. We suggest including a detailed accounting of the Eklutna River before the 1928 hydroelectric power project, rooted in tribal ecological knowledge from the records of the Native Village of Eklutna and other available sources. The public deserves to understand better what may be gained through connecting the Eklutna Lake to the Inlet. Currently, the Program advances selective studies dispelling the existence and viability of sockeye in the Ekutna Lake. A fair and balance document would include the narrative on pre-1928 River condition.	While we have acknowledged and studied historical aspects of Eklutna Lake and the Eklutna River, we disagree that we must examine the pre-1928 Eklutna River conditions as any type of baseline as opposed to looking at existing conditions in the Eklutna River. No such requirement exists in the 1991 Agreement or under Federal Energy Regulatory Commission relicensing proceedings, on which the 1991 Agreement is modeled. As stated above, the 1991 Agreement does not place upon us (and our members and taxpayers) the legal or contractual requirement or responsibility to study or address all adverse effects of all hydroelectric development in the Eklutna River basin over the past 100 years.
105	USFWS	Page 68	Section 4.5 Fish Passage	The Draft Program does not address fish passage; it proposes to release a baseline level of year-round instream flows from the Anchorage Water and Wastewater Utility portal valve located approximately 1 mile downstream from the Eklutna Lake dam, and it does not propose infrastructure changes to accommodate the higher flows required for channel and habitat maintenance. As drafted, we believe the Program does not entirely meet the intent of the 1991 Agreement, which was established in part due to concerns for the sockeye salmon run.	The Proposed Final Fish and Wildlife Program includes a limited fish passage reopener (Section 4.2). With this limited reopener, the Project Owners recognize that fish passage may become feasible in the future and fish passage is important to NVE, the federal and state agencies, and others who have commented on the Draft Program. If a new, proven methodology or technology becomes available, then the Committee may reevaluate the potential for the construction and operation of fish passage facilities both into and out of Eklutna Lake on its own initiative or at the request of any of the resource agencies or NVE. Fish passage measures must meet certain criteria (see Section 4.2 of the Proposed Final Fish and Wildlife Program).
106	USFWS	Page 68	Section 4.5 Fish Passage	The Program should provide connectivity to the lake, release year-round instream flows sufficient to support salmon spawning and rearing habitats throughout the river corridor, and accommodate periodic high-volume flows that maintain habitat characteristics through a self-sustaining dynamic equilibrium between the hydrograph and natural sediment supply. The Service acknowledges the appreciable costs associated with a Program that adequately addresses sockeye salmon and other stakeholder concerns. However, we do not believe that cost alone is a compelling enough argument to dismiss the Eklutna Lake sockeye salmon fishery, which was the primary driver for the 1991 Agreement. Recognizing this divide, the Service recommends a phased approach which sets interim terms or benchmarks to spur incremental progress towards a long-term and mutually agreeable solution that ultimately provides fish passage at the dam and instream flows capable of supporting fish and wildlife into the future.	Cost alone was not the sole reason fish passage was not selected for the Fish and Wildlife Program: upstream volitional fish passage would have significant effects on the hydropower project, particularly during the winter when it is needed most, and there are significant concerns regarding the effectiveness of downstream fish passage (i.e., low attraction flow velocities and/or the inability to operate the downstream fish passage facilities while the lake is frozen over). Section 4.11.9 of the Supporting Information Document presents lake study results and justification for the exclusion of upstream and downstream fish passage measures. The Project Owners recognize that fish passage may become feasible in the future and fish passage is important to NVE, the federal and state agencies, and others who have commented on the Draft Program. Therefore, the Proposed Final Fish and Wildlife Program includes a limited fish passage reopener (Section 4.2). With this limited reopener, if a new, proven methodology or technology becomes available, then the Committee may reevaluate the potential for the construction and operation of fish passage facilities both into and out of Eklutna Lake on its own initiative or at the request of any of the resource agencies or NVE. Fish passage measures must meet certain criteria (see Section 4.2 of the Proposed Final Fish and Wildlife Program).

No.	Entity	Page	Section, Table, or Figure	Comment	Response
107	USFWS	Page 68	Section 4.5 Fish Passage	Provide a long-term solution to get marine derived nutrients from the river to the lake. We have expressed openness to a phased approach in returning sockeye salmon to the lake. The Final Program should provide a commitment to design a phased approach within five-years of the Final Program.	It has been theorized, but not studied, that if fish passage was provided into Eklutna Lake, the spawning salmon would bring enough marine derived nutrients with them (Section 4.12.6.1., Supporting Information Document). The Project Owners recognize that fish passage may become feasible in the future and fish passage is important to NVE, the federal and state agencies, and others who have commented on the Draft Program. Therefore, the Proposed Final Fish and Wildlife Program includes a limited fish passage reopener (Section 4.2). With this limited reopener, if a new, proven methodology or technology becomes available, then the Committee may reevaluate the potential for the construction and operation of fish passage facilities both into and out of Eklutna Lake on its own initiative or at the request of any of the resource agencies or NVE. Fish passage measures must meet certain criteria (see Section 4.2 of the Proposed Final Fish and Wildlife Program).
108	USFWS Enclosure	Page 68	Section 4.5 Fish Passage	A sustainable Eklutna River fishery requires that fish have access to both lateral and headwater habitats. Effects of hydropower development and operation cannot be fully mitigated without reconnecting the river and the lake.	The Proposed Final Fish and Wildlife Program includes a limited fish passage reopener (Section 4.2). With this limited reopener, the Project Owners recognize that fish passage may become feasible in the future and fish passage is important to NVE, the federal and state agencies, and others who have commented on the Draft Program. If a new, proven methodology or technology becomes available, then the Committee may reevaluate the potential for the construction and operation of fish passage facilities both into and out of Eklutna Lake on its own initiative or at the request of any of the resource agencies or NVE. Fish passage measures must meet certain criteria (see Section 4.2 of the Proposed Final Fish and Wildlife Program).
109	USFWS Enclosure	Page 68	Section 4.5 Fish Passage	The Service believes the extent of tributary habitats upstream of Eklutna Lake that are suitable for salmon spawning is significant to the understanding of loss associated with dam construction and operation, and potential gains associated with an alternative that includes fish passage at the dam.	The Proposed Final Fish and Wildlife Program includes a limited fish passage reopener (Section 4.2). With this limited reopener, the Project Owners recognize that fish passage may become feasible in the future and fish passage is important to NVE, the federal and state agencies, and others who have commented on the Draft Program. If a new, proven methodology or technology becomes available, then the Committee may reevaluate the potential for the construction and operation of fish passage facilities both into and out of Eklutna Lake on its own initiative or at the request of any of the resource agencies or NVE. Fish passage measures must meet certain criteria (see Section 4.2 of the Proposed Final Fish and Wildlife Program).
110	USFWS Enclosure	Page 68	Section 4.5 Fish Passage	Also, the Service proposed spill with turbulent attraction flows as an additional downstream passage mechanism that was included in three alternatives (ND-2ST, ND-1ST, and ND-FL7ST). The idea was to use active methods (like water jets and propellors) to generate adequate attraction flows at the dam to support volitional downstream fish passage, all while not impacting the instream flow regime because the attractant flows would be returned to the lake once the juvenile fish reached a bypass gate. This measure was not discussed in the in Draft Program.	This has been included as part of the preferred alternative by USFWS within the Proposed Final Fish and Wildlife Program.

No.	Entity	Page	Section, Table, or Figure	Comment	Response
111	USFWS Enclosure	Page 68	Section 4.5 Fish Passage	Restore wild sockeye salmon runs by implementing mechanisms for fish passage into and out of the lake, expediting the reestablishment of the runs, implementing other lake enhancements that increase nutrients and the quality of and access to spawning habitat, and reducing entrainment at the intake.	The Proposed Final Fish and Wildlife Program includes a limited fish passage reopener (Section 4.2). With this limited reopener, the Project Owners recognize that fish passage may become feasible in the future and fish passage is important to NVE, the federal and state agencies, and others who have commented on the Draft Program. If a new, proven methodology or technology becomes available, then the Committee may reevaluate the potential for the construction and operation of fish passage facilities both into and out of Eklutna Lake on its own initiative or at the request of any of the resource agencies or NVE. Fish passage measures must meet certain criteria (see Section 4.2 of the Proposed Final Fish and Wildlife Program).
112	NVE	Page 69	Section 4.5.1 Lake Studies	The Draft Program significantly discounts the potential of the upper Eklutna tributaries as vital salmon habitat. NVE's TWG 2021-22 Final Report combines traditional ecological knowledge with current surveys and science of the headwaters of the Eklutna River to conclude that there is expansive, preferred habitat for Chinook and coho salmon, which is currently occupied by Dolly Varden, showing its potential. Our report found that the clearwater tributaries for the West Fork have high-quality habitat and that much of the East Fork has suitable habitat in its main stem and tributaries. NVE's Land and Environment Department has concluded that there are over 15 miles of salmon habitat in the upper tributaries.	The Project Owners have acknowledged the habitat in the East and West Forks of Eklutna Creek (Section 4.11.9.1, Supporting Information Document) and coordinated with and included NVE data in their "Eklutna Lake Aquatic Habitat and Fish Utilization Year 2 Study Report", available at eklutnahydro.com.
113	NVE	Page 69	Section 4.5.1 Lake Studies	The Draft Program also significantly discounts the potential of Eklutna Lake as vital salmon habitat. The Draft Program concludes that there was never a large run of sockeye to the lake, pointing to limiting factors such as the lake's turbidity, nutrient levels, and size of kokanee. This current condition may be due to the denial to the lake of marine derived nutrients from salmon carcasses and impacts from the current 40-60 foot biologically devoid varial zone resulting from hydroelectric power water drawdowns around the lake, including such impacts as reduced aquatic vegetation. Moreover, a primary source for the Project Owner's conclusion is a 2017 study, which they greatly misrepresent. The study concluded that its results "can[not be] construed as evidence that [salmon runs to the lake] did not [exist]." The 2017 study, rather, found that, based on the lake's water volume and turnover rate, as many as 15,000 sockeye could have spawned in the lake annually, which is far from an insignificant number. A co-author of the paper recently stated that "[a]nyone who cites the study to argue that Eklutna Lake had no salmon or an "insignificant" number isn't using it scientifically, they are using it politically."	The results of the lake study program, developed in consultation with and concurred with by the Parties, found low primary productivity and apparently unhealthy resident kokanee populations.

No.	Entity	Page	Section, Table, or Figure	Comment	Response
114	NVE	Page 69	Section 4.5.1 Lake Studies	Kleinschmidt Associates surveyed 14 areas totaling 68,512 square ft. around Eklutna Lake that are potentially suitable for sockeye spawning under favorable lake level regimes. These are now largely in the barren varial zone due to 40-60 foot lake drawdowns. However, they contain appropriate slopes, gravel sizes and seeping groundwater or potentially suitable substrate for sockeye spawning, and there may be even more than reported. A total of 331 spawned-out kokanee were observed at Eklutna Lake during the survey period, finding "[s]pawned kokanee ranged from 4.5 – 6.5 inches […]" Alaska Department of Fish and Game ("ADFG") biologists have told us these would grow to normal sockeye size if allowed to develop in the ocean and that these kokanee are likely descendants of a native ocean-run population, since there is no record that they were ever stocked. The Draft Program acknowledges that Trout Unlimited's Alternative and USFWS's Alternative B – modifying the current dam to allow upstream and downstream fish passage – both create significant gains in sockeye spawning habitat, which would come from increased lake spawning habitat.	Thank you for your comment. These potential habitat gains were taken into consideration during the alternatives analysis.
115	NVE	Page 69	Section 4.5.1 Lake Studies	Overall, NVE Land and Environment Department's assessments indicate the following stream miles would be restored by reconnecting the lake and upper tributaries to the lower river and restoring the natural flow regime: 12 miles in the river below the lake, 7 miles in the lake, and 15 miles above the lake in the upper tributaries. NVE Land and Environment Department's measurements are in stream miles, and that metric is used to assess lake habitat, so 7 miles of lake habitat undervalues the actual habitat available for restoration in the lake. These estimates also undervalue habitat off the main channel in the lower river below the lake that could be restored with higher flow releases than are proposed in the Draft Program. Full recovery would therefore restore a minimum of 34 miles of salmon habitat and likely much more taking into account the undervaluing of lake and off channel habitat. The Draft Program, on the other hand, proposes to marginally restore only 11 miles, less than 35% of the conservative estimate of possible salmon habitat in the Eklutna watershed.	Comment noted.
116	ADFG	Page 70	Figure 4-3. Typical spawning Kokanee in Eklutna Lake (left) vs. other lake systems (right).	"other lake systems Kokanee" should be identified by collection location. Is this fish from Alaska or the lower 48? Alaska kokanee are typically smaller than those from warmer systems in the lower 48 and either an Alaskan fish should be presented or the fish identified as from the lower 48 and not necessarily representative of a typical Alaskan kokanee.	Eklutna Lake kokanee were compared to sockeye salmon from four lakes in Alaska (Karluk Lake, Tikchik Lake, Chignik Lake, and Bare Lake) and kokanee from lakes in British Columbia, Montana, and Japan. There is limited data available for kokanee in Alaska because they are less common than ocean-run Sockeye. Location information is provided in Table 4.3-2 of the Eklutna Lake Aquatic Habitat and Fish Utilization Final Year 2 Study Report available at eklutnahydro.com.
117	Eklutna, Inc.	Page 73	4.6 Replacement Dam	We appreciate the Program recognizing Eklutna, Inc.'s contributions to the financial pro forma for the dam replacment. Eklutna, Inc. only reviewed the earth-moving aspects of replacement. It would be advised to seek estimates from industry professionals on the other civil aspects of replacing a dam to ensure the project costs can be trusted.	The cost estimates developed by McMillen were Class V estimates. If the replacment dam is advanced, more detailed engineering will be conducted.

No.	Entity	Page	Section, Table, or Figure	Comment	Response
118	Eklutna, Inc.	Page 73	4.6 Replacement Dam	We request a detailed discussion on the financial implcations of dam replacement and the accuracy of revenue generation estimates. During project meetings, revenue figures for the utilities benefiting from the water in Eklutna Lake have been bandied about without an explanation or details. We request to include a section on the specific economics of the project. This is likely public information that should be easily attainable to provide to the public as part of their Program review.	Details were provided at alternative analysis meetings and were repeated in Appendix D of the Draft Fish and Wildlife Program and Appendix C of the Supporting Information Document. Presentations from the alternatives analysis meetings are available on the project website at eklutnahydro.com.
119	ADFG	Pages 74-75	4.8 Physical Habitat Manipulation	Physical habitat manipulation should be incorporated into this draft plan. While there is potential federal funding for this, there is no guarantee that this outside funding can be secured. To ensure that this plan will effectively promote the anticipated positive effect on fish and their habitats physical habitat improvements should be included.	Physical Habitat enhancement is included in the Proposed Final Fish and Wildlife Program (Section 3.3.6). The Project Owners will provide a total of $350,000 in April 2024 dollars to ADFG during the Program to fund physical habitat enhancement and vegetation management efforts in the Eklutna River. The Committee will develop a plan to implement physical habitat enhancement and vegetation management efforts in the Eklutna River.
120	ADFG	Pages 74-75	4.8 Physical Habitat Manipulation	Additionally, woody vegetation has encroached on the channel due to limited flows. The impacts of the vegetation in the channel, after some flow is returned to the river, should be assessed to determine if this vegetation needs to be managed to fully realize the projected habitat gains presented in the plan.	Physical Habitat enhancement is included in the Proposed Final Fish and Wildlife Program (Section 3.3.6). The Project Owners will provide a total of $350,000 in April 2024 dollars to ADFG during the Program to fund physical habitat enhancement and vegetation management efforts in the Eklutna River. The Committee will develop a plan to implement physical habitat enhancement and vegetation management efforts in the Eklutna River.
121	USFWS	Pages 74-75	4.8 Physical Habitat Manipulation	Include physical habitat manipulation as components in both the Program as well as in the Adaptive Management Plan.	Physical Habitat Enhancement is included in the Proposed Final Fish and Wildlife Program (Section 3.3.6). The Project Owners will provide a total of $350,000 in April 2024 dollars to ADFG during the Program to fund physical habitat enhancement and vegetation management efforts in the Eklutna River. The Committee will develop a plan to implement physical habitat enhancement and vegetation management efforts in the Eklutna River.
122	USFWS Enclosure	Pages 74-75	4.8 Physical Habitat Manipulation	The Draft Program excludes any physical habitat manipulation that would adjust the river to the new flow regime because, it says, Federal funding is being pursued for this work. However, the Service believes physical habitat manipulation should be included in the Program because it will be important mitigation for the impacts of the project, and because grant funding is not guaranteed. Habitat manipulation should be included in the Adaptive Management Program since funding, designing, and implementing projects will require a collaborative strategy to ensure concerns are addressed and habitat goals are met.	Physical Habitat Enhancement is included in the Proposed Final Fish and Wildlife Program (Section 3.3.6). The Project Owners will provide a total of $350,000 in April 2024 dollars to ADFG during the Program to fund physical habitat enhancement and vegetation management efforts in the Eklutna River. The Committee will develop a plan to implement physical habitat enhancement and vegetation management efforts in the Eklutna River.
123	USFWS Enclosure	Pages 74-75	4.8 Physical Habitat Manipulation	Create self-sustaining instream, off-channel, and lake habitat for fish and wildlife. Design instream and floodplain habitat enhancements so that the channel is fitted to the watershed hydrology and sediment loads so that there is channel complexity, floodplain and wetland connectivity, and riparian function.	Physical Habitat enhancement is included in the Proposed Final Fish and Wildlife Program (Section 3.3.6). The Project Owners will provide a total of $350,000 in April 2024 dollars to ADFG during the Program to fund physical habitat enhancement and vegetation management efforts in the Eklutna River. The Committee will develop a plan to implement physical habitat enhancement and vegetation management efforts in the Eklutna River.

No.	Entity	Page	Section, Table, or Figure	Comment	Response
124	ADFG	Page 75	4.9 Lakeside Trail Repairs	Regardless of funding secured by the State of Alaska to address current damage to the trail system, additional funding should be dedicated to remediating any additional trail damage that occurs as a result of project operations.	In the Proposed Final Fish and Wildlife Program, the Project Owners will provide a one-time payment of $234,000 to Chugach State Park for lakeside trail repairs that address erosion impacts.
125	USFWS Enclosure	Page 75	4.9 Lakeside Trail Repairs	Improve water quality at the lake by implementing measures to stabilize banks.	During past spill events, high lake levels have caused erosion along discrete segments of the lakeside trail. Chugach State Park has received $234,000 in funding for general lakeside trail repairs. Within 120 days of the Governor's approval or by January 31, 2025, whichever comes later, the Project Owners will provide a one-time payment of $234,000 to Chugach State Park (or another entity as directed by Chugach State Park) for lakeside trail repairs that address erosion impacts. This funding match brings the total budget for lakeside trail repairs to $468,000.
6.0 Next Steps					
126	Eklutna, Inc.	Page 80	Governor's Issuance of a Final Fish and Wildlife Program	The Program outlines the remaining process for public review and the Governor's decision on the final Program. The utility-driven public process is understood, but the Governor's Public Interest Determination (Determination) process is not well-defined. The Program alludes to the Alaska Energy Authority leading the State evaluation process; however, that agency would be an unlikely conadidatefor executing a public process and delivering a decision on the Governor's behalf. We request greater clarity on which agency or division within the State of Alaska will be responsible for the public process and the Gevernor's Determination decision.	The Governor assigned AEA as the Governor's representative for the project. AEA has attended all stakeholder meetings throughout the process and will advise the Governor. The Project Owners have faithfully implemented the process outlined in the 1991 Agreement and will be submitting the Proposed Final Fish and Wildlife Program to the Governor. The Project Owners defer to the Governor with respect to how the State of Alaska implements the Governor's review and approval process.
127	NVE	Page 81	Section 6.6 Additional Requirements to Implementing the Fish and Wildlife Program	The Draft Program states that there may be additional requirements to implementing the Program, including the potential need to secure permits, land rights, easements and Amendment of ADL 44944.103 However, it does not describe any strategies the Project Owners have developed for securing necessary permits or land rights for the Draft Program or any alternatives. Instead, the Draft Program document flatly states, "[s]hould any of these requirements fail to be achieved, the Project Owners will not be able to execute on the Fish and Wildlife Program."	A Final Fish and Wildlife Program is needed to pursue these additional requirements. The 1991 Agreement schedule allows for 3 years after the governor's approval to for the Project Owners to obtain these additional requirements.
128	NVE	Page 81	Section 6.6 Additional Requirements to Implementing the Fish and Wildlife Program	There is no basis for the Project Owners' suggestion that their inability to satisfy any "additional requirements" for implementation of the Program is a legitimate basis for their non-performance under the Agreement. Instead, the likelihood of the Project Owners being able to secure permits and property rights necessary for successful implementation of the Draft Program and reasonable alternatives is relevant to the alternatives analysis.	As with any project of this nature, we will have to obtain permits, land rights, and easements, and water rights amendents to implement the Final Fish and Wildlife Program. We see no reason why we will not be able to achieve the such additional requirements that are preconditions to our ability to implement the Fish and Wildlife Program.

No.	Entity	Page	Section, Table, or Figure	Comment	Response
129	NVE	Page 81	Section 6.6 Additional Requirements to Implementing the Fish and Wildlife Program	Based on our review, there are several issues related to the Project Owners' ability to secure permits for the Draft Program. The 15% design drawings included in the Draft Program show that the construction of the proposed AWWU Portal would include construction of above ground utility infrastructure as well as eight new bridges and road improvements for the AWWU water supply access road within Chugach State Park. Such construction within the State Park would be a "conversion" of Land and water Conservation Fund property requiring approval by the Department of Interior ("DOI"). Further, any DOI decision approving conversion would be a federal action requiring compliance with NEPA and ESA section 7.	The Land and Water Conservation Fund implications were discussed in the July 2023 Alternatives Analysis meeting. We agree a DOI decision regarding a conversion would be a federal action requiring compliance with NEPA and ESA Section 7.
130	NVE	Page 81	Section 6.6 Additional Requirements to Implementing the Fish and Wildlife Program	Additional review of the 15% design drawings shows that the Draft Program includes the addition of riprap fill material directly into the Eklutna River channel at the location of the AWWU Portal discharge, which would be subject to compliance with Clean Water Act section 404 and may require an individual permit from U.S. Army Corps of Engineers. Such permitting decisions would also be a federal action subject to compliance with NEPA and ESA section 7.	The Project Owners are aware of the potential need for a Clean Water Act permit from the U.S. Army Corps of Engineers and agree that such permitting decisions would also be a federal action subject to compliance with NEPA and ESA section 7.
131	NVE	Page 81	Section 6.6 Additional Requirements to Implementing the Fish and Wildlife Program	The Project Owners need to address these and any other permitting requirements and pathways for the proposed AWWU Portal as compared to dam removal and any other reasonable alternatives for the Parties, the public, and the Governor to make informed comments and decisions, respectively.	A Final Fish and Wildlife Program is needed to pursue these additional requirements. The 1991 Agreement schedule allows for 3 years after the governor's approval to for the Project Owners to obtain these additional requriements.
General					
132	NVE			NVE was not consulted in the negotiation of the Agreement and is not a party to the Agreement. Rather than rectify that historic injustice, the Project Owners denied our request to be formally recognized as a consulting government and for treatment as a party to the Agreement during this process. The Project Owners' decision appears based on their preference and convenience rather than any legal or moral principle.	In April 2020, NVE requested formal recognition as a consulting government, with their Land and Environment Department analogous to other governmental signatories, for purpose and processes of the 1991 Agreement applicable to the Project. In a May 2020 letter to the Project Owners, NVE recognized that amending the 1991 Agreement may entail substantial time and effort, and as an alternative invited a joint letter from the Project Owners to the effect that the Project Owners will act in good faith to help mitigate impacts to the Eklutna River and that the Project Owners will recognize NVE as a consulting government on a basis comparable to the governmental signatories to the 1991 Agreement. In June 2020, the Project Owners responded to NVE's request by committing to a review and participation framework that ensures information NVE and its members share regarding the Eklutna River and development of the Fish and Wildlife Program is appropriately considered and addressed.

No.	Entity	Page	Section, Table, or Figure	Comment	Response
133	NVE			The Project Owners describe their voluntary efforts to meet with and consider information provided by NVE, but these efforts offer no substitute for party status or treatment of NVE as a consulting government. For example, after explaining that NVE is not entitled to participate in the consultation process under the Agreement, the Project Owners promise that "if the process set forth in the Agreement bears out the release of water from Eklutna Lake and the addition of salmon into the Eklutna River as part of the Fish and Wildlife Program, we will be prepared to support it." This is not a promise NVE can or should be asked to rely upon given that the Project Owners have substantially different interests than NVE, have exerted total control over the consultation process, and have excluded NVE from full participation in that process.	NVE has been involved in every step of the process including the initial consultation meetings, all four Technical Work Groups (TWGs), the alternatives analysis, and attempts to resolve differences. The Project Owners have also met with the NVE Tribal Council on several occasions, including meetings with the Boards of Directors for both CEA and MEA and the Anchorage Assembly. Based on the study results, the Project Owners made a commitment early in the alternatives analysis process to provide year-round flow releases into the Eklutna River, which was the basis of the draft program and continues to be the basis of the proposed final program.
134	NVE			The Eklutna River ecosystem, including its fish and wildlife resources and particularly its salmon runs, is fundamental to the historical properties and traditional and cultural resources of the Eklutna People. The dewatering of the river and destruction of salmon are adverse effects of the Project that have already degraded and threaten to destroy the significance of these properties and resources. The Project Owners are required to afford protection to these cultural resources.	Comment noted.
135	NVE			Eklutna Dena'ina's health, families, and culture depend on restoring salmon to the Eklutna River. Rather than fully evaluate alternatives that would avoid, minimize, or mitigate the project's adverse effects, as would generally be required for the relicensing of any other similarly-sized non-federal hydropower project, the Project Owners have put forward a Draft Program that would maintain those adverse effects by continuing to dewater a portion of the lower Eklutna River and deny salmon access to the majority of the system's salmon habitat for the next 35 years. The Draft Program shows that the Project Owners did not fully evaluate alternatives that would mitigate and enhance, let alone avoid or minimize the Project's ongoing impacts to sockeye, Chinook, and coho salmon habitat even though the loss of the sockeye salmon run was one of the express reasons for the Agreement.	The alternatives analysis was very comprehensive, up to and including the dam replacement alternative (Section 4.5, Supporting Information Document).

No.	Entity	Page	Section, Table, or Figure	Comment	Response
136	NVE			If the Project had not received a unique exemption from federal regulation, FERC, with assistance from the Project Owners, would be required to follow specific procedures in consulting with NVE under the National Historic Preservation Act ("NHPA") section 106 before deciding whether to continue or modify project facilities or operations over the next 30-year term. In overseeing the Section 106 consultation process, FERC would be required to evaluate and reach agreement with NVE and other consulting parties on "ways to avoid, minimize or mitigate the adverse effects" of the Project. In other words, the range of alternatives and alternative measures considered in a Section 106 process would not be limited to only those advantageous to the Project Owners. Also, NVE would have a role in overseeing and enforcing the Project Owners' compliance with any agreement resolving the Project's adverse effects.	The required process was not a FERC licensing process but rather the 1991 Agreement required a very specific set of actions by the Project Owners to study and evaluate potential protection, mitigation, and enchancement measures for addressing the project's effects on fish and wildlife resouces.

Technical Memorandum

To:	Eklutna Project Owners	Project:	Eklutna Fish & Wildlife Program
From:	Sean P. Ellenson, P.E. McMillen, Inc.	cc:	Samantha Owen McMillen, Inc.
Date:	April 24, 2024	Job No:	24-021
Subject:	Technical Risk Assessment of the Removal of Eklutna Dam		

Revision Log

0	03/22/2024	Initial Draft
1	04/05/2024	First Draft for Circulation
2	04/22/2024	Final Draft

1.0 Introduction

The Eklutna Hydroelectric Project (Project) is located in Southcentral Alaska approximately 30 miles northeast of downtown Anchorage near the Native Village of Eklutna (NVE). The Project was originally constructed by the Federal government in the 1950s but was later sold to and is currently owned by Chugach Electric Association (Chugach), Matanuska Electric Association (MEA), and the Municipality of Anchorage (MOA), collectively the "Project Owners". As part of the sale of the Project, the current Project Owners entered into the 1991 Fish and Wildlife Agreement (1991 Agreement) with the National Marine Fisheries Service (NMFS), U.S. Fish and Wildlife Service (USFWS), and the State of Alaska (the Parties). The 1991 Agreement requires the Project Owners to develop and propose to the Governor of Alaska (Governor) a program to protect, mitigate damages to, and enhance fish and wildlife impacted by the development of the Project.

1.1 Background

Beginning in 2019, the Project Owners consulted with agencies and interested stakeholders regarding the availability of existing information and development of a study program. This study program took place over the course of two years to investigate the impact of the Project on fish and wildlife. The results of the study program indicated that releasing water back into the Eklutna River would provide benefits to fish and wildlife, particularly in terms of providing

new fish habitat. Subsequently, the Project Owners began an alternatives analysis process to determine potential methods to provide water into the Eklutna River as well as other protection, mitigation, and enhancement (PME) measures as part of the future Fish and Wildlife Program.

Ultimately the alternatives analysis process evaluated over 36 comprehensive alternatives proposed by agencies and stakeholders. A cost effectiveness and incremental cost analysis was performed to identify the relative benefits and costs of each measure to help narrow down the list of proposed alternatives. The final list of preferred alternatives proposed by each participant in the alternatives analysis effort encompassed variations on infrastructural improvements (i.e. upstream and downstream fish passage, spillway gates, water release facilities in the river), flow release regimes, and habitat improvement measures to mitigate impacts from the Project. The alternatives analysis and selection of a preferred alternative was presented in the Draft Fish and Wildlife Program (Draft Program) published in October 2023[1].

Following the publication of the Draft Program, the NVE proposed a new alternative that involves the removal of Eklutna Dam. Per their comments on the Draft Program dated December 4, 2023:

> "To meaningfully meet the purpose of the Agreement, NVE proposes an alternative solution – removing the Eklutna Lake dam within ten years when sufficient renewable power generation is available to offset the lost power generation from dam removal."[2]

In response to the letter, the Project Owners committed to studying the alternative of dam removal in further detail. This memorandum aims to document a segment of this analysis.

1.2 Purpose

The purpose of this memorandum is to conduct a high-level analysis of the technical risks and cost implications associated with the removal of Eklutna Dam. This investigation evaluates the effects that an unregulated river hydrograph may have on infrastructure on or adjacent to the Eklutna River downstream of the existing dam, summarizes the costs associated with dam removal and decommissioning of Project infrastructure, investigates potential mitigation measures where necessary to address such risks, and analyzes the use of other comparable

renewable energy sources to determine how to offset the lost generation and ancillary grid services provided by the Eklutna Power Plant. It is pertinent to note that the primary objective of this memorandum is to analyze the technical risks and mitigation measures linked to the dam's removal from an engineering standpoint and explicitly excludes discussions related to the ecological advantages or the potential effects on fish and wildlife habitat.

1.3 Organization

This memorandum is organized into the following sections:

Section 1 – Introduction
Discusses the purpose of the memorandum, the scope of the assessment, and the background of the project.

Section 2 – Eklutna River Hydrology
Summarizes the analysis performed on the Eklutna River watershed to estimate the average annual and predicted peak flow rates of the Eklutna River if the dam were to be removed.

Section 3 – Description of Alternative
Summarizes the scope of the dam removal alternative.

Section 4 – Risk Assessment and Mitigation Strategies
Summarizes the impacts to infrastructure associated with the project and analyzes the mitigation measures necessary following dam removal.

Section 5 – Preliminary Cost Estimates
Summarizes the cost estimates associated with the dam removal and modifications to associated infrastructure.

Section 6 – Risk Assessment Summary
Provides conclusions and an overall summary of the assessment performed.

2.0 Eklutna River Hydrology

Under the proposed scenario where the Eklutna Dam is removed, the Eklutna River would flow year-round in an unregulated state. To assess potential impacts to infrastructure along the river, an improved understanding of the hydrology of the Eklutna watershed is necessary to determine the typical annual hydrograph and peak flood flows expected post-dam removal. As part of the study program, a hydropower operations model was created for the Project that simulated reservoir and power plant operations to calculate historical inflows to the Eklutna watershed from 2011 to 2021. The modeling is based on the stage-storage information of Eklutna Lake, stage gauging information recorded by the United States Geological Survey (USGS), and measured outflows to the Eklutna Power Plant and to the Eklutna Water Treatment Facility (EWTF). The development of this operations model is summarized in the Hydropower Operations Modeling Study Report published in February 2022[3].

Figure 1.3-1. Location Map - Eklutna Lake Outlet.

To simulate the unregulated streamflow condition in the Eklutna River, the model was modified to consider the removal of Eklutna Dam. As an initial step in this scenario, all water withdrawals from the reservoir were curtailed, including both the power plant withdrawal and the EWTF flow diversion from the intake structure. Rather than the lake being regulated up to a maximum water surface elevation (WSEL) of El. 871.0 (Local Datum[4]) the reservoir would

[3] Chugach Electric Association, Matanuska Electric Association, Municipality of Anchorage. Eklutna Hydroelectric Project Hydropower Operations Modeling Draft Study Report. (February 2022) https://eklutnahydro.com/wp-content/uploads/2022/06/2022-2-11-Eklutna-Study-Report_Hydro-Model_DRAFT.pdf

[4] Multiple vertical survey datums are reported in and around the main features of the Project. Throughout this document, the elevation datum that shall be used is the "local datum" tied to the crest of Eklutna Dam.

flow naturally into the Eklutna River at a minimum WSEL of El. 860.0, corresponding to the elevation of the natural glacial moraine crest located at the remnants of the previous storage dam. The only regulation of streamflow from the reservoir under this proposed scenario would be due to the constriction of the outlet of the lake downstream of this natural crest. A location map identifying key features at the lake outlet is provided in Figure 1.3-1.

With the dam removed and the lake discharging in an unregulated state through its outlet, a stage-discharge relationship of the lake outlet was developed to understand the magnitude and seasonal variation of flow within the Eklutna River. The one-dimensional (1-D) HEC-RAS model developed as part of the study program was modified to determine the WSEL within the natural bend in the lake outlet at varying flow rates without a dam restricting discharge. The development of this model is summarized in the Eklutna River Instream Flow Year 2 Study Report published in June 2023[5]. The stage-discharge relationship of the lake outlet is illustrated graphically in Figure 1.3-2.

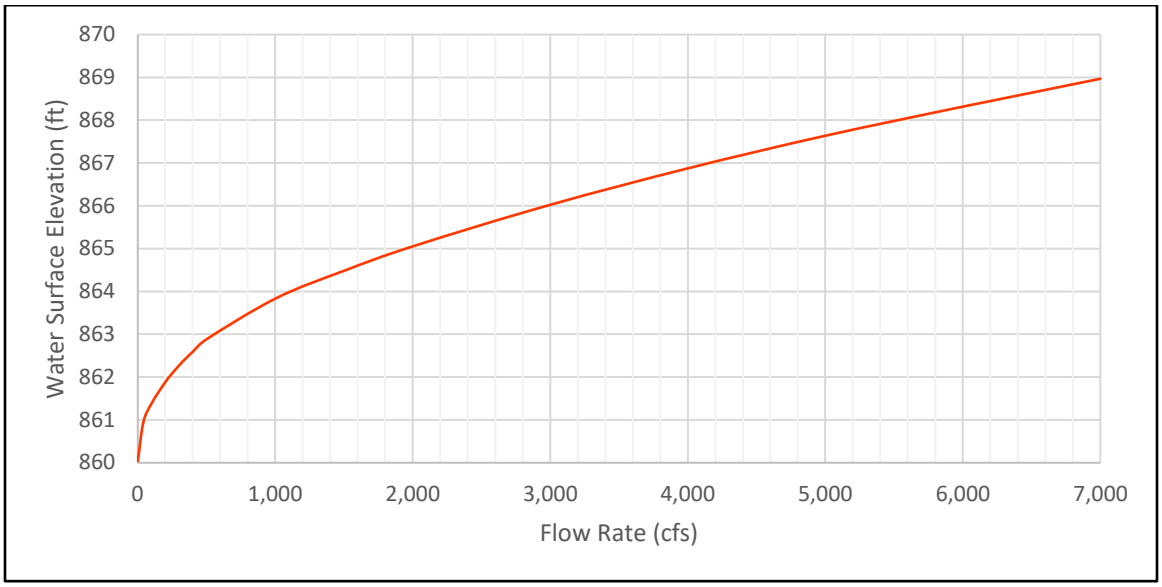

Figure 1.3-2. Stage Discharge Relationship; Eklutna Lake Outlet.

With the inflows to the lake calculated based on historical operating data and the hydraulic constriction at the outlet of the lake better understood, the natural seasonal fluctuation of the lake and the Eklutna River hydrograph were developed. The predicted streamflow of the Eklutna River in a daily timestep from 2011 to 2021 is presented in Figure 1.3-3 and the average seasonal lake fluctuation is presented in Figure 1.3-4.

https://eklutnahydro.com/wp-content/uploads/2023/06/Eklutna-Instream-Flow-Y2-Report_FINAL.pdf

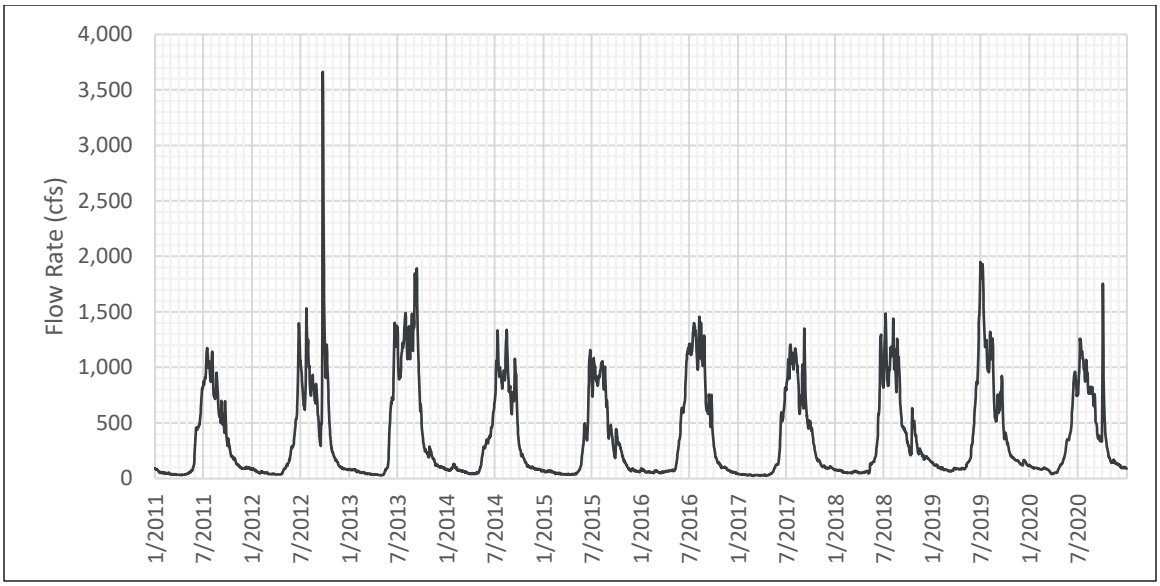

Figure 1.3-3. Eklutna River Unregulated Flow Rate; 2011-2021 Simulation.

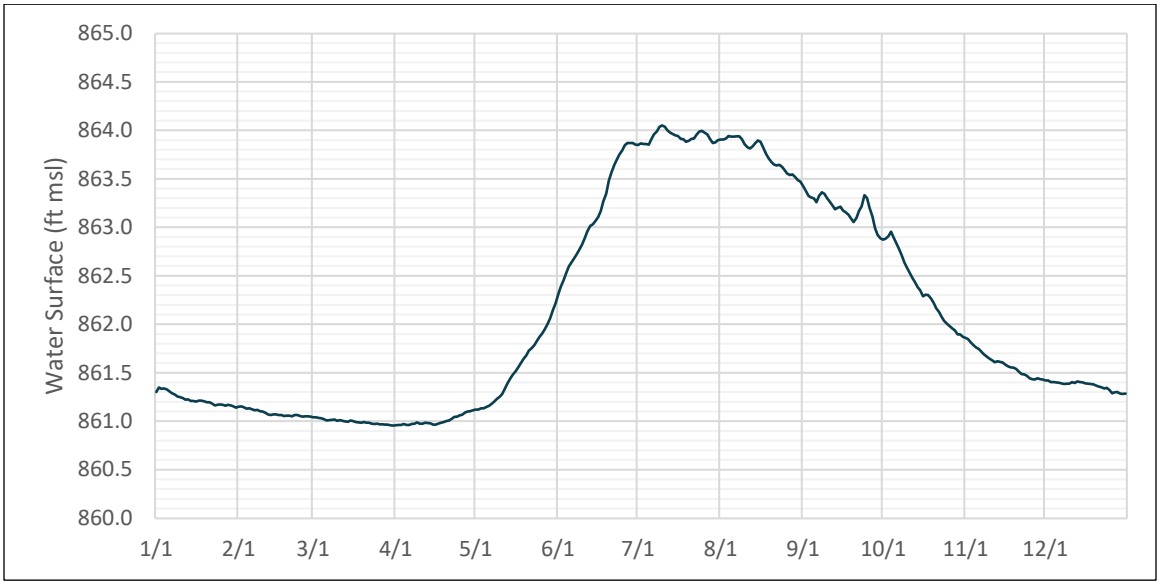

Figure 1.3-4. Eklutna Lake Average WSEL Post-Dam Removal.

Under the dam removal alternative, the Eklutna River would see an average peak flow of approximately 1,200 cubic feet per second (cfs) each year and the lake would fluctuate an average of 3-4 ft each year. The flow rate in the river during the winter months ranges from approximately 30-70 cfs.

To determine the flood magnitude for longer interval events, such as the 25-, 50-, and 100-year return interval storms, regional regression equations were utilized, as published by Curran

et al[6]. The regional regression equations are based on a selected annual precipitation depth and watershed drainage area. The analysis was performed at two locations in order to calculate the peak flood events both above and below Thunderbird Creek, the primary tributary to the Eklutna River, the results of which are presented in Table 1.3-1 and Table 1.3-2.

Table 1.3-1. Eklutna River Flood Frequency Peak Flow Rates; Above Thunderbird Confluence.

Return Interval	Annual Exceedance Probability (%)	Peak Flow (cfs)	Lower 90% Prediction Interval (cfs)	Upper 90% Prediction Interval (cfs)
2	50%	2,360	826	6,740
5	20%	3,400	1,220	9,510
10	10%	4,150	1,480	11,600
25	4%	5,110	1,790	14,600
50	2%	5,840	2,000	17,000
100	1%	6,590	2,210	19,600
200	0.5%	7,350	2,390	22,600
500	0.2%	8,370	2,590	27,100

Table 1.3-2. Eklutna River Flood Frequency Peak Flow Rates; Below Thunderbird Confluence.

Return Interval	Annual Exceedance Probability (%)	Peak Flow (cfs)	Lower 90% Prediction Interval (cfs)	Upper 90% Prediction Interval (cfs)
2	50%	2,650	928	7,570
5	20%	3,840	1,370	10,700
10	10%	4,690	1,680	13,100
25	4%	5,790	2,030	16,500
50	2%	6,610	2,270	19,300
100	1%	7,460	2,510	22,200
200	0.5%	8,330	2,710	25,600
500	0.2%	9,480	2,930	30,700

[6] Curran, J.H., Barth, N.A., Veilleux, A.G., and Ourso, R.T.,2016, Estimating Flood Magnitude and Frequency at Gaged and Ungaged Sites on Streams in Alaska and Conterminous Basins in Canada, Based on Data through Water Year 2012: U.S. Geological Survey Scientific Investigations Report 2016-5024, 47 p.

For the purposes of assessing the risks to infrastructure on or adjacent to the Eklutna River downstream of the dam as outlined in Section 4.0, the 1% annual exceedance probability (AEP) was utilized as the design basis flow rate, an industry standard for assessing impacts to bridges and other critical infrastructure. This equates to a flow of 6,590 cfs for infrastructure located above the confluence of Thunderbird Creek, and 7,460 cfs for all infrastructure below the Thunderbird Creek confluence.

In 2018, the USFWS conducted a peak flow analysis for the Eklutna River using the Log Pearson III technique outlined in USGS Bulletin 17B[7]. This analysis utilized eight years of historical gage data from the river before the current dam's construction. By applying various skew coefficients, the study developed a range of potential flood frequency flows. The selected skew coefficient indicated a 1% AEP flood flow of 3,436 cfs.

Although the USGS Bulletin 17B's methodology of fitting flow data to a statistical distribution is valid and typically an accurate estimation of AEPs, it requires at least a 10-year record from a gaged stream, which the Eklutna River lacks. Consequently, the regional regression equations proposed by Curran et al., which calculate peak flows based on watershed drainage area and mean annual precipitation, were considered more suitable for this analysis.

[7] USFWS. 2018. Appendix B - Eklutna River Peak Flow Estimates – USGS Gage 15280000, July 1947 – August 1954. https://www.tu.org/wp-content/uploads/2019/06/Upper-Eklutna-Flow-Assessment-071419-1.pdf

3.0 Description of Alternative

This section defines the necessary infrastructural modifications to Project facilities as part of the proposed dam removal alternative. The following subsections document the assumptions regarding modifications to the Eklutna Dam and to the Eklutna Power Plant, as well as a discussion on the development of alternative energy sources to replace the lost energy from the Project.

3.1 Eklutna Dam

3.1.1 General Description

Figure 3.1-1. Eklutna Dam Looking Upstream.

Eklutna Dam is a zoned earth and rockfill structure with a crest length of 815 ft, a crest elevation of 891.0 ft, and a maximum height above the streambed of 41 ft. The embankment volume is approximately 85,000 cubic yards (CY) of material consisting primarily of clay, silt, sand, and gravel with a rockfill embankment cover. The upstream and downstream rockfill slopes are 3H:1V and 2H:1V, respectively. An 83-ft-wide berm of rockfill was constructed at El. 856.5 ft on the downstream toe of the dam. The structural height (maximum height above the deepest excavation) is 56 ft. The spillway is located near the middle of the dam and consists of a riprap-lined approach channel, concrete inlet structure, ungated ogee-type weir, rectangular concrete conduit through the embankment, concrete-lined chute, concrete stilling basin, and riprap-lined outlet channel. The concrete volume is approximately 3,000 CY.

3.1.2 Work Plan

To facilitate dam removal, construction access improvements would need to be performed at select roads leading to the dam site. The unnamed access road leading to the right abutment

of the dam would need to be widened, graded, and re-surfaced to allow for heavy equipment access. Construction access roads utilized during the original construction of the dam would need to be cleared of vegetation, re-graded, and re-surfaced to allow for the loading and transport of excavated materials off-site.

The work would take place with the reservoir drawn down below El. 860.0 and would likely occur over one full construction season. For this to occur with the reservoir drawn down, the work would likely take place in early summer when ground conditions allow for heavy machinery transport and site access. All embankment material, riprap, and concrete would be removed and the Eklutna River channel would be restored to its natural state. The remnants of the previous storage dam upstream of Eklutna Dam are anticipated to be left as-is. For the purposes of the cost estimate and based on discussions with Eklutna, Inc., all material is anticipated to be disposed of in the quarry located between the railroad bridge and New Glenn Highway, approximately 10 miles from the Project site.

3.2 Eklutna Powerplant

3.2.1 General Description

Figure 3.2-1. Eklutna Powerplant as Viewed from Old Glenn Highway.

The Eklutna Power Plant is a reinforced concrete structure located adjacent to the Old Glenn Highway 34 miles northeast of Anchorage. The structure is 149 ft long with a height of approximately 51 ft and houses two vertical shaft hydroelectric turbine-generators. The power plant is divided into three main structures: the powerhouse containing the generating units and accessories, the machine shop located at the northwest corner of the powerhouse, and the transformer structure located at the southwest corner of the powerhouse. The switchyard of the power plant is located on the powerhouse roof.

3.2.2 Work Plan

Under the dam removal scenario, the Eklutna Power Plant would need to curtail operations between November and June in an average year to prevent cutting off flow to the Eklutna River. During the remaining five months when inflows to the lake are sufficient to allow the hydroelectric system to operate, the power plant would need to operate at a reduced capacity in a baseload, run-of-river configuration, subject to instream flow and ramping rate considerations. Preliminary discussions with the Project Owners indicate that the maintenance costs of having the power plant sit idle for seven months each year in addition to the significant reduction in operational flexibility and energy generation in the summer months would lead the Project to be uneconomical to continue to operate. For the purposes of this technical risk assessment, the assumption is that the power plant would be decommissioned, but not removed, under the dam removal scenario.

To decommission the power plant, the fixed wheel gate within the power tunnel surge tank shaft would be closed and the penstock and draft tube would be dewatered and drained. All powerhouse mechanical and electrical equipment and hazardous material would be removed and disposed of. Embedded oil lines and septic systems would be flushed, and all surface mounted and exposed lines would be removed. Downstream of the surge shaft, a concrete plug would be anchored into the bedrock at the penstock transition to seal the power plant from the lake.

The power plant decommissioning work plan assumes that the power plant would remain abandoned in place and gated to prevent vandalism, intrusion, and ensure public safety. The Project Owners and/or insurers may require demolition of the facility to reduce risk to the public under all future conditions, which has not been considered as part of the cost estimation in Section 5.0. Should this alternative be explored further, it's imperative to conduct a comprehensive assessment, which would involve evaluating the feasibility of reutilizing the existing switchyard and thoroughly analyzing the liabilities connected with leaving the power plant site abandoned, in order to identify the most prudent approach.

3.3 Renewable Energy Supply

3.3.1 General Description

The Eklutna Power Plant has a nameplate capacity of 44.4 MW and generates an average of 169 GWh of energy each year for the Alaskan Railbelt electrical grid. Under the dam removal scenario, the facility would cease operation. The loss of this power generation resource would reduce the size of the renewable energy portfolio for both Chugach and MEA. Additionally, the loss of this resource would violate MEA's capacity reserve margin requirement. This reserve is

a North American Electric Reliability Council (NERC) guideline that has been adopted by the Intertie Management Committee (IMC) and is intended to allow each utility to meet demand during an unplanned loss of generation in the system.

With the loss of the Eklutna Power Plant as a generating resource, the power would need to be replaced with another equivalent resource. While the possibility exists to add or expand to the existing fossil fuel generation fleet in the Railbelt, this would not be beneficial to or achieve the goals of future state policies being considered such as a renewable portfolio standard (RPS)[8] or existing utility board goals. This fact is recognized by NVE in their proposed alternative, requiring the development of renewable generation projects to offset the lost energy from the Eklutna Power Plant. Some renewable generation projects such as those which utilize wind or solar as the renewable resource are not considered equivalent to a hydroelectric project as they are not firm, dispatchable sources of energy.

The benefit the Eklutna Power Plant provides to the grid as a hydroelectric project coupled with a reservoir with seasonal storage capacity makes it a unique generating resource. With the power plant online, the utilities have a firm spinning reserve that has the ability to load follow and regulate other renewables in the Railbelt. Additionally, the Railbelt has relatively low system inertia, making it susceptible to swings in voltage and frequency as load comes online or generation is lost. The Eklutna Power Plant provides a significant source of grid inertia to stabilize the grid. To replace this resource, another renewable source of generation that can provide spinning reserves to the grid is necessary, such as another hydroelectric project with a reservoir capable of seasonal storage. The site selection and conceptual design of an equivalent hydroelectric project is well beyond the scope of this technical risk assessment; however, high level estimates may be made as part of this analysis to estimate costs for a project of similar capacity.

4.0 Risk Assessment and Mitigation Strategies

This section assesses the technical risks to infrastructure located below the dam following the establishment of unregulated flows into the Eklutna River as well as other impacts to related infrastructure that are dependent on the current reservoir and power plant operations. Following the identification of risks, this section surveys potential mitigation alternatives for those risks if mitigation is necessary.

4.1 AWWU Water Supply Infrastructure

4.1.1 General

In 1988 the Anchorage Water and Wastewater Utility (AWWU) constructed the Eklutna Water Project, which diverts water from the existing tunnel connecting Eklutna Lake with the Eklutna Power Plant. Water flows by gravity through a separate diversion tunnel intersecting the power tunnel downstream of the intake and routes water into a buried pipeline running down the Eklutna River valley to a water treatment plant located on a bench above the river. Following treatment, the water flows by gravity through a 23-mile-long buried pipeline to supply 90% of the municipal water supply to the Anchorage service area.

4.1.2 Risk Assessment

To assess the risks associated with AWWU infrastructure following dam removal, an assessment was performed on the water supply pipeline within the Eklutna river channel, the maintenance and access road along the pipeline, the AWWU maintenance bridges crossing the river, and on the sufficiency of inflows to the reservoir to supply a year-round municipal water supply source for the utility. These were some of the primary concerns documented by AWWU in a February 2024 letter in response to the dam removal alternative[9]. The following subsections document this analysis.

4.1.2.1 Scour Analysis

A 2-dimensional (2-D) HEC-RAS model was developed for the Eklutna River from the Eklutna Dam to the mouth of the river at the Knik Arm of the Cook Inlet. The model was set up to investigate sediment mobilization at locations where the AWWU pipeline would be inundated by hypothetical future river flows. Understanding sediment mobilization will determine if the riverbed has the potential to scour the area of the pipeline. A flow rate of 6,590 cfs was

[9] Corsentino, Mark. “Re: Assessment of Dam Removal”. February 1, 2024. Anchorage Water & Wastewater Utility General Managers Office.

utilized as the hydraulic design basis, corresponding to the 1% AEP flood as described in Section 2.0.

The critical diameter (largest diameter of the substrate that can be moved under given flow conditions) was computed for each cell in the 2-D model output using the method described in Appendix B of Engineering Manual 1110-2-1418[10]. This method is based upon the Manning's equation and assumes a Shields number of 0.045, and roughness height (k) equal to 3 times the median grain size (D_{50}). For this analysis, the Shields number was adjusted to 0.03 based on a study of bed-load transport in similar gravel bed streams, as utilized in the Geomorphology and Sediment Transport Study published in 2022[11]. The critical diameter as a function of velocity and water depth was computed in accordance with the following equation:

$$D_{crit} = 0.686 \frac{V^3}{\sqrt{d}}$$

Where:

D_{crit} = Critical Diameter (mm)
V = Velocity (ft/s)
d = Depth (ft)

To predict sediment mobilization throughout the streambed, a D_{50} of 18-mm was estimated based on the average gradation from a representative transect (Transect C) as collected in October 2021. A map of the scour potential of the riverbed was developed, color coded based only on sizes greater than or equal to a D_{50} of 18-mm (0.71 inches). A graphical representation of the grain size mobility within the riverbed under the 1% AEP flood is presented in Figure 4.1-1 and Figure 4.1-2.

[10] United States Army Corp of Engineers. Channel Stability Assessment for Flood Control Projects. EM 1110-2-1418.
[11] Chugach Electric Association, Matanuska Electric Association, Municipality of Anchorage. Eklutna Hydroelectric Project Geomorphology and Sediment Transport Year 2 Report. (June 2022). https://eklutnahydro.com/wp-content/uploads/2023/06/Eklutna-Geomorphology-Report_FINAL.pdf

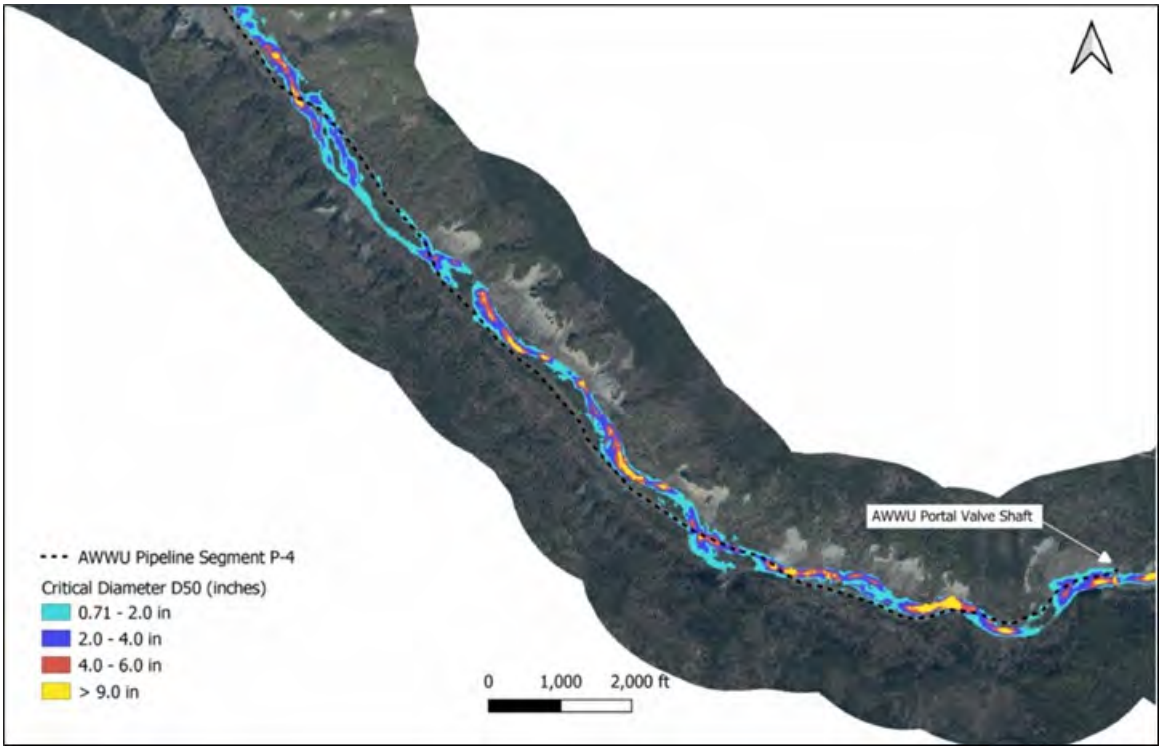

Figure 4.1-1. Grain Size Mobility along Upper Pipeline; 1% AEP Flood.

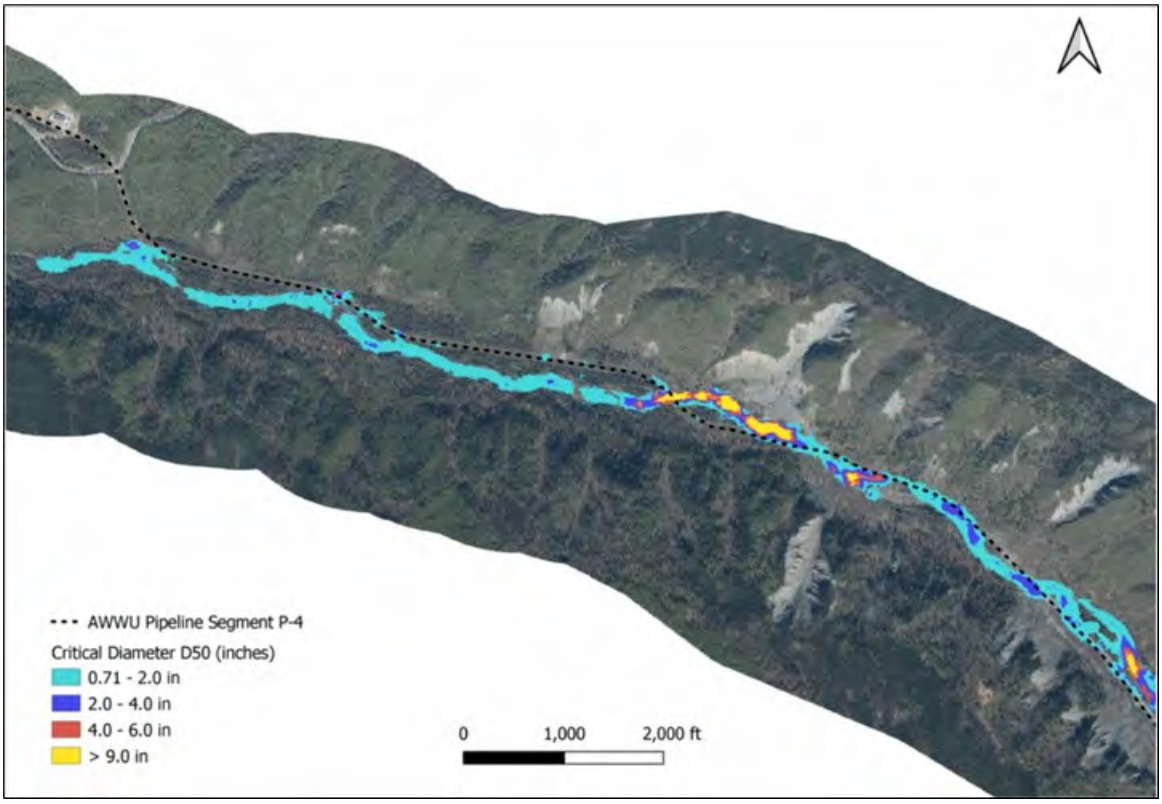

Figure 4.1-2. Sediment Grain Size Mobility along Lower Pipeline; 1% AEP Flood.

Approximately 4.2 miles of the 6.1-mile-long pipeline are inundated by the 1% AEP flood, representing approximately 70% of the total length. Approximately 2.1 miles of the pipeline experiences transport of grains larger than the median grain size of the pipeline zone material. The maximum grain size expected to be mobilized above the pipeline alignment exceeds a diameter of 1-foot, indicating scour of the pipeline cover even in locations which were armored to protect the pipeline. The depths and velocities at each computational cell along the pipeline alignment were utilized to calculate the expected grain size that is mobilized along the length of the alignment, as presented in Figure 4.1-3.

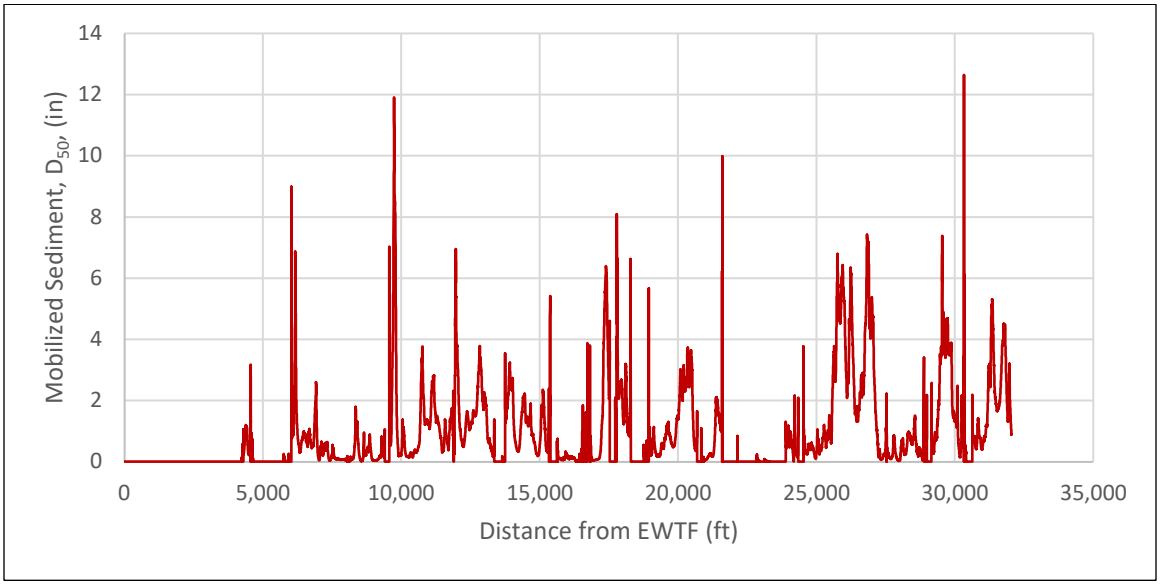

Figure 4.1-3. Mobilized Sediment along Pipeline Alignment – Sediment Size; 1% AEP Flood.

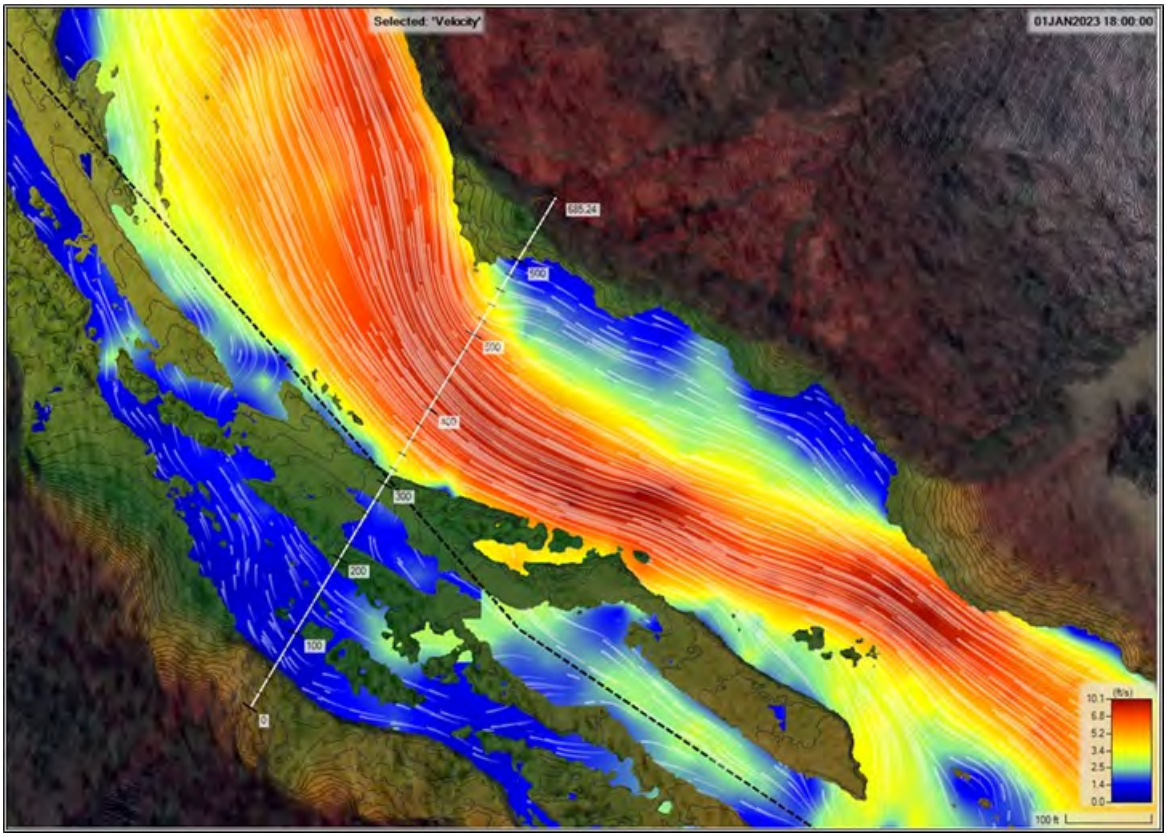
The sediment mobility analysis performed considers a fixed boundary condition within the model and has inherent uncertainties in the sediment transport capability, deposition potential, and does not consider the lateral migration of the channel under these hypothetical future flows. Channel migration cannot be directly modeled using HEC-RAS or other widely accepted models due to the stochastic nature of channel migration (accumulations of large woody debris can play a role in channel migration) and limitations of models to accurately calculate erosion of cohesive materials (e.g., riverbanks with tree and riparian vegetation roots). Within dynamic river systems such as the Eklutna River however, lateral channel migration is likely to occur. Figure 4.1-4 and Figure 4.1-5 show a plan and profile view of two example segments of the Eklutna River that have the potential to migrate laterally and expose the existing pipeline.



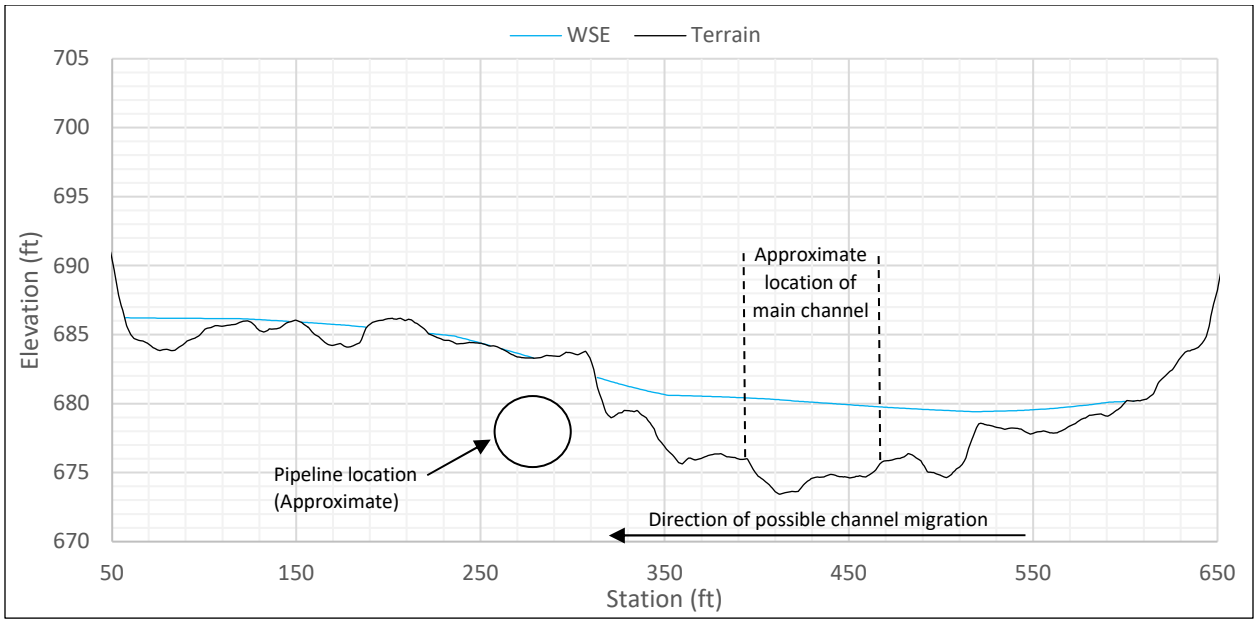


Figure 4.1-4. Plan (top) and Profile View (bottom) of 1% AEP Flood; STA 4252+00.

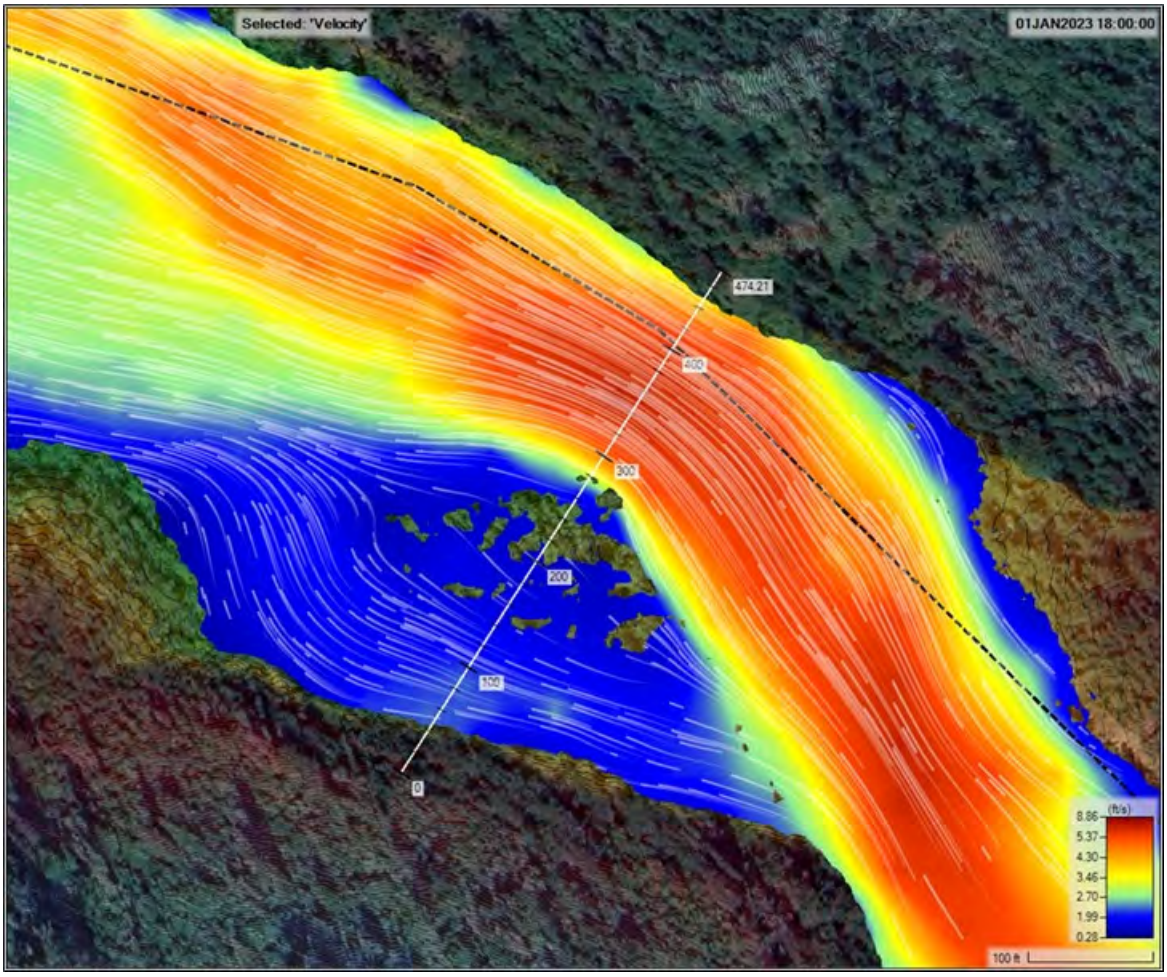

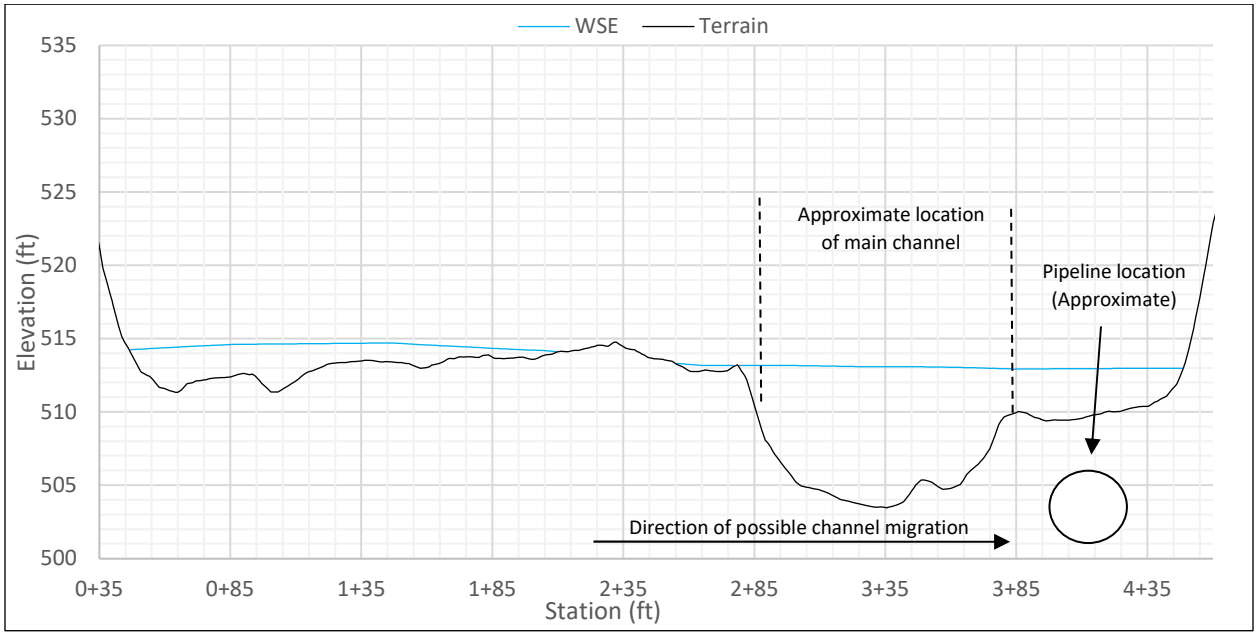

Figure 4.1-5. Plan (top) and Profile View (bottom) of 1% AEP Flood; STA 4136+00.

4.1.2.2 Road Inundation

The AWWU access and maintenance road runs alongside the pipeline adjacent to the Eklutna River for a length of approximately 6.5 miles. The road provides critical access to the pipeline for repairs and maintenance and must be accessible year-round for AWWU. The 1-D HEC-RAS model was run with a flow of 1,200 cfs representing the annual return interval flood within the Eklutna River. Due to the proximity and relatively low elevation of the access road, inundation occurs during the annual flooding conditions, as represented in Figure 4.1-6.

Figure 4.1-6. Access Road (white) and 1-Yr Flood Inundation Boundary (blue).

During the 1-Yr return interval flood, approximately 3,200 ft of the access road is inundated, representing approximately 10% of the road length. The total length of inundation is significantly increased under the larger return interval flooding events. In addition to losing the ability to utilize the access road due to the inundation extents, the road may be damaged by erosion or scour, preventing access by operators, or requiring repairs during the lower flow season. If the access road is to be utilized during future operations of the AWWU water supply infrastructure, mitigation measures would be necessary to allow year-round access to the pipeline.

4.1.2.3 Bridge Inundation

At the farthest upstream extents of the AWWU access and maintenance road exist two bridges spanning the Eklutna River. AWWU Bridge No.1 is the most upstream bridge located

at river mile (RM) 11.4, while AWWU Bridge No. 2 is located just downstream of the first bridge at RM 11.1. The bridge superstructures consist of timber decking supported by steel girders. The abutments and wingwalls consist of steel sheet piling keyed into each bank. Each bridge spans a length of 30 ft and has a height above the streambed of 5'-6" to 6'-0". A photograph of Bridge No. 1 is presented in Figure 4.1-7.

Figure 4.1-7. AWWU Bridge No. 1; Looking Upstream.

The design hydraulic capacity of each bridge is unknown. To estimate impacts to the bridge under the future hydrologic conditions of the river, the 1-D HEC-RAS model was utilized to consider the 1-Yr through 10-Yr return interval storm events. At a minimum the required freeboard to the low chord of the bridge shall be one foot to account for debris flow during the design flood. The profile of AWWU Bridge No. 1 as well as the maximum WSELs and freeboard are presented in Figure 4.1-8 and Table 4.1-1.

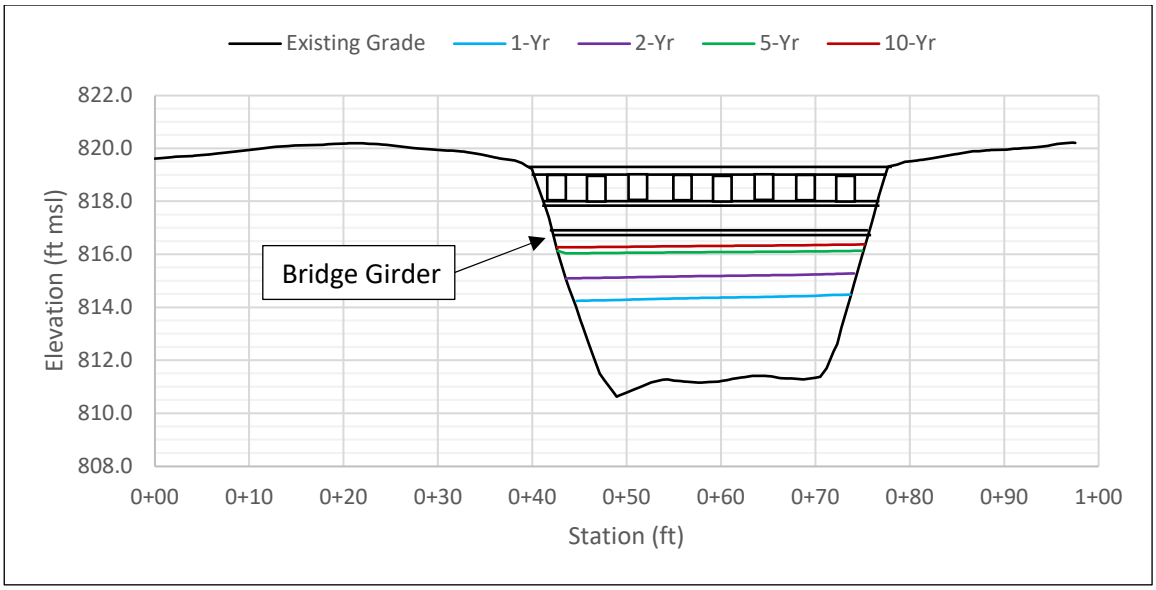

Figure 4.1-8. AWWU Bridge No.1 Profile; 1-Yr to 10-Yr Flood.

Table 4.1-1. AWWU Bridge No. 1; Flood Elevations.

AEP Flood (%)	Recurrence Interval	Flow Rate (cfs)	WSEL (ft msl)	Freeboard (ft)
100%	1-Yr	1,200	814.4	2.3
50%	2-Yr	2,360	815.2	1.5
20%	5-Yr	3,400	816.1	0.6
10%	10-Yr	4,150	816.3	0.4

The analysis indicates that AWWU Bridge No.1 likely has adequate freeboard under the 1-Yr and 2-Yr recurrence interval floods. The 5-Yr recurrence interval flood has less than 1 ft of freeboard which places the bridge at risk of damage due to debris loading or other unaccounted factors such as superelevation, hydraulic jumps, or other flow irregularities. It should be noted that this analysis does not account for potential scour of the banks or abutments and is focused primarily on hydraulic capacity. The same analysis was performed on the downstream AWWU Bridge No. 2. The profile of this bridge as well as the maximum WSELs and freeboard are presented in Figure 4.1-9 and Table 4.1-2.

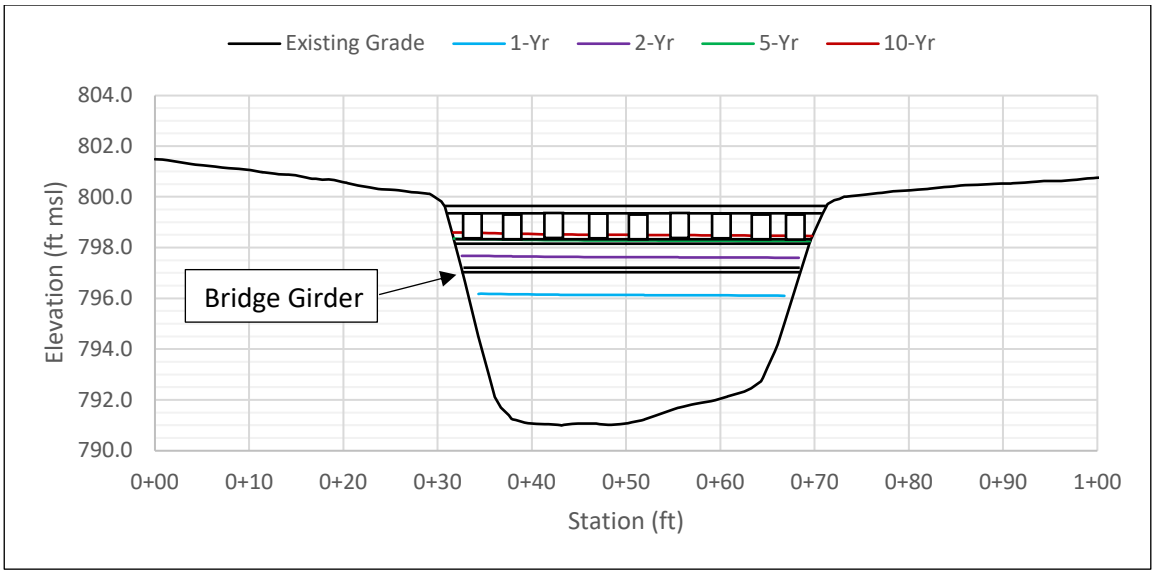

Figure 4.1-9. AWWU Bridge No.2 Profile; 1-Yr to 10-Yr Flood.

Table 4.1-2. AWWU Bridge No. 2; Flood Elevations.

AEP Flood (%)	Recurrence Interval	Flow Rate (cfs)	WSEL (ft msl)	Freeboard (ft)
100%	1-Yr	1,200	796.1	0.9
50%	2-Yr	2,360	797.6	-0.6
20%	5-Yr	3,400	798.3	-1.3
10%	10-Yr	4,150	798.5	-1.5

The analysis indicates that AWWU Bridge No.2 has inadequate freeboard under the 1-Yr recurrence interval flood and would likely be overtopped at flows equal to or exceeding the 2-Yr flood of 2,360 cfs. The bridge is at risk of damage and is inadequate to pass flows under the proposed unregulated Eklutna River hydrograph.

4.1.2.4 Water Curtailment

The EWTF treats all water from Eklutna Lake prior to being discharged through AWWU's water distribution network. The facility at its current capacity is sized to treat a maximum of 32 Million Gallons per Day (MGD), corresponding to an average daily flow of 49.5 cfs; however, AWWU's water permit allows water withdrawals up to a maximum of 41 MGD (63.4 cfs) for public water supply purposes[12]. The flow rate through the facility typically varies from 19-26

[12] State of Alaska Department of Natural Resources Division of Land and Water Management. Permit to Appropriate Water, LAS 2569. (December 16, 1985)
https://eklutnahydro.com/wp-content/uploads/2020/03/ADNR-1985-Permit-to-Appropriate-Water-LAS-2569.pdf

MGD (30-40 cfs). The average monthly flow through the EWTF from 2011-2021 is presented in Figure 4.1-10.

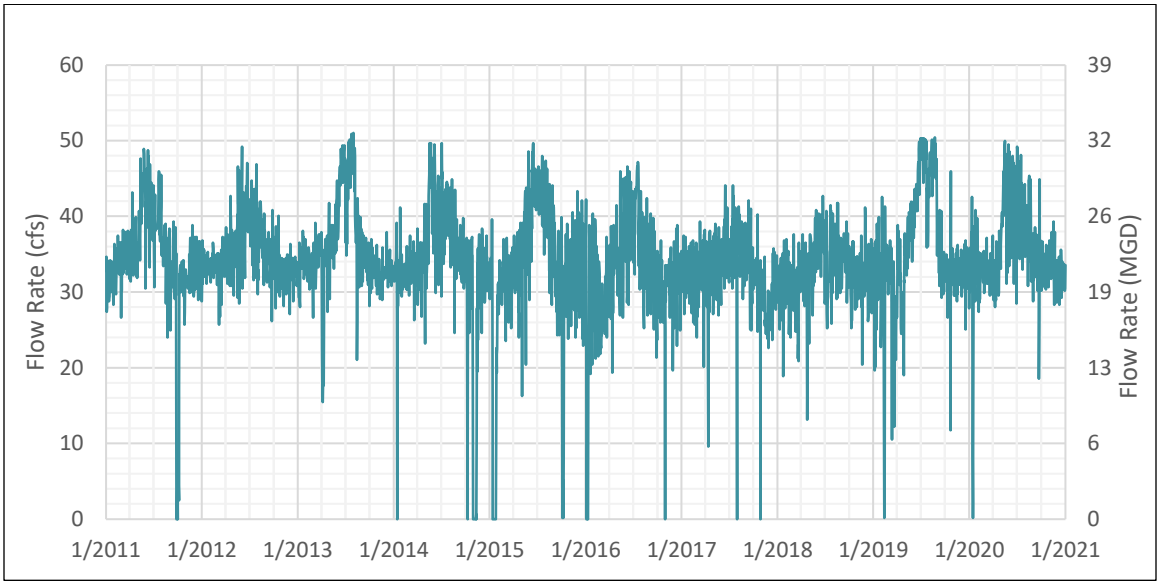

Figure 4.1-10. EWTF Flow Rate; 2011-2021.

The dam removal operations model was updated to calculate reservoir fluctuation and instream flows over the 2011 – 2021 period of record without the powerhouse operational but with AWWU water diversions included. The analysis indicates that over the 10-year period of operation which was analyzed, the withdrawals for water supply would cause the Eklutna River to run dry on three separate occasions. The Eklutna River flow rate following historical water supply withdrawals from Eklutna Lake is presented in Figure 4.1-11.

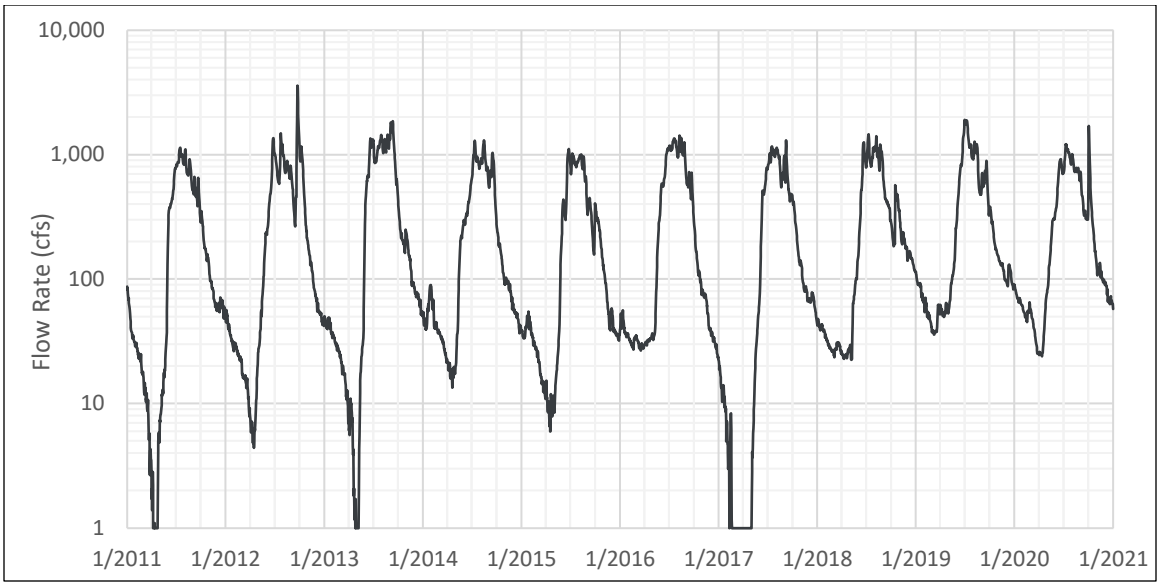

Figure 4.1-11. Eklutna River Flow Rate w/ EWTF Historical Withdrawals; 2011-2021.

The results from the operations model indicate that AWWU water withdrawals from Eklutna Lake would cause the reservoir to be drawn below the crest of the existing lake outlet and the river would run dry during a 17-day span in 2011, an 11-day span in 2013, and a 73-day span in 2017. The results of this analysis suggest that while the water supply project without Eklutna Dam is feasible, it may require curtailing the water supply during certain years to maintain an instream flow or risk dewatering of the river.

A secondary model run was performed to assess instream flows over the 2011 – 2021 period of record with the maximum EWTF water diversion included, corresponding to their water right of 41 MGD. The analysis indicates that over the 10-year period of operation, the withdrawals for water supply would cause the Eklutna River to run dry in the majority of years, with the exception of unusually warm or wet winters. The Eklutna River flow rate following the maximum water supply withdrawal from Eklutna Lake is presented in Figure 4.1-12.

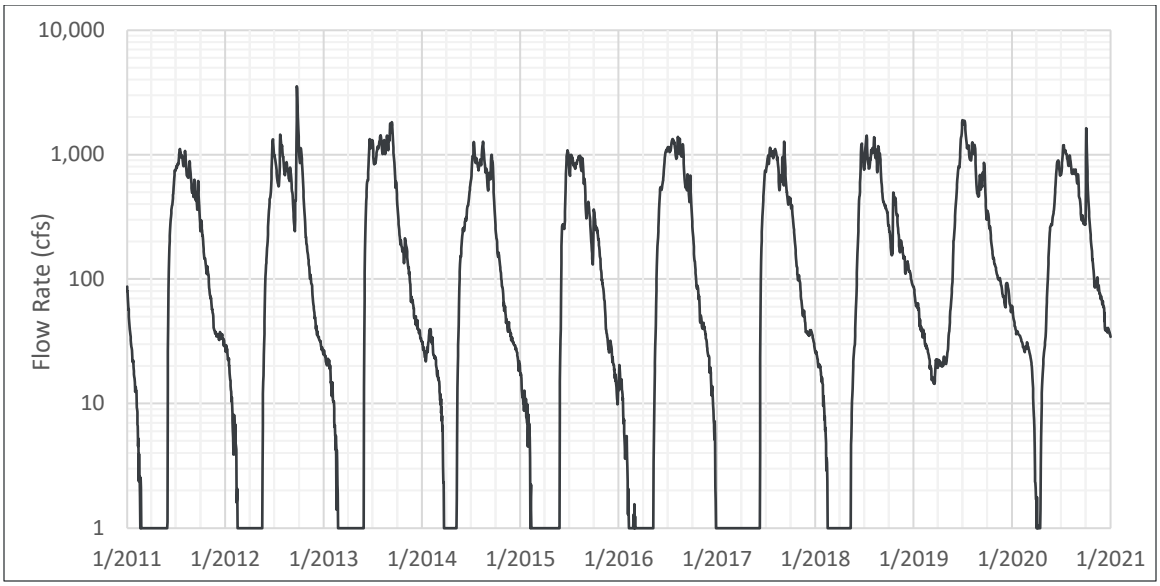

Figure 4.1-12. Eklutna River Flow Rate w/ EWTF Max Withdrawals; 2011-2021.

The operations model indicates that the maximum AWWU withdrawals from Eklutna Lake would cause the reservoir to be drawn below the crest of the existing lake outlet and the river would run dry for two to three months each winter with the exception of the 2019 water year. The results of this analysis suggest that dam removal would prevent the Eklutna Water Project from being able to withdraw their maximum water right (up to 41 MGD) year-round in this hypothetical future operating regime.

4.1.2.5 Risk Assessment

The analysis of the AWWU water supply infrastructure in a dam removal scenario indicates that the buried pipeline Segment P-4 has an increased scour potential under future flow scenarios which may lead to exposure and instability of the pipeline. Depending on the depth and nature of the scour or the extent of channel migration, the exposed pipeline would lose bedding material leading to sagging or potential rupture. Additionally, debris impact may cause failure of the pipeline wall, leading to further damage or potential loss of the water supply. This results in an unacceptable risk to a critical resource and necessitates some form of mitigation to protect the municipal water supply in a post-dam removal scenario, as outlined in Section 4.1.3.

The access and maintenance road along the river channel is inundated under annual peak flows within this scenario, making the pipeline inaccessible under all future flooding events and both bridges exceed their hydraulic capacity and may experience damage and/or failure. This likely would inhibit AWWU from inspecting or repairing the pipeline when water levels are high, which may result in a loss of operation for extended durations. Should the access and

maintenance road be utilized for future maintenance of the pipeline, mitigation measures are needed to maintain year-round access.

The operations model performed on the reservoir under the proposed dam removal scenario indicates that there may not be sufficient inflows to the reservoir for AWWU to provide their historical water withdrawals year-round with the dam removed. The analysis further shows that the reservoir is unable to provide the maximum water right granted to AWWU (41 MGD) year-round without the reservoir impoundment in place. This may result in either the river running dry for extended periods of time, or AWWU needing to curtail withdrawals and supply water from other sources during portions of the year.

4.1.3 Mitigation Strategies

Various strategies exist to mitigate the risks associated with dam removal to the current AWWU infrastructure. The strategies considered as part of this evaluation are as follows:

1. Armor the existing pipeline and reconstruct the AWWU maintenance road and bridges to withstand future flooding events;
2. Construct a new pipeline to withdraw water from Eklutna Lake outside of the extents of the Eklutna River;
3. Construct a new water supply project to collect water from an alternative watershed;
4. Increase the system capacity of other existing water supply projects within AWWU's service area.

The following subsections describe in a high level of detail the possible actions under each of these potential mitigation strategies.

4.1.3.1 Armor the Existing Pipeline

The analysis described in Section 4.1.2.1 details that the pipeline is at risk of exposure due to bed scour or channel migration under future flooding events. The analysis assumes that the pipeline bedding, zone material, and backfill consist of a median material size of 18 mm (0.71 in) as estimated from the Year 2 Geomorphology Study report as well as information obtained from the Pipeline as-built drawings and specifications. A potential mitigation strategy to protect the pipeline from future scouring and erosion as a result of channel migration is to excavate the material around the pipeline and provide a protective armor rock layer along the length of the pipeline located within the Eklutna River valley. The pipeline armament would consist of armor rock, or riprap, with a material gradation roughly equivalent to the requirements presented in Table 4.1-3. It should be noted that the initial results of the

sediment mobilization study performed indicate mobilization of grain sizes exceeding 12-inches at key areas along the pipeline. These locations may require further armament or protection than the proposed armor rock gradation described below.

Table 4.1-3. Armor Rock Gradation.

Size (in.)	% Passing by Weight
24	100%
12	10% – 50%
6	0% – 20%

For pipeline access, the existing access road would need to be reconstructed to a height above the 1% AEP flood for the Eklutna River. This would require a significant amount of new material to be brought into the access road as well as slope protection on the embankments to prevent erosion under flooding conditions. In locations where the river is more confined, the access road may be unable to be co-located adjacent to the river and may require additional bridges or culverts. Each of the known access road crossings (10 total) would require a bridge to be constructed meeting the hydraulic design criteria of the 1% AEP flood.

While this mitigation strategy may protect the pipeline from scouring under future flooding conditions and allow access to AWWU personnel under most flow conditions, the pipeline likely would be unable to be maintained, repaired, or replaced under a high flow condition due to its current alignment co-located with the river channel. This risk is unable to be mitigated fully under this strategy without re-aligning the pipeline and is not considered the preferred mitigation strategy as part of this assessment.

4.1.3.2 Construct a New Pipeline

To address the risks associated with pipeline access for maintenance and repair under the evaluated future hydrologic conditions, an alternative mitigation strategy is to construct a new pipeline to withdraw water from Eklutna Lake. During the original alternatives analysis of water supply opportunities for AWWU in 1981, the MOA investigated alternative pipeline alignments to extract water from the Eklutna watershed[13]. This study investigated the following routes for the proposed Eklutna Water Project pipeline:

- Alternative 1: Tailrace and River Diversion
    - This alternative would draw water from the power plant tailrace and from the Eklutna River at a point near the Old Glenn Highway bridge. A diversion

[13] Municipality of Anchorage. Eagle River Water Resource Study Executive Summary. (December 1981).

structure would be placed on the Eklutna River to supply a large percentage of summer demand. During periods where the Eklutna River is insufficient to meet demand, water would be pumped from the Eklutna Power Plant tailrace.

- Alternative 2: Tunnel Diversion
    - In this alternative, water would be taken by tapping the existing pressurized power plant tunnel at the adit near the surge tank, located immediately above the power plant.
- Alternative 3: Eklutna Lake and River Diversion
    - This alternative would take water directly from the Eklutna River by releasing flow from Eklutna Lake. A diversion structure would be located on the river near the Old Glenn Highway providing water to the EWTF.

The alternatives investigated as part of the original planning of the Eklutna Water Project may provide some guidance on potential methods for utilizing Eklutna Lake as the primary water supply alternative for AWWU. Of the alternatives originally investigated, any diversion structure or impoundment located on the Eklutna River would not be considered a viable alternative as part of this assessment due to the desire to maintain a continuous hydraulic connection from Eklutna Lake to the mouth of the river on Knik Arm. The alternative to pump water from the Eklutna Power Plant tailrace has its advantages; however, the tailrace would not be supplied flow under the proposed dam removal scenario where flow to the power plant is terminated. While the specific alternatives proposed in the original alternatives analysis may not be feasible under the dam removal scenario, a combination of these alternatives may have merit.

A solution that may be technically feasible is to tap into the existing penstock and construct a new pipeline running from the Eklutna Power Plant to the EWTF. The proposed route results in a new buried pipeline running a length of approximately 9.6 miles from the existing Eklutna Power Plant to the inlet of the EWTF, as presented in Figure 4.1-13. The alignment considered as part of this investigation runs from the power plant along the path of the Old Glenn Highway to the junction with the New Glenn Highway (AK-1). The pipeline follows the highway for approximately 3.5 miles to the junction of the Eklutna Lake Road offramp. The pipeline then follows Eklutna Lake Road a short distance to the EWTF. Note that this alignment does not consider property rights, environmental considerations, or the co-location of any other utilities along the route and is intended to be a conceptual layout for the hypothetical AWWU pipeline re-alignment.

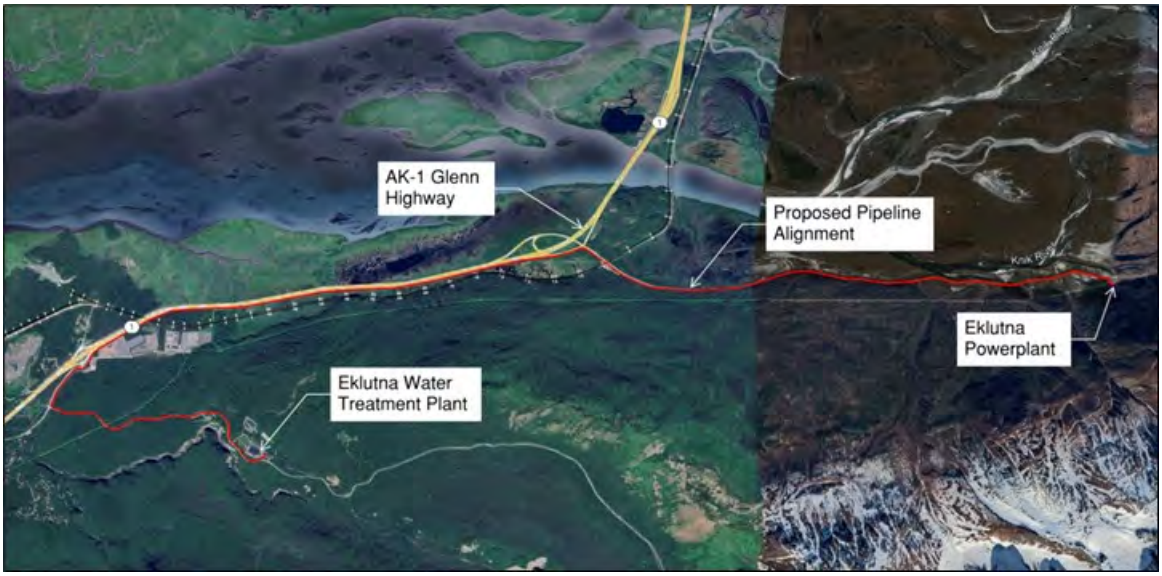

Figure 4.1-13. Conceptual Alignment of Proposed Pipeline Re-Route.

The pipeline would be approximately 54" diameter and rated to withstand the maximum hydraulic pressures expected along the new alignment. The hydraulic gradeline (HGL) of the proposed route was determined by modifying the hydropower operations model developed as part of the study program. The HGL is presented in Figure 4.1-14 and the minimum and maximum steady state pressure on the EWTF under a flow of 41 MGD (63.4 cfs) is presented in Table 4.1-4.

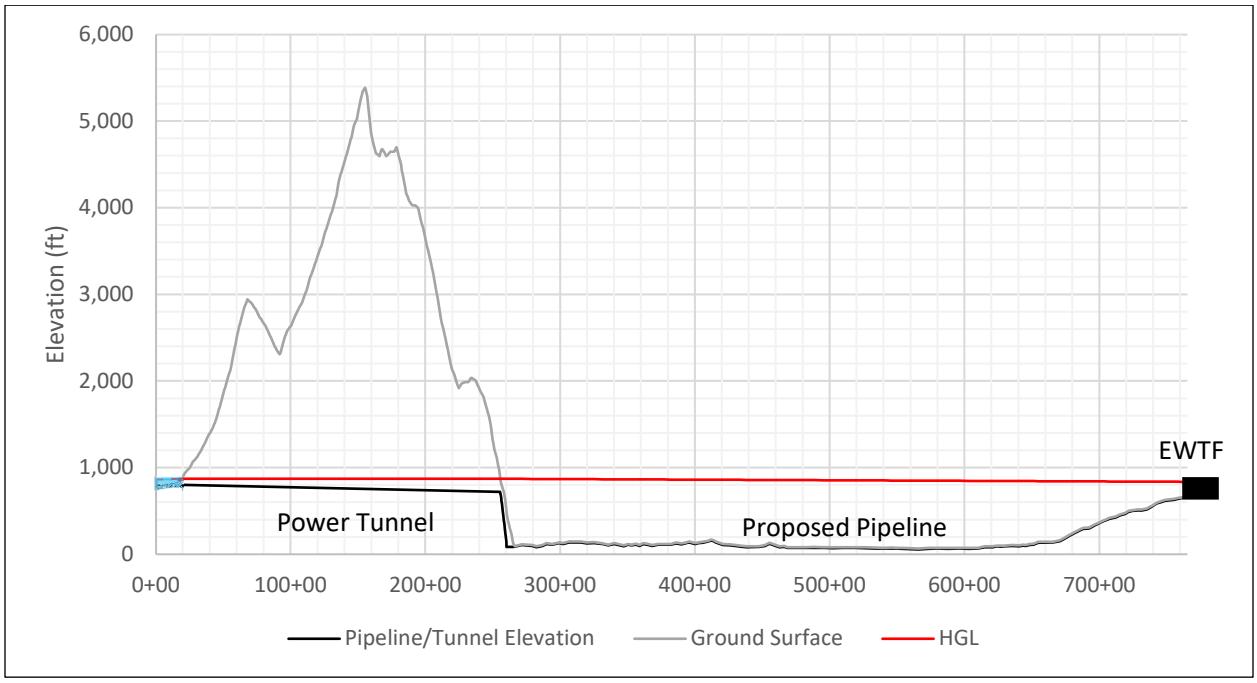

Figure 4.1-14. Hydraulic Gradeline; Proposed Pipeline Alignment at 41 MGD.

Table 4.1-4. Pressure at EWTF; Proposed Pipeline Alignment.

Eklutna Lake WSEL (ft Local Datum)	Flow Rate	EWTF Pressure (PSI)
861.0	0 MGD	92.2
	22 MGD / 34.0 cfs	87.4
	41 MGD / 63.4 cfs	77.1

From a hydraulic perspective, this hypothetical alignment maintains sufficient driving head to convey water from the power plant to the EWTF at the minimum lake level of 861.0 ft. The additional head losses caused by friction due to the increased pipeline length are negligible considering the additional head gained by the lake maintaining a steady elevation of El 861.0 to El 865.0 ft.

The primary risk with this alternative is that curtailment of water withdrawals may be necessary to prevent the river from running dry under the proposed dam removal scenario. Given AWWU's preferential water rights for municipal water supply from this watershed, continuous instream flows, particularly in winter months, may be at risk unless water is sourced from an alternative location. This risk may be avoided if an alternative watershed is selected for future water supply needs.

4.1.3.3 Construct a New Water Supply Project

Evaluating the development of a new watershed for supplying the future water needs for the MOA under a dam removal scenario is a complex process which is beyond the scope and timeline of this risk assessment memorandum. For the purposes of this investigation, we considered the alternative developments proposed as part of the Water Resources Study published in 1981 prior to the development of the Eklutna Water Project. While the study did evaluate alternative pipeline alignments for withdrawing water from the Eklutna watershed as described in the previous subsection, the original intent of the study was to evaluate the potential for utilizing Eagle River as a potential water source. The two alternatives evaluated for utilizing Eagle River as a water source included the development of a well field and groundwater source within the Eagle River valley or the construction of a new reservoir on Eagle River.

As part of the 1981 investigation, eight wells were drilled within the Eagle River watershed in search of an aquifer capable of supplying water to the MOA. This investigation established that the Eagle River Valley consists primarily of silts and clays and does not contain an aquifer capable of meeting water demand for the municipality.

The preferred solution for development of Eagle River as a water supply source was to site a new dam located approximately 1.5 miles east of the New Glenn Highway Bridges over Eagle River. This dam would impound a reservoir capable of meeting a constant diversion of 47 MGD, which would be sufficient for replacing Eklutna Lake as a water supply source. The Eagle River reservoir alternative was eventually not pursued further by the MOA due to serious potential cost, schedule, and operational problems associated with the proposed facility. At this time, pending further analysis of the regional watershed water supply characteristics, the construction of a new water supply project is not weighed heavily as a potential mitigation strategy as part of the current assessment.

4.1.3.4 Increase Capacity of Existing Water Supply Projects

The existing water supply projects serving the MOA are the EWTF, the Ship Creek Water Treatment Facility (SCWTF), and groundwater wells located throughout the municipality. The SCWTF has a treatment capacity of 16 MGD with a water right of 24 MGD but is seasonally limited to 10 MGD of capacity. The groundwater wells vary but are expected to provide a combined total water supply of up to 20.2 MGD[14]; however, 10 MGD of well production is currently inactive while new EPA regulations are being assessed. Investigations have been performed to establish new wells within the MOA to provide added resiliency to the water supply system. These additional well fields would be located east of the SCWTF and are expected to have a capacity of 2 – 4 MGD.

While upgrades to the existing SCWTF and the addition of new well fields may yield additional water for the MOA, the additional gains would not make up for the loss of the EWTF's 32 MGD treatment capacity. Pending further information from the MOA on the ability to increase the output of the SCWTF or the discovery of new aquifers within the region, increasing the capacity of the existing water supply projects does not appear to be a preferred strategy for replacing the Eklutna Water Project as a primary source for water supply.

4.2 Old Glenn Highway Bridge

4.2.1 General

The Old Glenn Highway Bridge was replaced in 2015 and consists of a 254-foot long, two-span concrete bulb-tee girder bridge with three center piers located in the floodplain of the Eklutna River. Due to the topography of the canyon at this location, both bridge abutments are well above the influence of the river, even at extreme flood stages. Photographs of the bridge

[14] Municipality of Anchorage. 2012 Anchorage Water Master Plan. (December 2012).

and pier are provided in Figure 4.2-1 and design details of the bridge pier are provided in Figure 4.2-2.

Figure 4.2-1. Old Glenn Highway Bridge U/S View (Left); Bridge Pier (Right).

The center pier consists of three 4-foot diameter concrete columns with permanent steel casings, located approximately 125 ft from the left abutment. The piers enter the ground surface at El. 87.5 ft and pass through approximately 43 ft of soil before entering bedrock at El 44.0 ft. Each pier is drilled and anchored into approximately 6 ft of bedrock. The design of each pier is presented in Figure 4.2-2.

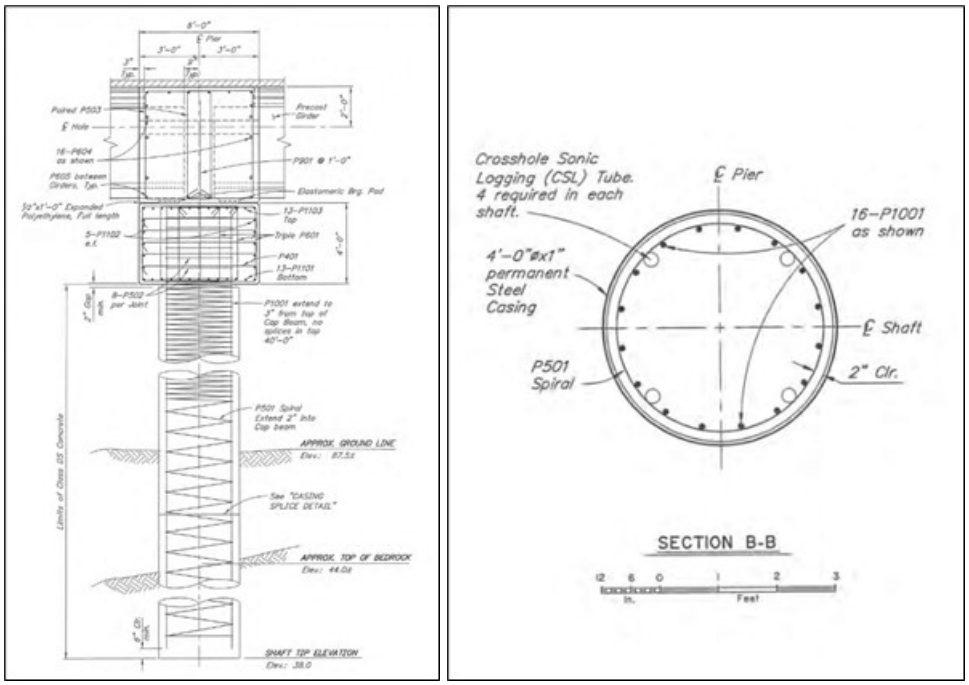

Figure 4.2-2. Old Glenn Highway Bridge Pier Profile (Left); Bridge Pier Section (Right).

4.2.2 Hydraulic Capacity

The existing structure spans a confined stretch of the Eklutna River at a height well above the canyon floor. To determine whether the bridge has sufficient hydraulic capacity under a future dam removal scenario, the 1% AEP flood corresponding to the reach below Thunderbird Creek was analyzed, equating to a total flow of 7,460 cfs as defined in Section 2.0. The low chord of the bridge is located a maximum of 40 ft above the natural river channel and passes the 1% AEP flood with a freeboard of approximately 27 ft. The confined reach of the canyon has a relatively stable cross section both upstream and downstream of the bridge, which reduces the risk of contraction scour on either abutment caused by flooding. However, the center piers located at approximately the midspan of the bridge would experience pier scour during flooding conditions. The flow velocities of the channel beneath the bridge during the 1% AEP flood are presented in Figure 4.2-3 and Figure 4.2-4.

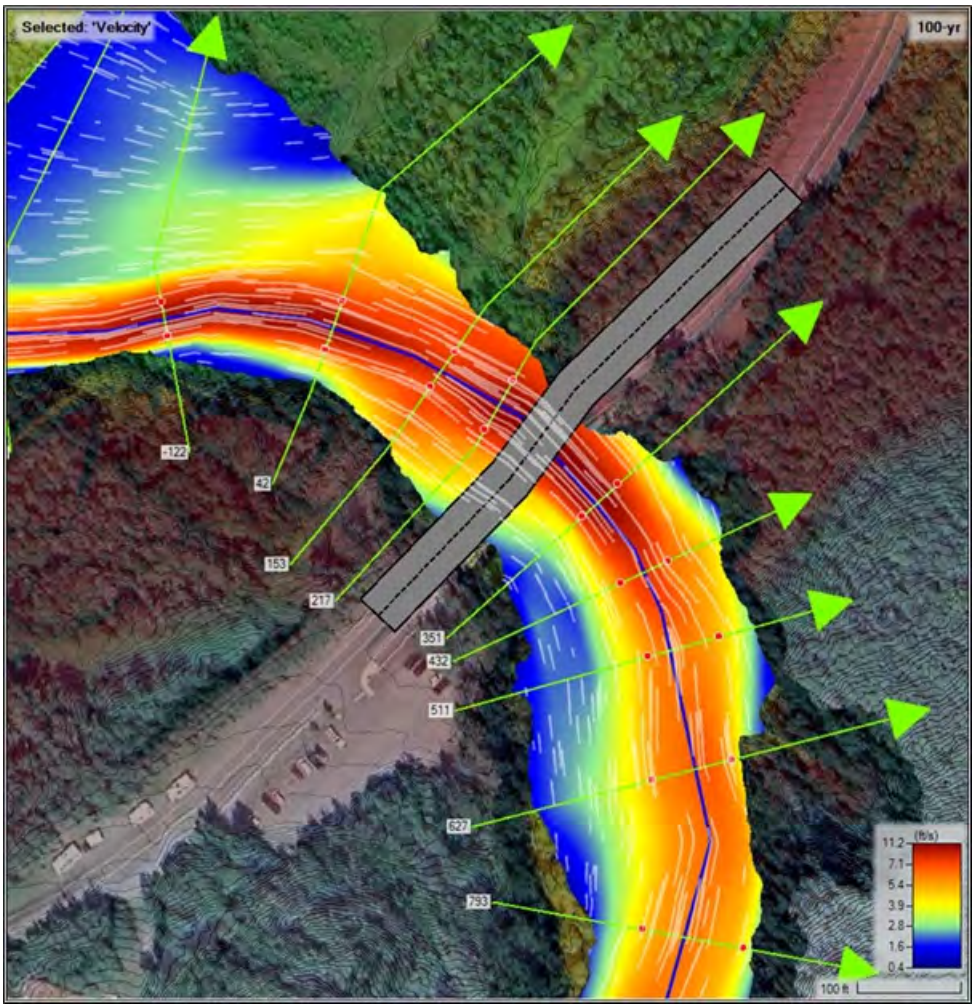

Figure 4.2-3. Maximum Water Velocity Plan View; 1% AEP Flood.

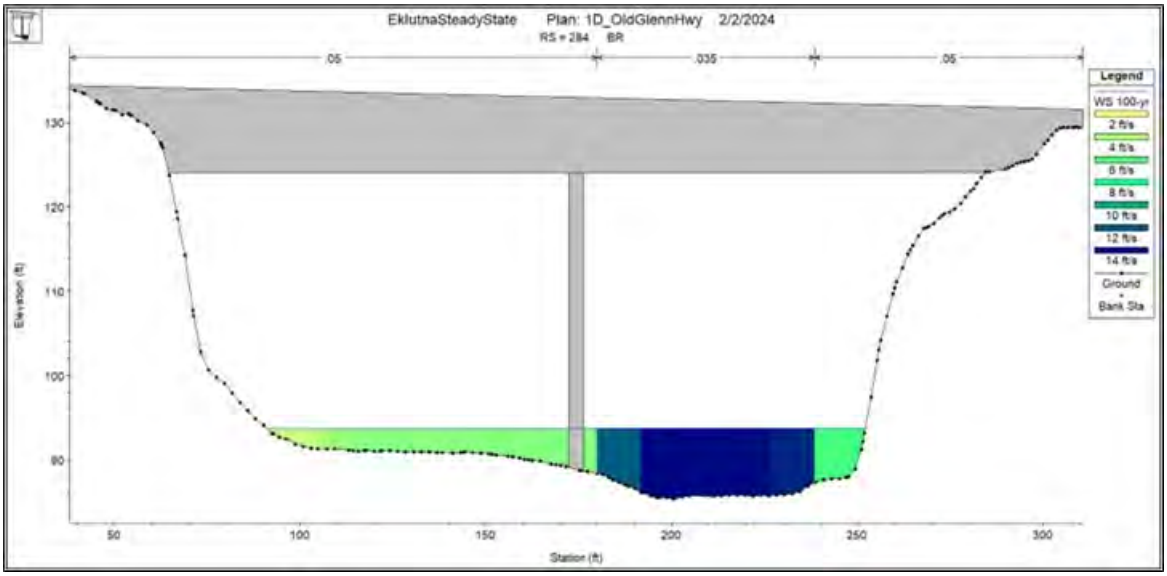

Figure 4.2-4. Water Velocity Upstream Profile; 1% AEP Flood.

4.2.3 Pier Scour

A 1-D HEC-RAS Model was developed to better represent the hydraulics at the Old Glenn Highway Bridge and to gain an understanding of the impacts of the existing bridge pier on flood flows within the Eklutna River channel. The hydraulic characteristics of the 1-D model were calibrated to the characteristics of the 2-D HEC-RAS model previously developed for the Eklutna River channel. The water surface elevations for the 1-D and 2-D modeling approaches are presented in Figure 4.2-5 and indicate general concurrence on the hydraulic profile.

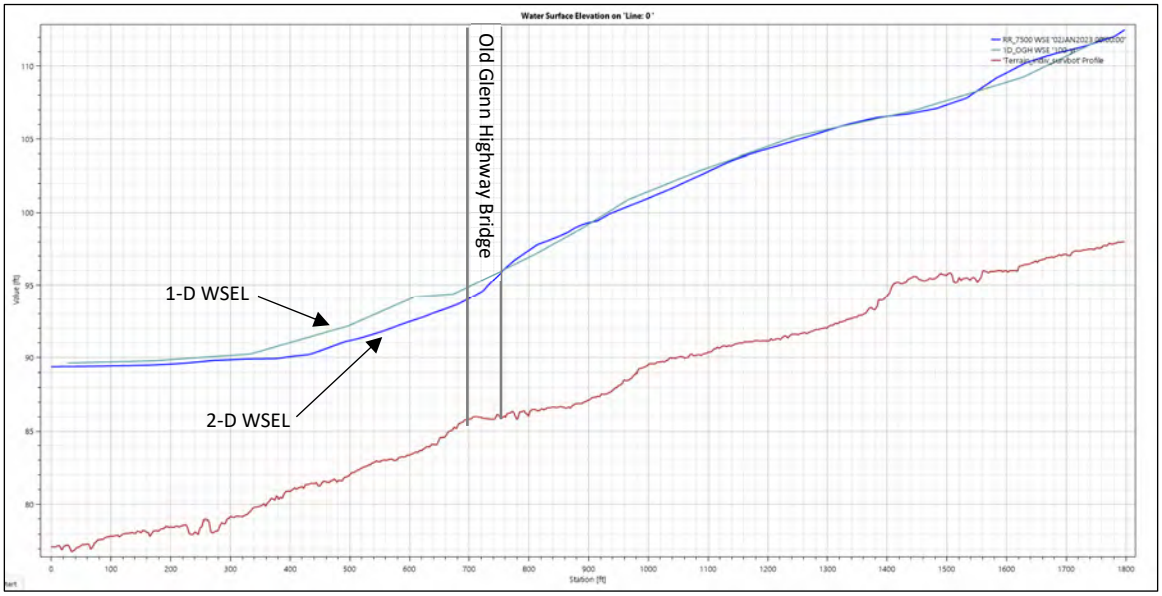

Figure 4.2-5. 1-D and 2-D WSE Profile through Old Glenn Highway Bridge.

The 1% AEP flood flow rate of 7,460 cfs was run through the HEC-RAS model to assess scour at the existing pier. Contraction and pier scour equations for non-cohesive stream bed material were utilized to estimate the depth of scour in accordance with the guidance of HEC-18[15]. The sediment gradation used within the model was based on the information presented in the Year 2 Geomorphology and Sediment Transport Study, which defined a D_{50} of 23-mm from Transect G, located approximately 750 ft downstream of the Old Glenn Highway bridge.

Two sediment transport conditions were calculated to understand the scour risks to the pier located within the Eklutna River floodplain. The live bed scour occurs when the river is actively transporting sediment and both eroding and depositing material simultaneously at a given transect. Clear water scour occurs when there is effectively zero sediment transport upstream of the bridge crossing and the energy of the river is focused on erosion of the bed material. The velocities upstream of the bridge crossing indicate that the sediment transport condition affecting the bridge pier are expected to be the clear water scour condition. Table 4.2-1 summarizes the scour depths calculated from the modeling at the location of the bridge pier.

Table 4.2-1. Scour Depths; Old Glenn Highway Bridge Pier.

Description	Scour Depth (ft)
Clear Water Scour Depth	3.3
Pier Scour Depth	6.1
Total Scour Depth	9.4

4.2.4 Mitigation Strategies

The Old Glenn Highway Bridge has sufficient freeboard to pass the 1% AEP flood without risk of inundation or overtopping of the bridge deck. The existing piers are within the floodplain of the river and appear to be designed against debris impact with 1" steel casing protecting the reinforced concrete columns. The scour analysis presented in the previous section indicates approximately 9-10 ft of total scour at each pier, which does not appear to pose any immediate risks to the structure due to the depth of the drilled pier into soil and bedrock; however, additional confirmation is necessary to conclude that the pier design is sufficient under this proposed new loading condition. At this time, no additional mitigation would be anticipated for the Old Glenn Highway Bridge under the proposed hydrologic conditions of the Eklutna River post-dam removal.

[15] United States Department of Transportation Federal Highway Administration. Evaluating Scour at Bridges, 5th Ed. Hydraulic Engineering Circular No. 18.

4.3 New Glenn Highway Bridges

4.3.1 General

The New Glenn Highway Bridges were constructed in 1975 and consist of a northbound and southbound span of the New Glenn Highway over the Eklutna River. Both spans are prestressed concrete bulb-tee girder bridges and run a length of approximately 100 ft at a maximum height of 18 ft over the streambed. The design highwater elevation for this bridge is El. 82.0 ft. Photographs of the bridge and abutments are provided in Figure 4.3-1.

Figure 4.3-1. New Glenn Highway Bridges D/S View (Left); Right Abutment (Right).

The bridges have a relatively short height when compared to the Old Glenn Highway Bridge with a distance from the low chord of the bridge to the river channel of approximately 16 ft. Beneath the bridges, riprap spans from the river channel to a berm protecting each abutment from erosion, and spans to a height of approximately 14 ft above the riverbed. The elevation view of the bridges looking downstream is provided in Figure 4.3-2.

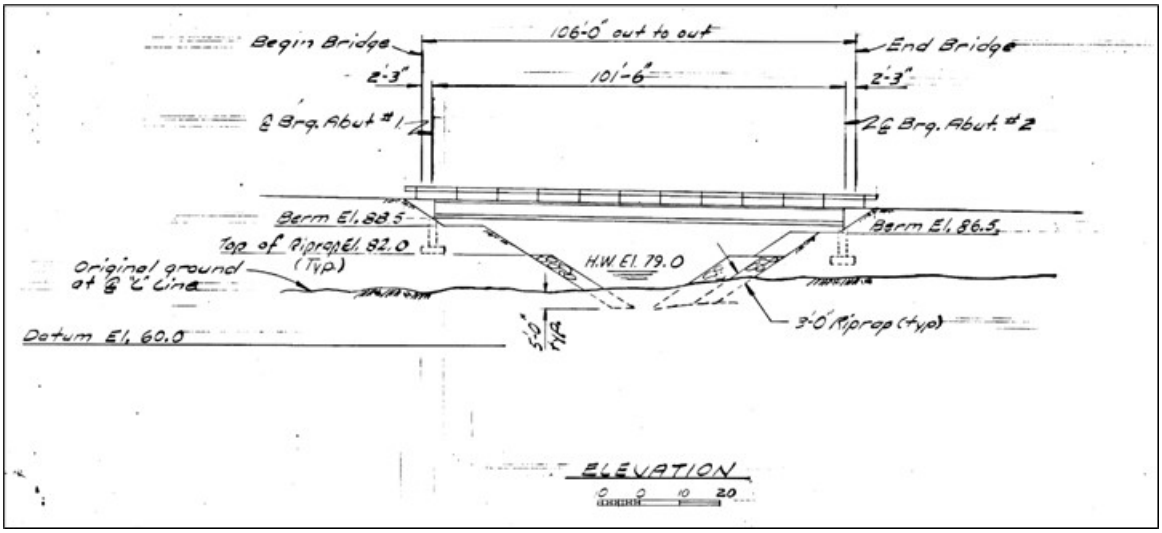

Figure 4.3-2. New Glenn Highway Bridge; Elevation View (MOA 72 Datum).

It shall be noted that a segment of AWWU's 54" diameter water supply pipeline P-3 as well as a 24" diameter segment of pipe which supplies water to the neighborhood around Thunderbird Falls pass beneath the riverbed in the immediate vicinity of the New Glenn Highway bridges. Each pipeline runs at a depth of approximately 10 ft to the crown of the pipe and are armored in reinforced concrete.

4.3.2 Hydraulic Capacity

A 2-D HEC-RAS model was used to represent the existing crossing of the New Glenn Highway Bridges over the Eklutna River. The 1% AEP flood was input into the model to determine impacts to the bridges, corresponding to a flow of 7,460 cfs. Discussions with the State of Alaska Department of Transportation and Public Facilities (DOT&PF) indicate that these bridges would require approximately 2 ft of freeboard plus an additional 1 foot to account for ice and debris, yielding a minimum freeboard requirement at the design flood of 3 ft. The profile of the bridges documenting the maximum water surface elevation of the 1% AEP flood is provided in Figure 4.3-3. The minimum freeboard calculated under this flood scenario is 1.8 ft.

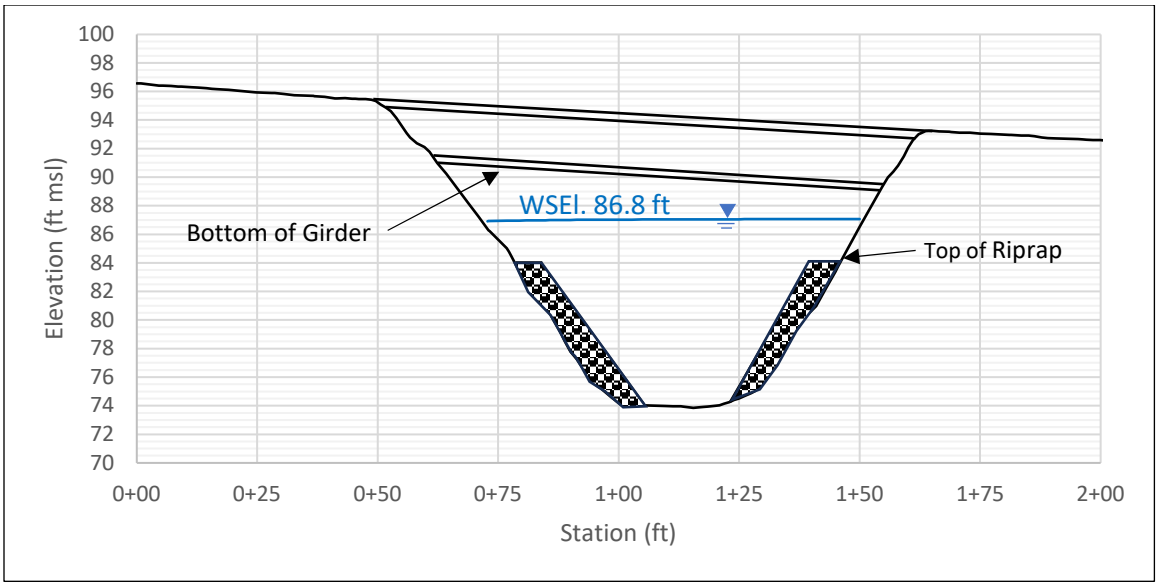

Figure 4.3-3. New Glenn Highway Bridge Profile; 1% AEP Flood (MOA72 Datum).

The reach between the New Glenn Highway and Old Glenn Highway bridges is relatively unconfined, which allows for a backwater effect to form at the location of the New Glenn Highway Bridges. This creates a significant contraction in the flow at the location of the bridges, exacerbating the potential for contraction and abutment scour. Additionally, the design of the current bridges utilizes shallow spread footings located high on either abutment, which is susceptible to damage or failure caused by scour under high flow events.

4.3.3 Mitigation Strategies

Based on the preliminary hydraulic analysis performed, the current New Glenn Highway bridges are not sufficient to pass the flood flows incurred under the proposed dam removal scenario. The bridges would need to be replaced with a bridge of larger span to increase freeboard and lessen the hydraulic contraction currently in place.

An alternative 2-D HEC-RAS model was produced that increased the span of the New Glenn Highway Bridges from 100 ft to 250 ft. This alternative reduced velocities through the bridge span substantially as well as reduced the freeboard under the 1% AEP flow. Although contraction of the channel at the location of the bridges still occurs, the increased span length reduces the upstream backwater effect and provides approximately five additional feet of freeboard. Figure 4.3-4 presents the water velocities through the bridge span and Figure 4.3-5 presents a longitudinal profile of the water surface elevations through the bridge span pre- and post-bridge replacement.

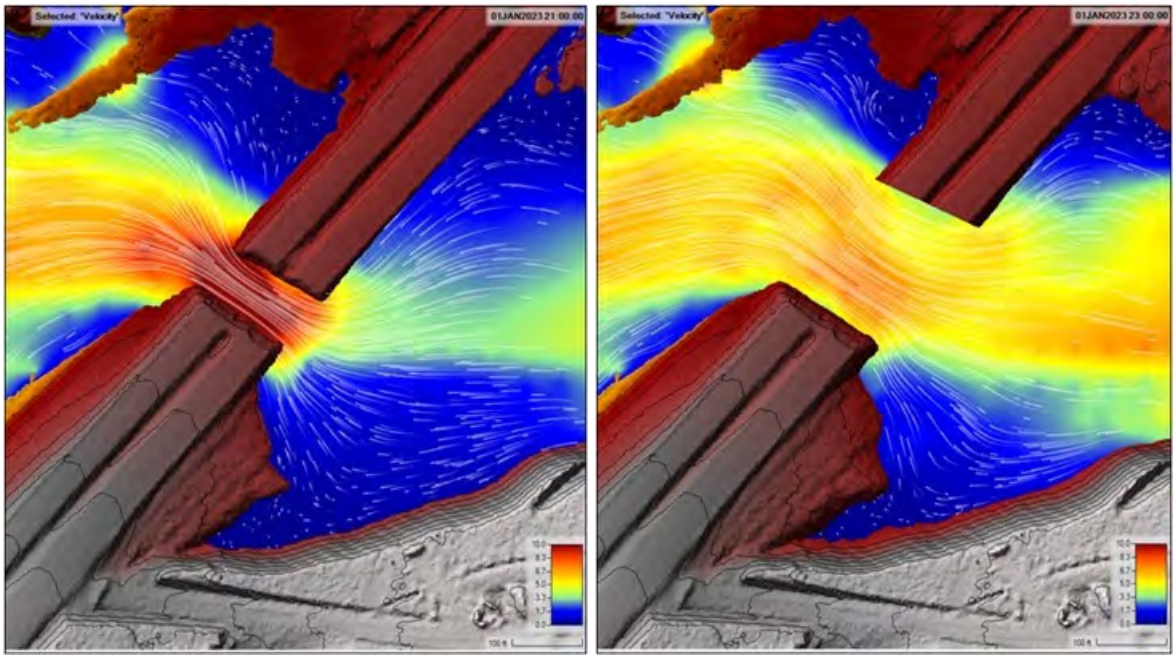

Figure 4.3-4. Plan view of velocities at the New Glenn Highway Bridges pre- and post-Bridge Replacement.

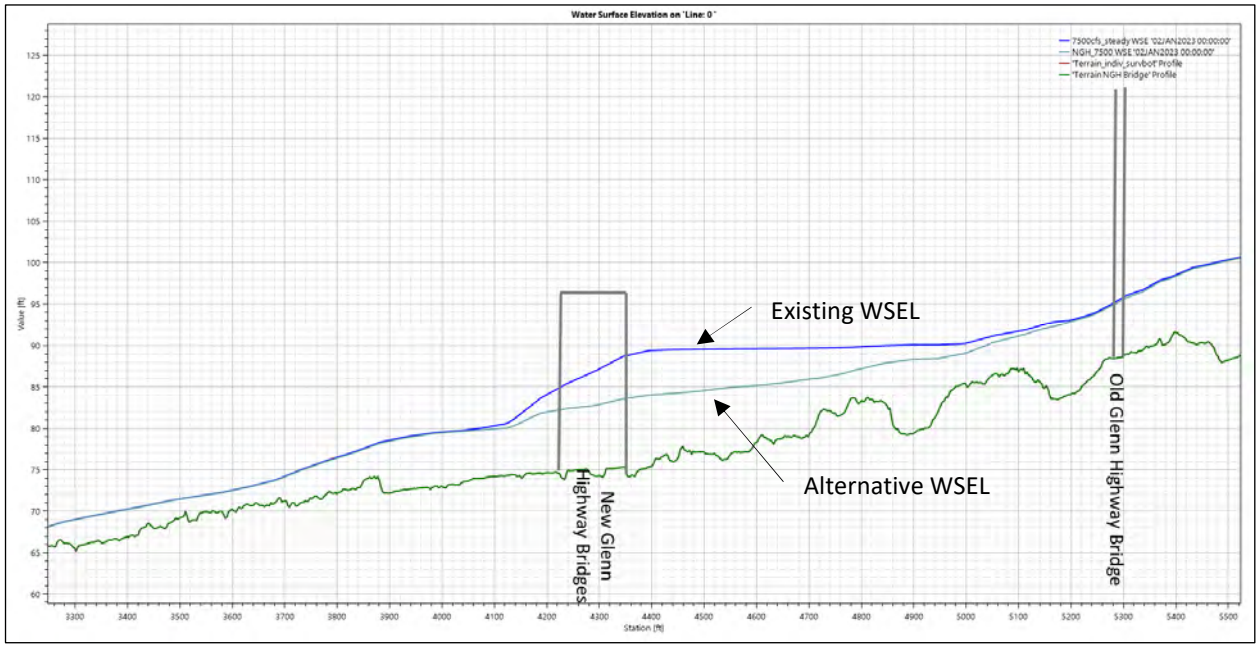

Figure 4.3-5. Existing and alternative WSEL profiles at the New Glenn Highway Bridges.

4.4 Railroad Bridge

4.4.1 General

Figure 4.4-1. Eklutna River Railroad Bridge U/S View (Left); Left Abutment Wall (Right).

The Eklutna River railroad bridge was constructed in 1927, prior to the construction of the original hydropower project on the Eklutna River in 1929. The structure consists of a riveted steel open deck girder bridge, spanning approximately 70 ft at a height of 14 ft above the riverbed. The bridge abutments consist of concrete walls of unknown depth and thickness. Photographs of the railroad bridge are provided in Figure 4.4-1.

4.4.2 Hydraulic Capacity

A 2-D HEC-RAS model was used to represent the existing crossing of the Eklutna River railroad bridge. The 1% AEP flood was input into the model to determine impacts to the bridge, corresponding to a flow of 7,460 cfs. The existing span creates a significant backwater effect upstream of the bridge under flooding conditions. The potential for contraction and abutment scouring at the bridge is high due to the constriction of flow and resultant increase of water velocity through the bridge span. The left abutment is specifically at risk for increased scour depths due to high water velocities encompassing the abutment, increasing the risk of undermining the structure. Velocities through the span reach up to 10.2 ft/s under this flood condition. This correlates to a shear stress of 9.81 lb/ft^2, capable of moving boulders as large as 26-inches.

Discussions with the Alaska Railroad indicate that there is a significant concern regarding the impact this flooding would have on the morphology of the river and regarding the potential for scour of the abutments and erosion of the embankments of the railroad at this location. The

bridge must be protected from the high velocities under the span, and the embankments must be protected from erosion that could lead to slope failure.

4.4.3 Mitigation Strategies

Based on the preliminary hydraulic analysis performed, the current span of the railroad bridge is not sufficient to pass the flood flows incurred under the proposed dam removal scenario. The bridges would need to be replaced with a bridge of larger span to reduce the backwater effect upstream of the structure, minimize velocities through the bridge span, and lessen the risks of scour at the bridge abutments and erosion of the railroad embankments.

An alternative 2-D HEC-RAS model was produced that increased the span of the Eklutna River railroad bridge from 70 ft to 325 ft. The alternative geometry expands the bridge span approximately 100 ft to the south and an additional 155 ft to the north. Slight modifications to the approach geometry were made to include a 45-degree wingwall on the left abutment to help reduce overall velocities along that surface and better distribute the flow through the span. A map of the velocities pre- and post-bridge replacement is presented in Figure 4.4-2.

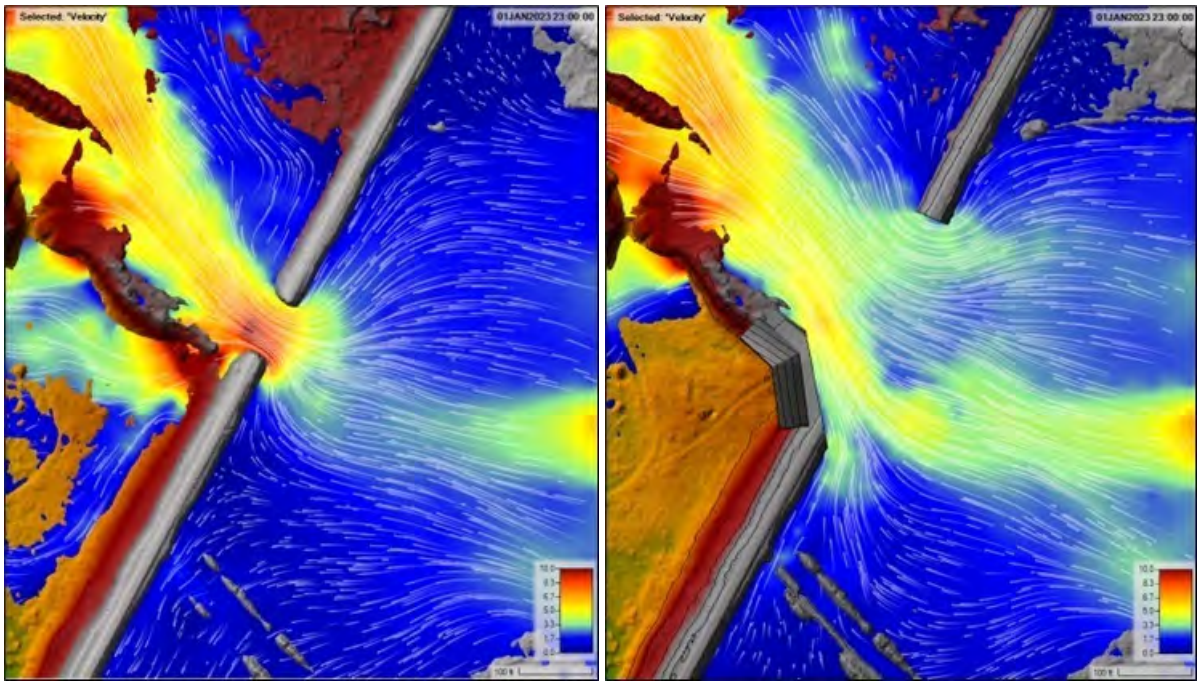

Figure 4.4-2. Plan View of Velocities (ft/s) at the Eklutna River Railroad Bridge Pre- and Post- Bridge Replacement.

This conceptual alternative produced a maximum velocity of 5.8 ft/s through the bridge span. This velocity corresponds to a maximum shear stress of 3.8 lb/ft^2 which reduces the maximum particle size capable of transport from approximately 26 inches to 9 inches. The increased span

length reduces the upstream backwater effect by approximately 2 ft of head and increases the freeboard by approximately 1 foot. The increased span would significantly decrease the potential for abutment scour; however, additional erosion protection measures would likely need to be implemented along the railroad embankments.

4.5 Eklutna Tailrace Fishery

4.5.1 General

Figure 4.5-1. Eklutna Tailrace Fishery.

The Eklutna Tailrace Fishery is operated by the Alaska Department of Fish and Game (ADFG), who began stocking the tailrace with coho salmon smolts in 1998. In 2002, they included Chinook salmon smolts as part of the Northern Cook Inlet Chinook salmon enhancement program. These stocking efforts have facilitated a very popular and sustainable salmon fishery since 2003. Salmon originating from the drainages of the Knik and Matanuska Rivers are also harvested at the confluence of the tailrace and the Knik River. Sport fishing for Chinook salmon at the tailrace continues to be a popular recreational fishery for residents. The fishery is handicap accessible and a youth only fishery takes place each year in June.

The primary purpose of the program is to maintain or increase Chinook salmon sport fishing opportunities in the Mat-Su valley. In addition to these opportunities this fishery also reduces the fishing pressure on local wild stocks. The stocking program provides alternative opportunities for anglers that might otherwise direct their efforts toward native fish that are vulnerable to over-fishing. As sport fishing pressure continues to increase in the Matanuska-Susitna Valley, hatchery fish are becoming a more important management tool to satisfy recreational demands. Chinook salmon have had significantly poor marine survival, resulting in

little to no harvest opportunities on wild stocks. This fishery plays an important role in allowing harvest for the duration of the Chinook salmon return. The goal of this fishery is to generate 10,000 angler-days annually of Chinook salmon sport fishing effort and another 6,000 angler-days directed at coho fishing.

Based on estimates provided by ADFG, an average of approximately 2,400 salmon are harvested from the fishery each year[16]. Including other species such as Dolly Varden and Arctic Char, an average of approximately 4,900 total fish are harvested from the fishery each year. A photograph of the fishery is presented in Figure 4.5-1.

4.5.2 Risk Assessment

The Eklutna Tailrace fishery receives the entirety of its water supply from the Eklutna Power Plant, which would cease operations under the dam removal scenario. With the flow supply removed, the tailrace would be unable to be stocked with salmon and utilized as a sport fishery. Quantifying the impacts that the loss of the fishery would have on the region is difficult to determine, as little to no economic data exists specific to the site. According to a 2018 publication by the McDowell Group, non-residents spent an estimated $25 million in the sport harvest of hatchery salmon and accounted for $16 million in annual labor income created directly or indirectly by Alaska's hatcheries statewide in 2016[17]. This number is limited to impacts resulting from non-resident sport harvest of hatchery salmon and should be considered conservative. Resident sport/personal use/subsistence harvest of hatchery salmon have additional economic impacts as well as significant social and cultural impacts in Alaska. Additionally, it should be noted that the Eklutna Tailrace is the only open system stocked with coho and Chinook salmon smolts, and in 2024 this is the only fishery for anglers to harvest Chinook salmon, as all other areas are restricted.

4.5.3 Mitigation Strategies

Discussions with ADFG indicate that the loss of the Eklutna Tailrace fishery would be difficult to replace elsewhere within the region. The statewide hatchery program is designed to minimize interactions with wild salmon stock and may only be replicated should a suitable site be found that is not currently a salmon-bearing anadromous stream. For the purposes of this assessment, there are no mitigation strategies that may be developed, and no estimated cost impacts associated with the loss of the Eklutna Tailrace fishery.

5.0 Preliminary Cost Estimates

Preliminary cost estimates have been developed for the proposed infrastructural modifications and mitigation strategies detailed within this memorandum. The cost estimates presented herein are consistent with a Class 5 estimate as defined by the Association for the Advancement of Cost Engineering standard Practice 69R-12[18]. The estimates were prepared by utilizing historical cost data from similarly technical projects which McMillen has designed or constructed, or from parametric comparisons of similar projects for which McMillen has obtained detailed cost breakdowns. Due to the level of uncertainty at the conceptual level of design, a contingency of 25% has been added to the costs. The accuracy range for the cost estimate at this phase of investigation is estimated to be -50% to +100%.

To account for the construction timeline proposed as part of the alternative dam removal scenario, each estimate was escalated to Q1 2034 U.S. Dollars. To escalate the proposed costs, the Civil Works Construction Cost Index System (CWCCIS) was utilized with a cost index applicable for the construction type[19]. The following subsections present the estimated costs for each of the proposed modifications or mitigation strategies employed as part of the dam removal alternative.

5.1 Eklutna Dam

The removal of Eklutna Dam involves the development of site access, demolition and excavation of the dam embankment and spillway, transport of material to the quarry, and restoration of the site as detailed in the work plan in Section 3.1.2.

A conceptual level cost estimate was developed as part of this technical risk assessment to determine the anticipated total cost for removal of the dam structure. This cost estimate is summarized in Table 5.1-1.

[18] Association for the Advancement of Cost Engineering. Recommended Practice 69R-12. Cost Estimate Classification System – As Applied in Engineering, Procurement, and Construction for the Hydropower Industries.
[19] United States Army Corp of Engineers. EM 1110-2-1304 Civil Works Construction Cost Index System. Tables 1-4. (September 2023)

Upper Cost Range			$27,162,000	+100%

5.2 Eklutna Powerplant

The proposed removal of Eklutna Dam would result in the decommissioning of the Eklutna Power Plant. While the exact details of decommissioning are not fully understood at this time, some assumptions were made regarding the abatement of hazardous materials and isolation of the plant from the reservoir as detailed in Section 3.2.2.

A conceptual level cost estimate was developed as part of this technical risk assessment to determine the anticipated total cost for the decommissioning of the power plant. This cost does not include demolition of the power plant or restoration of the site. This cost estimate is summarized in Table 5.2-1.

Table 5.2-1. Cost Estimate; Eklutna Power Plant Decommissioning.

Description	Qty	Unit Cost	Value	Notes

Upper Cost Range			$8,890,000	+100%

[1] Based on the recommended mitigation strategy for the AWWU pipeline presented in Section 4.1, costs associated with installation of a concrete plug are not included as part of this estimate.

5.3 Renewable Energy Supply

To replace the energy and capacity lost with the removal of the Eklutna Power Plant, an equivalent renewable energy supply must be constructed by the year 2034. While a 10-year horizon for the site selection, investigation, licensing, and design of a new hydroelectric project

may be feasible, it is heavily dependent on the complexity of the project and environmental concerns related to its development. For the purposes of this assessment, it is assumed an equivalent project with a 44.4 MW generation capacity is developed in accordance with the mitigation strategy outlined in Section 3.3.

To estimate costs associated with the construction of a new hydroelectric project, cost estimating tools developed by Oak Ridge National Laboratory were utilized which were developed based on a collection of contemporary cost data within the industry[20]. An equation was developed to determine the initial construction costs associated with the hydroelectric development on a new site, as presented in the following equation:

$$ICC = 8{,}717{,}830 * P^{0.975} * H^{-0.120}$$

Where:

ICC = Initial Construction Cost ($2012)

P = Project Capacity (MW)

H = Head (ft)

For a 44.4 MW project with a rated head of 800 ft, the calculated initial cost for construction, including indirect costs, is $157,847,000 (2012 $USD A summary of the cost escalation and anticipated costs of the project construction are presented in Table 5.3-1.

Table 5.3-1. Cost Estimate; Development of New Hydroelectric Project.

Description	Value	Notes
Estimated Construction Costs	$157,847,000	Q1 2012 $USD
Cost Index (2012)	722.83	Powerplant Index Q1 2012
Cost Index (2034)	1375.93	Powerplant Index Q1 2034
Expected Construction Costs	$300,467,000	2034 $USD
Engineering/Licensing Costs	$15,023,000	5% Total Contract Amount
Total Cost	**$315,490,000**	Excludes Transmission Lines
Lower Limit	$157,745,000	-50%
Upper Limit	$630,980,000	+100%

It shall be noted that the cost estimate detailed above does not include costs associated with the construction of new transmission lines to the site. Development of transmission to a site could make up a considerable portion of the Project cost, dependent on the location identified.

[20] Oak Ridge National Laboratory. Hydropower Baseline Cost Modeling. (January 2015). Pub53978.pdf (ornl.gov)

For comparison purposes, a cost estimate was developed to determine the present worth of the replacement energy should the energy obtained from the Eklutna Power Plant be replaced by energy from the existing fossil fuel generation fleet. This analysis assumes a future price of $13.05 per Thousand Cubic Feet (MCF) of natural gas, as provided by the utilities as a projection to the year 2026. The production cost of running the fossil fuel generation fleet at this rate results in an energy price of $84.65/MWh with an escalation of 1% per annum, as detailed in the Cost Effectiveness Modeling technical memorandum as part of the Draft Fish and Wildlife Program[21]. Additionally, a price of $48M must be included to procure and install a new generating unit at the Eklutna Generation Station (EGS) to allow MEA to meet their capacity reserve requirements as required by the IMC. A summary of the replacement costs of energy should the project be replaced by fossil fuel sources is provided in Table 5.3-2 for comparison purposes.

Table 5.3-2. Cost Estimate; Replacement of Energy from Fossil Fuel Sources.

Description	Value	Notes
Average Annual Energy	168,588 MWh	Average Annual Output; EPP
Energy Rate	$84.65/MWh	Based on $13.05/MCF
Annual Replacement Cost	$14,271,000	
Expected Lifetime of Asset	50 Yrs	
Present Worth of Replacement Energy	$305,606,000	Includes 1% Escalation in Energy
Cost for Additional EGS Unit	$48,000,000	Per MEA Estimate
Present Worth of Energy and Capital Cost	**$353,606,000**	

The comparison indicates that the lifetime costs for replacement of energy with the existing fossil fuel fleet may exceed that of the development of a new renewable hydropower resource on the Railbelt. For the purposes of this assessment, the estimated costs for development of a new hydroelectric project will be considered as part of the overall impacts of the alternative.

5.4 AWWU Water Supply Infrastructure

The proposed mitigation strategy as part of this technical risk assessment for the impacts to the AWWU Water Supply Infrastructure is to construct a new pipeline from the EWTF to the Eklutna Power Plant as discussed in Section 4.1.3.2. While no engineering design has been performed at this stage for the hypothetical pipeline construction, we may estimate the order

[21] Chugach Electric Association, Matanuska Electric Association, and Municipality of Anchorage. Appendix D – Supporting Data for Cost Effectiveness Model Technical Memorandum. https://eklutnahydro.com/wp-content/uploads/2023/10/2023-10-27-Eklutna-Draft-Fish-and-Wildlife-Program_with-Appendices.pdf

of magnitude costs parametrically by utilizing the construction costs for the existing Eklutna Water Project pipeline segment P-4 constructed in 1987[22]. A summary of the cost escalation and anticipated costs of the pipeline construction are presented in Table 5.4-1.

Table 5.4-1. Cost Estimate; AWWU Water Supply Infrastructure Mitigation Strategy.

Description	Value	Notes
Original Contract Amount	$7,257,106	October 1987 $USD
Cost Index (1987)	366.08	Composite Index Q4 1987
Cost Index (2034)	1494.69	Composite Index Q1 2034
Expected Contract Amount	$29,630,474	January 2028 $USD
Original Distance (mi.)	6.1	Pipeline Segment P-4
Cost per Mile	$4,857,455	$/Mi
Anticipated Distance (mi.)	9.6	Hypothetical Alignment
Anticipated Pipeline Cost	$46,632,000	
Engineering/Licensing Costs	$2,332,000	5% Total Contract Amount
Total Cost	**$48,964,000**	
Lower Limit	$24,482,000	-50%
Upper Limit	$97,928,000	+100%

5.5 New Glenn Highway Bridge

The proposed mitigation strategy as part of the technical risk assessment for the impacts to the New Glenn Highway Bridges involves the replacement of both bridges with wider and longer span structures. The new bridges would have a span of 250 ft based on the results of the hydraulic analysis and a width of 43 ft per recommendations from the DOT. At this span, a central drilled pile would be required at about midpoint of the bridge. Both abutments are anticipated to be founded on deep foundations. The existing bridges are to be demolished and constructed one at a time and the total work effort is anticipated to occur over two construction seasons. The cost estimate assumes that a traffic control plan would be in place with both spans of the New Glenn Highway traffic utilizing one or the other bridge during construction activities. Due to the high levels of traffic on this highway, this may not be a reasonable assumption and a temporary bridge may need to be constructed which is not included within these costs. Typical parametric costs for highway bridges in $/ft^2 were provided by the DOT. Demolition and traffic control costs were obtained from reference DOT bid data from recent

[22] Municipality of Anchorage Water & Wastewater Utility. Final Payment Estimate, Contract Performance. Eklutna Water Project Pipeline Segment P-4. (December 1987).

highway and bridge projects. A summary of the anticipated costs of the New Glenn Highway Bridges are presented in Table 5.5-1.

Table 5.5-1. Cost Estimate; New Glenn Highway Bridge Mitigation Strategy.

Description	Unit	Unit Cost	Value	Notes
Division 01 Indirects				
Mobilization and Establishment of Site Infrastructure	10%	$20,850,000	$2,085,000	10% Direct Costs

5.6 Railroad Bridge

The proposed mitigation strategy as part of the technical risk assessment for the impacts to the Eklutna River railroad bridge involves the replacement of the bridge with a longer span. The new bridge would have a span of 325 ft and additional erosion protection measures would be implemented along the railroad embankments to prevent future erosion under flood conditions. Typical parametric costs for railroad bridges in $/ft were provided by the Alaska

Railroad. A summary of the anticipated costs of the new railroad bridge is presented in Table 5.6-1.

6.0 Risk Assessment Summary

This memorandum details the technical risks and associated costs necessary for the alternative related to the removal of the Eklutna Dam, as well as a comprehensive evaluation of various mitigation strategies to offset the consequent impacts on associated infrastructure. It is important to note that this assessment does not make assumptions regarding the allocation of these costs or identify the responsible parties. Instead, its primary purpose is to provide a high-level overview of the essential infrastructural modifications necessary to restore the Eklutna River to an unregulated state. The following subsections summarize the impacts to infrastructure, mitigation strategies, and costs associated with the dam removal alternative.

6.1 Eklutna Dam

Under this alternative the Eklutna Dam would be removed. The site would be restored to the natural topography of the streambed and site vegetation restored. The Eklutna River would return to its natural state with the exception of flows withdrawn for water supply purposes for AWWU. The work would likely take place over the course of one construction season and is expected to cost approximately $13.6M (USD $2034).

6.2 Eklutna Power Plant

Following the removal of Eklutna Dam, the power plant would be taken offline and the facility decommissioned. The current assumption is that the facility would be left in place after removal of all hazardous materials occur. The site would be fenced and security measures in place to prevent risk to the public. The work would take place over the course of one construction season and is expected to cost approximately $4.4M (USD $2034).

6.3 Renewable Energy Supply

The removal of Eklutna Dam and decommissioning of the power plant would result in the loss of a firm, dispatchable renewable energy source for the Railbelt. A reduction in 44.4 MW of capacity and an average of 169 GWh per year in energy would need to be replaced with an equivalent firm, dispatchable renewable source. While the design and site selection of an equivalent source is not anticipated to occur as part of this investigation, a project of similar capacity is anticipated to cost approximately $315.5M (USD $2034).

6.4 AWWU Water Supply Infrastructure

With the Eklutna Dam removed and the river flowing in an unregulated state, the existing AWWU infrastructure including the pipeline, road, and maintenance bridges are at particular risk of damage during flood conditions. Given the critical nature of this infrastructure to supply

water to the MOA, the pipeline is assumed to be re-routed out of the Eklutna riverbed and would follow the alignment of the highway from the EWTF to a connection point at the Eklutna Power Plant penstock. This work would take place over the course of two construction seasons and is expected to cost approximately $49.0M (USD $2034).

A secondary impact to the water supply that may be unavoidable is related to the ability for the natural lake to supply municipal water releases without a dam. Based on historical water supply withdrawals, the lake would be withdrawn below its natural crest thus dewatering the Eklutna River or requiring water supply curtailment in dry years. This impact would become much greater should AWWU increase withdrawals from the lake beyond their historical levels.

6.5 Old Glenn Highway Bridge

The Old Glenn Highway Bridge has sufficient hydraulic capacity to pass flood flows post-dam removal. Some additional scouring would result at the bridge pier located within the floodplain of the river; however, this is not anticipated to put the bridge at risk pending further investigation. No mitigation measures are proposed at the Old Glenn Highway Bridge as part of this assessment.

6.6 New Glenn Highway Bridges

The New Glenn Highway Bridges do not have sufficient hydraulic capacity to pass flood flows under the unregulated flow of the Eklutna River and are at risk of damage. The bridges would need to be replaced with a longer span segment to reduce the hydraulic contraction at this location of the river and increase freeboard during flooding conditions. This work would take place over the course of two construction seasons and is expected to cost approximately $51.5M (USD $2034).

6.7 Railroad Bridge

The railroad bridge does not have sufficient hydraulic capacity to pass flood flows under the natural flow of the Eklutna River and is at risk of damage due to scour of the abutments. The bridge would need to be replaced with a longer span segment to reduce the hydraulic contraction at this location of the river, increase freeboard during flooding conditions, and reduce the average velocities through the span during flooding. This work would take place over the course of one construction season and is expected to cost approximately $84.8M (USD $2034).

6.8 Cost Estimate Summary

To accommodate the construction timeline for the proposed alternative dam removal scenario, each cost estimate was adjusted to reflect Q1 2034 U.S. Dollars. For clarity purposes, the cost estimate summary provides the equivalent costs in Q1 2024 U.S. Dollars to allow for direct comparison to other alternatives presented by stakeholders. A breakdown of the estimated costs for the proposed infrastructural adjustments and mitigation strategies, expressed in both 2024 and 2034 U.S. Dollars, is detailed in Table 6.8-1.

Table 6.8-1. Cost Estimate Summary

Description	Cost ($2024)	Cost ($2034)	Notes
Eklutna Dam Removal	$10,496,000	$13,581,000	
Eklutna Power Plant Decommissioning	$3,439,000	$4,445,000	
New Hydroelectric Project	$243,820,000	$315,490,000	
Re-route AWWU Pipeline	$37,880,000	$48,964,000	
New Glenn Highway Bridge Replacement	$39,830,000	$51,484,000	
Railroad Bridge Replacement	$65,639,000	$84,843,000	
Total Cost	**$401,104,000**	**$518,807,000**	
Lower Limit	$200,552,000	$259,403,500	-50%
Upper Limit	$802,208,000	$1,037,614,000	+100%

Technical Memorandum

To:	Eklutna Project Owners	Project:	Eklutna Fish & Wildlife Program
From:	Anna Lampman, McMillen, Inc.	cc:	Samantha Owen, McMillen, Inc.
Date:	April 15, 2024	Job No:	24-021
Subject:	Summary and Analysis of Public Comments on the Draft Fish and Wildlife Program		

1.0 Public Comment Process

Per the requirements of the 1991 Fish and Wildlife Agreement (1991 Agreement), the owners of the Eklutna Hydroelectric Project (Chugach Electric Association [CEA], Matanuska Electric Association [MEA], and the Municipality of Anchorage [MOA], collectively referred to as the "Project Owners") distributed the Draft Summary of Study Results and Draft Fish and Wildlife Program (Draft Program) to the Parties to the 1991 Agreement (National Marine Fisheries Service [NMFS], U.S. Fish and Wildlife Service [USFWS], and the State of Alaska represented by the Alaska Department of Fish and Game [ADFG], Alaska Department of Natural Resources [ADNR], and the Alaska Department of Environmental Conservation [ADEC]) and the Native Village of Eklutna (NVE) on October 27, 2023. The Project Owners received comment letters from the Parties, NVE, and Eklutna, Inc. and met with each entity in December 2023 to attempt to resolve differences. The Project Owners then held a series of public meetings in January 2024 and received public comment through February 19, 2024. Both draft documents and all comments received are publicly available on the Project website (www.eklutnahydro.com).

1.1 Public Meetings

The 1991 Agreement specifies that once the Project Owners received comments and recommendations on the Draft Program from the Parties, they must hold at least one public meeting each in Anchorage and the Matanuska Valley to receive public comments on the Draft Summary of Study Results, the Draft Program, and the comments and recommendations of the Parties. Per the 1991 Agreement, the Project Owners published notices about the public meetings in the Anchorage Daily News, the Frontiersman, and the People's Paper. These newspapers serve Anchorage, the Matanuska Valley, and Eagle River. The notices specified meeting places, times, and dates; where studies, reports, and recommendations could be obtained for review; and where written comments could be sent. The locations, times, and dates of the public meetings were also presented on the Project website homepage. The Project Owners advertised the public meetings in their member newsletters, social media, and announcements at civic meetings, including the Chambers of Commerce and community

councils. The Project Owners went beyond the requirements of the 1991 Agreement and held a total of six public meetings: two in Anchorage, two in the Matanuska Valley, and two in Eagle River. Public meetings were held at the following dates, times, and locations:

1. January 16, 2024, 2:00 – 4:00 p.m., Palmer Community Center (Depot), Palmer (36 people in attendance)
2. January 16, 2024, 6:00 – 8:00 p.m., Palmer Community Center (Depot), Palmer (23 people in attendance)
3. January 17, 2024, 2:00 – 4:00 p.m., The Arctic Rec Center, Anchorage (45 people in attendance)
4. January 17, 2024, 6:00 – 8:00 p.m., The Arctic Rec Center, Anchorage (37 people in attendance)
5. January 18, 2024, 2:00 – 4:00 p.m., Workplace and Event Center, Eagle River (37 people in attendance)
6. January 18, 2024, 6:00 – 8:00 p.m., Workplace and Event Center, Eagle River (28 people in attendance)

At each public meeting, the Project Owners gave a presentation describing what was included in the Draft Program and why, as well as what was not included in the Draft Program and why. The subject matter experts that conducted each study were available to answer questions on their respective studies and had posters summarizing the study results. Sign in sheets from each public meeting are included in Appendix A.

1.2 Opportunities to Submit Public Comments

The Project Owners accepted public comments from October 27, 2023 (the date the Draft Program was publicly available for review) through February 19, 2024 (30 days after the final public meeting). Throughout the public comment period, comments were submitted via email (info@eklutnahydro.com) or the “Contact Us” form on the Project website (www.eklutnahydro.com).

At each public meeting, comment forms were available for members of the public to fill out and submit on-site or to take with them and mail in later. Members of the public could opt to submit their comments verbally by making a 3-minute (or less) audio recording. The Project email address was advertised on the comment forms available at each public meeting and on the home page of the Project website. A QR code directing users to the “Contact Us” page on the Project website was also printed on all comment forms.

2.0 Public Comment Summary

Public comments were received via audio recording at the public meetings, comment forms distributed at the public meetings, emails to info@eklutnahydro.com, submissions on the www.eklutnahydro.com website, and form letters submitted through Trout Unlimited, The Alaska Center, and SalmonState. The Project Owners sent a response to each person who submitted their comment electronically, including form letters, to acknowledge receipt. Table 2-1 shows the number of public comments received in each format.

Table 2-1: Public Comment Breakdown

Format	Total
Audio Recordings	**3**
Comment Forms	**19**
Emails	**241**
Website Submissions	**110**
Form Letters	**1,299**
Total	**1,672**

2.1 Individual Comments

Table 2-2 provides a breakdown of the total number of individual comments received in each format as well as the general message of the comment. Verbatim copies of all individual comments received are provided in Appendix B, including transcriptions of the three audio recordings, and discussed in further detail in the sections below.

Table 2-2: Individual Comments Breakdown

Format	No Action	Support River Restoration	Support Draft Program	Against Draft Program	Support Dam Removal	Against Dam Removal	Questions / Other	Total
Audio Recordings	--	--	--	2	1	--	--	**3**
Comment Forms	1	1	3	4	5	3	2	**19**
Emails	2	10	19	23	76	87	24	**241**
Website Submissions	8	2	9	6	27	46	12	**110**
Total	**11**	**13**	**31**	**35**	**109**	**136**	**38**	**373**

2.1.1 Support No Action

One comment form from the public meeting, two emails, and eight website submissions (11 comments total) were received that did not support any changes to the existing Eklutna Project. These comments generally did not want any changes to the existing infrastructure or operations of the Project, essentially representing a "no action" alternative. An increase in costs to the ratepayer associated with all other alternatives was the primary factor influencing these comments. The loss in hydropower and drinking water resources was also important to these commenters. Several commenters also believed the anticipated salmon population for the Eklutna River to be low considering the overall cost of the alternatives presented.

2.1.2 Support General River/Salmon Restoration

One comment form from the public meetings, 10 emails, and two website submissions (13 comments total) were received that called for general river and salmon restoration in the Eklutna River. Most of the comments in this category were very general, showing support for bringing salmon populations back to the Eklutna River. These comments did not specifically support or oppose the Draft Program and did not mention dam removal as an alternative. Some of the comments stated that hydropower and drinking water were important resources provided by the Project, but that restoring salmon to the Eklutna River was also important.

2.1.3 Support Draft Program

Three comment forms from the public meetings, 19 emails, and nine website submissions (31 comments total) were received that explicitly stated the commenters support of the Draft Program. The general themes expressed in the comments were:

- The Draft Program is a good compromise between hydropower and drinking water resources and fisheries resources and the environment.
- The Draft Program was well drafted, well presented at public meetings, thorough, thoughtful, well written, and easy to understand.
- Support for hydropower as an affordable and reliable renewable energy source.
- Support for the AWWU Portal Valve alternative to improve habitat for salmon in the Eklutna River as well as recreational opportunities.
- The Draft Program followed the requirements of the 1991 Agreement.

2.1.4 Against Draft Program

Two audio recordings and four comment forms from the public meetings, 23 emails, and six website submissions (35 comments total) were received that were against the Draft Program. The comments in this category did not mention dam removal and were only comments on the Draft Program. Comments against the Draft Program included:

- Proposed minimum flows in the Eklutna River will not provide suitable aquatic habitat.
- The Draft Program leaves one mile of the river dry, from the Eklutna Dam to the AWWU Portal Valve, compromising salmon habitat in the Eklutna River.
- The Draft Program fails to mitigate the damages done to sockeye salmon by preventing them from entering Eklutna Lake to spawn.
- The Draft Program does not meet the requirements of the 1991 Fish and Wildlife Agreement.
- The development of the Draft Program did not follow the processes outlined in the 1991 Agreement.
- The proposed AWWU Portal Valve alternative is too costly for the lack of benefits it provides.
- The Draft Program does not sufficiently mitigate adverse impacts to NVE.
- Requests for a 2-year extension of time to perform additional analysis, consultation, and coordination with affected parties before proposing a Final Fish and Wildlife Program.

2.1.5 Support Dam Removal

One audio recording and five comment forms from the public meetings, 76 emails, and 27 website submissions (106 comments total) were received that supported removal of Eklutna Dam. Some of the comments showed opposition to the Draft Program, while others did not mention the Draft Program and only supported dam removal.

Many of the comments expressed support for the Community Plan to Bring Back the Eklutna (Community Alternative) put forth by NVE, Trout Unlimited, The Conservation Fund, and The Alaska Center on the www.eklutnariver.org website. The Community Alternative calls for "*removing the Eklutna Lake dam within the next decade, when replacement renewable energy is expected to be available*."

2.1.6 Against Dam Removal

Three comment forms from the public meetings, 87 emails, and 46 website submissions (136 comments total) were received that were against the removal of Eklutna Dam. These comments did not mention or comment on the Draft Program and only discussed opposition to dam removal. The reasoning behind these comments included the costs associated with finding an alternative energy and water source, support for hydropower as a reliable renewable energy source, and fear of losing Anchorage's primary drinking water source. Some comments were also skeptical that removal of Eklutna Dam would result in flourishing salmon populations. Recreational resources at Eklutna Lake as well as existing salmon populations in the tailrace of the Project were also discussed as resources that would potentially be adversely affected by dam removal/decommissioning of the Project.

2.1.7 Questions/Other

The remaining two comment forms, 24 emails, and 12 website submissions (38 comments total) received during the public comment period were either questions about the Draft Program or did not fall into one of the aforementioned categories. Some of these comments discussed the desire to keep electricity rates low and did not state support or opposition to the Draft Program or dam removal. Other commenters presented their own ideas for consideration in the Draft Program or made broad overarching statements about river restoration and hydropower.

2.2 Form Letters

When NVE recommended dam removal in their comment letter on the Draft Program, several organizations including Trout Unlimited, the Alaska Center, and SalmonState initiated campaigns to advocate for dam removal. These campaigns included providing form letters on their websites for the public to sign their name and submit. Trout Unlimited distributed four different versions of a form letter, while The Alaska Center and SalmonState only distributed one. A copy of each form letter received, as well as the names of commenters who signed the form letters, is included in Appendix C.

A total of 1,299 form letters were received during the comment period. Most of the form letters received were from out of state (777 total) and some were received from parts of Alaska outside the Project service area (93 total); 429 form letters were received from residents within MEA, Chugach, and/or MOA service areas. A breakdown of the form letters received, including the area of residence and the organization responsible for posting the form letter, is shown in Table 2-3.

Table 2-3: Form Letter Breakdown

Form Letter	From Service Area	From Other Parts of Alaska	From Out of State	Total
Trout Unlimited	**222**	**21**	**115**	**358**
Version 1	43	4	51	98
Version 2	137	15	27	179
Version 3	35	2	37	74
Version 4	7	--	--	7
The Alaska Center	**155**	**38**	**44**	**236**
SalmonState	**52**	**34**	**618**	**704**
Total	**429**	**93**	**777**	**1,298**

Aside from Versions 2 and 3 of the Trout Unlimited form letters, which called for general river and salmon restoration on the Eklutna River, all of the form letters were against the Draft Program and supported removal of Eklutna Dam.

Several commenters submitted form letters more than once. In these instances, the first form letter received from an individual, regardless of which version, was kept in the record and all other submissions were removed.[1]

3.0 Analysis

3.1 Individual Comments

In general, the individual comments received showed an even divide between commenters who opposed or supported general river/salmon restoration, who opposed or supported the Draft Program, and who opposed or supported dam removal, as seen in Figure 3-1 below. The largest variation was regarding dam removal with more individual commenters against dam removal (56%) than support it (44%). In general, this shows that individual commenters are nearly evenly divided on general river/salmon restoration, the Draft Program, and dam removal.

[1] A total of 287 repeat commenter form letters were removed from the record.

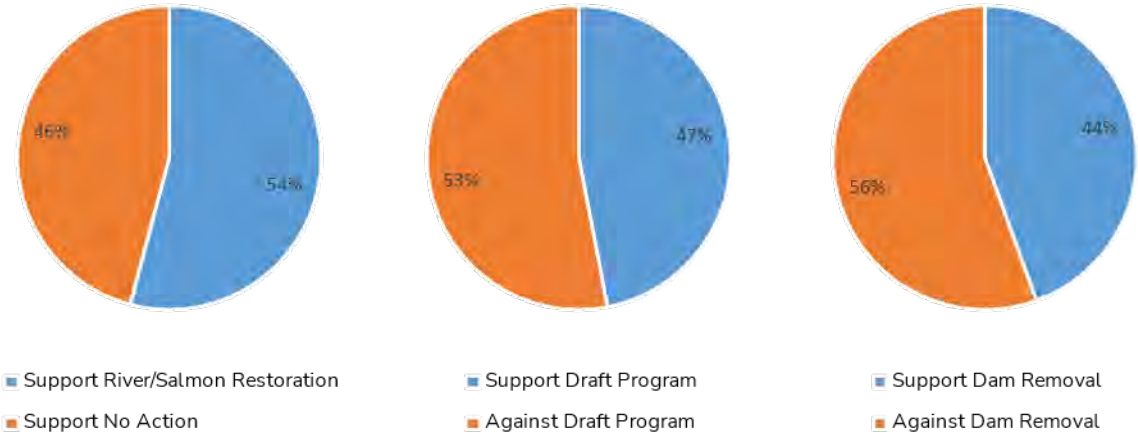

Figure 3-1. Percent of Individual Comments in each Category

The most individual comments received in any one category were comments against dam removal (136 total) followed by support for dam removal (109 comments) as shown in Figure 3-2 below. The number of comments supporting or against the Draft Program were 31 and 35, respectively, while the number of comments supporting or against general river/salmon restoration were 13 and 11, respectively.

Individual comments were analyzed separately than form letters. Because some of the form letters did not mentioned the Draft Program, it is possible that many commenters who submitted form letters were not aware of the details of the alternatives proposed in the Draft Program nor were they commenting directly on the Draft Program.

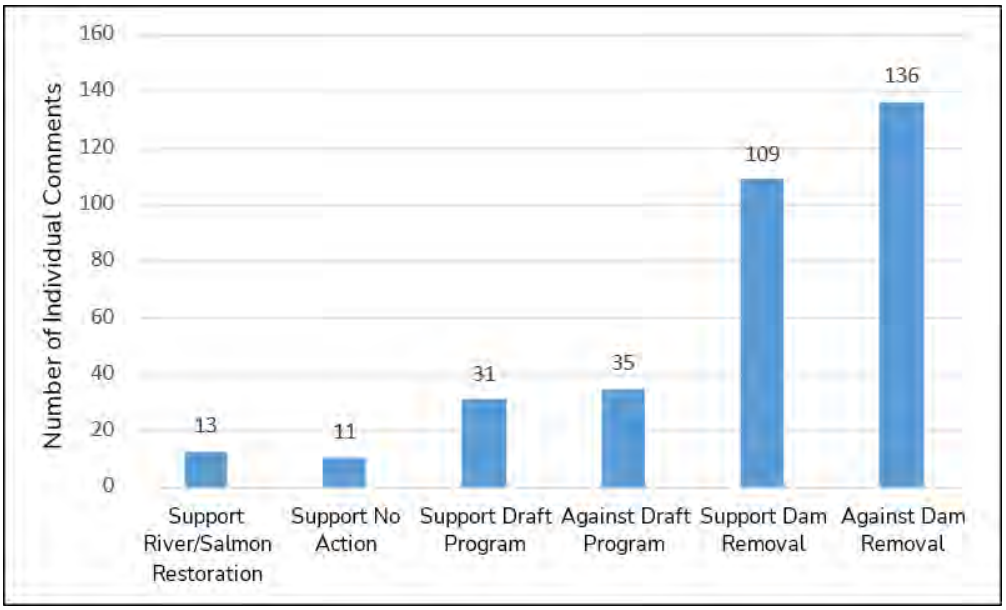

Figure 3-2. Number of Individual Comments in each Category

3.2 Form Letters

Most (60%) of the form letters received were from out of state (see Figure 3-3), while a third (33%) were from the combined CEA and MEA service area and 7% were from within Alaska but outside the Project service area.

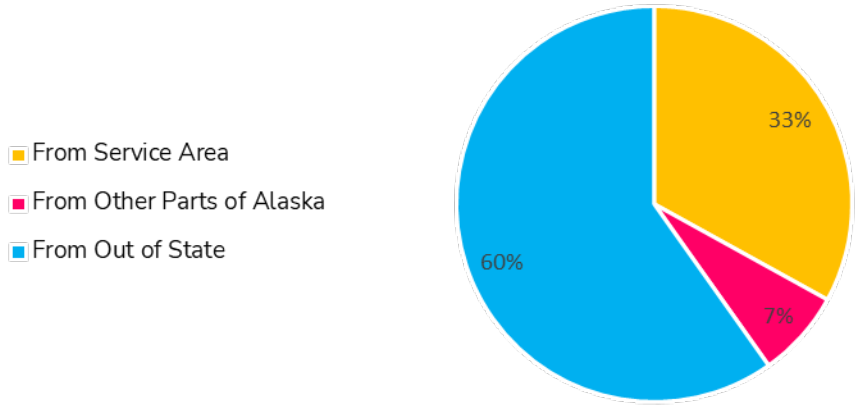

Figure 3-3. Percent of Form Letters from Inside the Service Area, Outside the Service Area, and Outside the State

A majority of the out-of-state form letters were the SalmonState version followed by Trout Unlimited. Overall, a majority of the Trout Unlimited and The Alaska Center form letters received were from the Project service area.

In total, 429 form letters were received from the Project service area, while 777 form letters were received from out of state and 93 were received from other parts of Alaska outside the service area.

Some of the form letters did not mention the Draft Program in any way, indicating that many of the commenters who submitted form letters may not have been aware of the Draft Program. This likely stems from the fact that the form letters were created in response to the dam removal campaign, and only discuss the removal of the Eklutna Dam.

Through responding to the commenters, it came to the attention of the Project Owners that The Alaska Center was submitting form letters on behalf of individuals by calling individuals and collecting their information over the phone and then submitting it through the form letter system. One such commenter responded to the info@eklutnahydro.com email address stating that she was confused by the phone call and wished for her comment and name to be removed from the record.

Additionally, Version 2 of the Trout Unlimited form letters states "*As ratepayers and residents of the area, we encourage you to move quickly to restore this important river*". It is notable that several commenters that signed and submitted this form letter are neither ratepayers nor residents of the area, with 15 of 179 of these form letters from parts of Alaska outside the service area and 27 from out of state.

Figure 3-4 shows a timeline of when each form letter was received. Most form letters were received on Friday, January 19 and Friday, February 16. This is likely due to the fact that the public meetings were held the week prior to Friday, January 19 and the deadline to submit comments was February 19. In general, Fridays showed the highest influx of form letters when compared to other days of the week.

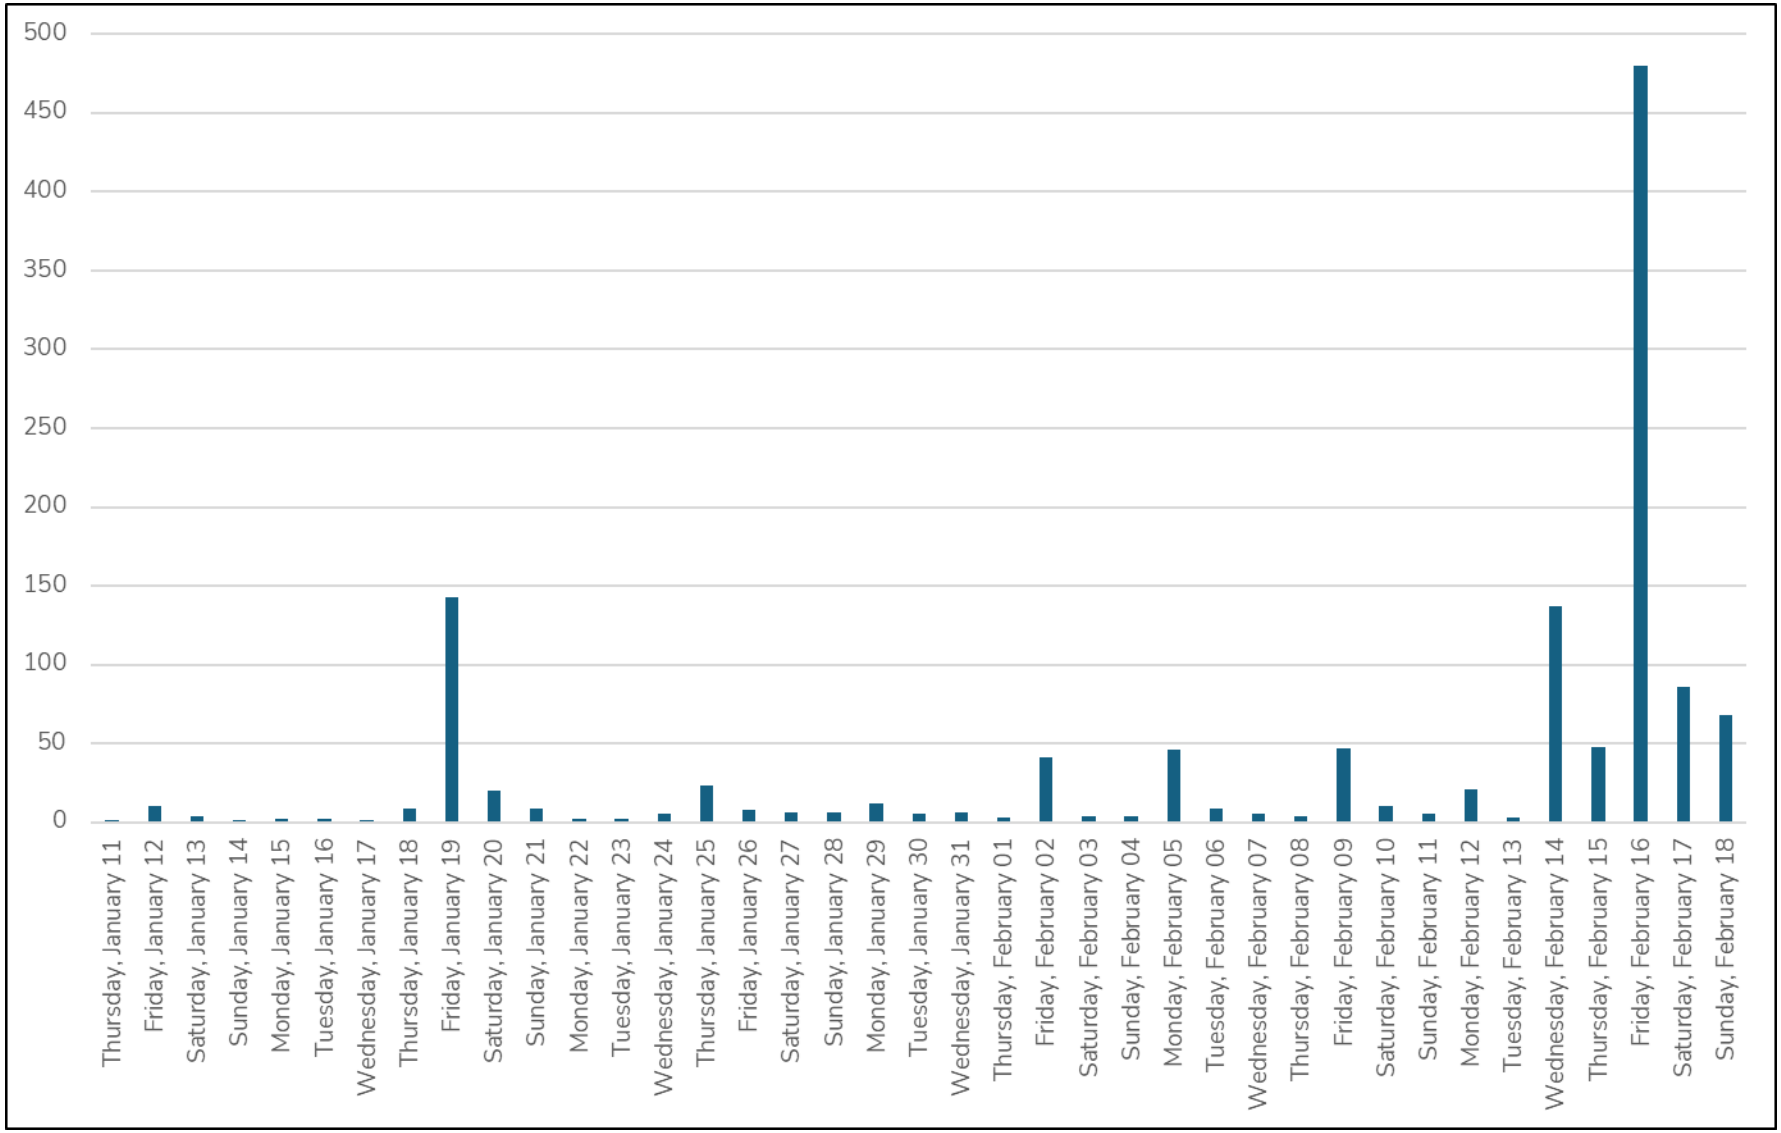

Figure 3-4: Timeline Showing when Form Letters were Received

4.0 Conclusion

Public comments were received by the Project Owners from October 27, 2023, to February 19, 2024. Both individual comments and form letters were received, with the individual comments analyzed separately from the form letters. Individual comments primarily addressed dam removal and the Draft Program, with comments supporting and opposing both dam removal and the Draft Program essentially evenly split. Several form letters from three organizations were received during the comment period; however, most of these form letters were from out of state. The form letters called for removal of Eklutna Dam.

B-1. Support No Action

This page intentionally left blank.

BIRCHWOOD, ALASKA
BCCR No. 3

A RESOLUTION OF THE BIRCHWOOD COMMUNITY COUNCIL IN SUPPORT OF EFFORTS TO RESTORE THE EKLUTNA RIVER.

WHEREAS, the Eklutna River watershed has been in a badly degraded condition since 1929 due to hydro power dams and water diversions; and

WHEREAS, a principal impact from hydro power development in the Eklutna watershed is the loss of the Eklutna River's salmon runs; and

WHEREAS, the Eklutna River still supports five species of salmon, including Cook Inlet king salmon and sockeye salmon, though in greatly diminished numbers from historical levels; and

WHEREAS, Eklutna Incorporated, the village corporation for Eklutna, is the largest landowner in the Municipality of Anchorage and owns most of the land along the Eklutna River and around Eklutna Lake; and

WHEREAS, the Native Village of Eklutna and Eklutna Inc. have made substantial contributions to the development of the Municipality of Anchorage providing land for school sites, highways, railroads, power lines and rights-of-way; and

WHEREAS, The Native Village of Eklutna, Eklutna Inc., and The Conservation Fund collaborated on a $7.5 million project to dismantle the Lower Eklutna River dam; and

WHEREAS, sediments accumulated behind the Lower Eklutna River Dam remain in the river channel due to low water flow conditions; and

WHEREAS, little to no water flows out of Eklutna Lake into the Eklutna River because of water diversions for the Eklutna Power Project; and

WHEREAS, restored in stream flow is necessary to flush the accumulated sediments downstream and allow for the recovery of salmon habitat; and

WHEREAS, stabilized lake levels and fish passage for upstream and downstream migrating salmon to and from Eklutna Lake would restore important spawning and rearing habitat for salmon; and

WHEREAS, the Municipality of Anchorage retains a majority interest (52%) in the Eklutna Power Project; and

WHEREAS, the restoration of in stream flow to the Eklutna River and restored fish passage to and from Eklutna Lake are the most desirable forms of mitigation for impacts caused by the Eklutna Power Project; and

WHEREAS, an experimental three-week period of flushing flows in September 2021 allowed for some sediment transport and re-establishment of the river channel, allowing for more meaningful study results and better mitigation design; and

WHEREAS, the request for restored in stream flow in 2022 was denied by the Eklutna Power Purchasers; and

WHEREAS, the Watershed and Natural Resources Advisory Commission of the Municipality of Anchorage supported restoration of the Eklutna River with the passage of Resolution WNRC 2019-03 titled “A Resolution Regarding Restoration of the Eklutna River”; and

WHEREAS, the Alaska Federation of Natives (AFN) supported restoration of the Eklutna River with passage of Resolution 20-17 “to restore traditional rivers and

THE BIRCHWOOD COMMUNITY COUNCIL RESOLVES:

Section 1. The Birchwood Community Council recognizes that restoration of the Eklutna River, including allowing salmon passage the length of the Eklutna River, to and from Eklutna Lake, and into headwater tributaries, will benefit the Native Village of Eklutna and residents of the Municipality of Anchorage and is a priority of the Municipality in a manner consistent with the requirements of the 1991 Agreement.

Section 2. The Birchwood Community Council supports the restoration of the Eklutna watershed, including providing instream flow and fish passage the length of the Eklutna River and into Eklutna Lake and requests that, Chugach Electric Association, and Matanuska Electric Association commit as well.

Section 3. This resolution shall be effective upon passage and approval.

PASSED AND APPROVED by the Birchwood Community Council this 14th day of December, 2022.

Write your comments on the Draft Fish and Wildlife Program here:

The people of the Native Village of Eklutna have used Eklutna Lake for thousands of years. They hunted, fished, and harvested food off the land and Lake for all of those years.

Because of progress the Native people have had to adapt and give up their way of life.

Restoring the Eklutna River to enable spawning would also help restore a part of their way of life. This might help the Athabascan people of the Native Village of Eklutna to feel that their voice matters.

Many Native people have moved to

Anchorage because of the high cost of village living. Subsistence fish from Eklutna River would bring them comfort.

When Eklutna people moved from Knik there was no Alaska Railroad, Glenn Hwy or Dam on the River. Their way of life changed dramatically because the Village was surrounded by the highway and railroad.

Asking that fish return to Eklutna River, to me, would prove that Native Village of Eklutna voice matters.

Subject:	river mitigation
Date:	Thursday, January 25, 2024 12:27:45 PM

Thanks for advertising these mitigation proposals for Eklutna dam. There are other ways to use water flow - in-river turbines or tidal generators - to produce electricity. Unlike dams, these methods have less effect of Fish migration and all the wealth that migration brings.

For the dake of future generations, please enact a program that does not impede Fish travel and spawning.

Thanks,
Sammy Taylor

I support adding fish back into the river, but think having the hydo is still a needed benefit. Why cant there be proposed solutions to add a fish ladder or tunnels to allow them around the dam. past fish stories are numerous and will take a long time to recover, if it ever does. we have got to be able to have renewable energy without harming our food source.

Thank you for your time and efforts on matters that help us provide fresh fish to our table.

Dear Owners of The Eklutna Hydroelectric Project,

Restoration of Eklutna water & fish ways is super duper important to everybody! Doing the right thing is not always easy. But it's always right.

Sincerely,
Marla Sanders

Re: National Tribal Water Council Letter of Support Regarding the Native Village of Eklutna's Resolution 2022-4: "Łiq'a nagh qinqtudeł - We are hopeful the salmon will return to us."

Dear Ms. Owen:

In 2008, the National Tribal Water Council (NTWC/Council) was formed by the U.S. Environmental Protection Agency (EPA) to provide EPA with technical input from Indian country, to strengthen EPA's coordination with Indian tribes, and to work with EPA to better understand issues and challenges faced by tribal governments and Alaska Native Villages as they relate to EPA water programs and initiatives. The NTWC provides tribes, tribal communities, and tribal organizations with research and information for decision-making regarding water issues and water-related concerns. Furthermore, the NTWC advocates for the best interests of federally-recognized Indian and Alaska Native tribes and tribally-authorized organizations in water-related matters. The NTWC advocates for the health and sustainability of clean and safe water, and the productive use of water for the health and well-being of Indian country. The NTWC takes its role seriously and has provided input to EPA on many water issues since the Council's inception.

Many of the environmentally related matters that impact tribal sovereignty and sustainability are important to discuss and ensures tribes' ability to ensure water-life ways are protected for generations and generations. One water-life ways concern has come to our attention by the Native Village of Eklutna relating to their longstanding efforts to restore salmon passage at the Eklutna Lake dam that would restore access to over two thirds of historic salmon habitat in the Eklutna River system.

The Eklutna River watershed is north of Anchorage and encompasses nearly 174 square miles. The Eklutna River is a tributary to the Knik Arm of Cook Inlet[1]. Please see Figure 1. For nearly 95 years, sockeye salmon migration in the Eklutna River has been blocked as a result of two hydroelectric diversion dams. The first diversion dam, the Lower Eklutna Diversion Dam, was completed in 1929 and

diverted up to 500 cfs of the Eklutna River flow, which benefited the City of Anchorage's electrical need. Please see Figure 2. Since 1929 when the lower dam was completed, the majority of the Eklutna River's sockeye salmon spawning and rearing habitat has been blocked. Additionally, the river flow below the lower dam was greatly attenuated beginning in 1929. Chinook and Coho migration to the upper two thirds of their Eklutna habitat were also blocked.

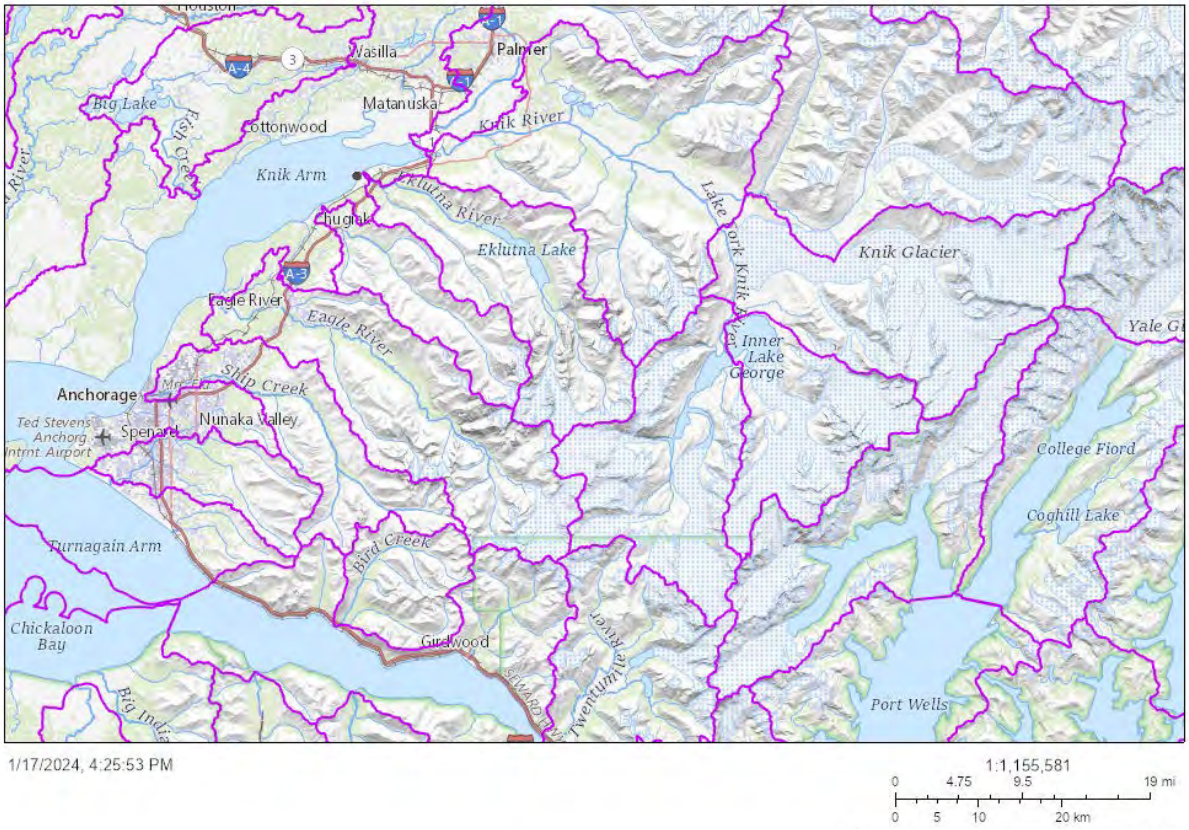

Figure 1. Map of watersheds in the vicinity of Anchorage, Alaska. The Eklutna River watershed is located near the upper center of this map and fully encloses Eklutna Lake, which along with the Eklutna River, are identified on the map. Source: EPA Waters GeoViewer 2.0 web mapping tool.

In 1955, the Eklutna Hydroelectric Project Diversion Dam, the upper dam, was completed considerably further up in the watershed at the outlet of Eklutna Lake, which was formed because of glacial moraine deposition that resulted in a natural dam across the valley[2] (see Figure 2). The upper dam has a considerably larger footprint than the lower dam, which was already blocking salmon migration and greatly diminishing river flow in the river reach below the location of the lower dam. In the nearly 70 years since 1955, most of the mean annual Eklutna River flow, which is estimated at 345 cfs using streamflow gaging data acquired at the Eklutna Lake outlet between 1947 to 1954[1], has been diverted from the river channel below the upper dam. Peak monthly flows of roughly 1,000 cfs occur in July and August[1]. An estimated 90%[1] of water diverted at the upper dam flows into a 4.5-mile tunnel that conveys the water from the lake to a hydroelectric power plant located to the north, on the Knik River, which flows into the Knik Arm of Cook Inlet. The tunnel has a flow capacity of 640 cfs[3]. The power production at the project hydroelectric plant amounts to about 3% of the total power available from the grid, which encompasses Anchorage and outlying areas.

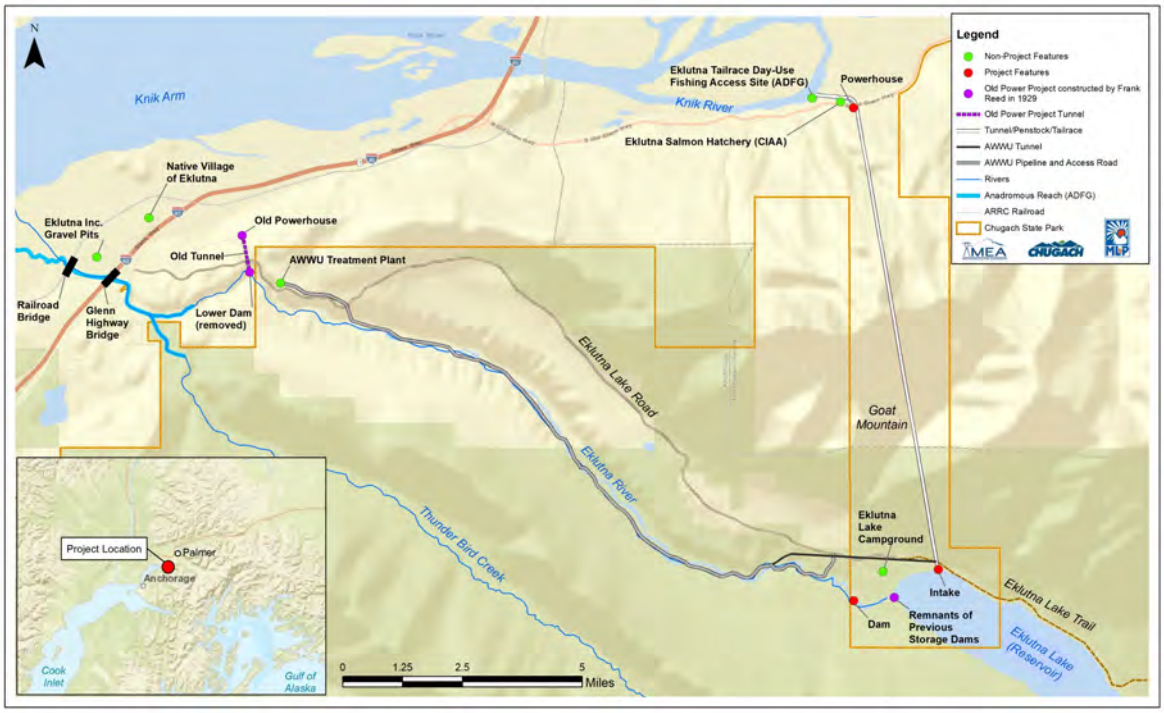

Figure 2. Detail map of the Eklutna River below Eklutna Lake with key dam, diversion, and hydroelectric power generation infrastructure. Source: https://eklutnahydro.com/wp-content/uploads/2019/07/Project_Features_NHD_Tunnel_07-03-2019.pdf

The remaining 10% of Eklutna River inflow to Lake Eklutna is diverted at the upper dam and conveyed via pipeline to the Municipality of Anchorage, supplying roughly 90% of the potable water supply for the Municipality of Anchorage[1].

Thus, since 1955, essentially no flow from Eklutna Lake has been allocated to the 14 miles of river below the Eklutna Hydroelectric River Project Diversion Dam. Note that there was a brief period of river flow during major facility reconstruction in 1965, necessitated by damage resulting from the 1964 Alaska earthquake[1]. In addition, low-frequency, short-duration, high-magnitude flood flows on the Eklutna River are passed by the upper dam spillway when Eklutna Lake has insufficient capacity to store the floods. However, even if sockeye salmon could migrate up the Eklutna River to the top of the upper diversion dam, which is in principle possible after the 2018 removal of the lower dam, there has since 1955 in general been no continuous flow of sufficient magnitude and duration in the Eklutna River to sustain sockeye salmon migration, let alone spawning.

The nearly complete removal of sockeye salmon from the Eklutna River and its watershed has for nearly 95 years, deprived many tribal members and the natural wildlife of the salmon on which they interdepend.

Additionally, it is reported[4] that:

The Eklutna River is a vital subsistence fishery that once supported thriving populations of all five North American Pacific salmon species. While each of these fishes remain present in the lower portions of the Eklutna River, and there are anecdotal reports of landlocked sockeye (kokanee) persisting in Eklutna Lake, today's populations are greatly reduced and limited in distribution.*

*Note: Since the above paragraph was written, reports of Kokanee in Eklutna Lake have been verified[5].

With the above in mind, the National Tribal Water Council wrote this letter specifically in support of the Native Village of Eklutna's (Village of Eklutna/NVE) intention and efforts to accomplish in full the goals of their Eklutna River flow and sockeye, Chinook and Coho salmon restoration, as articulated in NVE Resolution 2022–4; "Łiq'a nagh qinqtudeł - We are hopeful the salmon will return to us." A copy of the resolution is attached.

Subsistence traditions and practices are vital goals of the Eklutna River flow and sockeye salmon restoration. The restoration of sockeye salmon cannot occur without restoration of river flow. The following is an excerpt from the NVE's December 4, 2023, comment letter on the Eklutna Hydroelectric Project's Draft Fish and Wildlife Program.

Our elders tell us that Eklutna (Idlughet) is an old, old village located by the Eklutna River, which was once an abundant salmon system. The Eklutna River (Idluytnu) has provided nutritional and cultural benefits to Eklutna Dena'ina throughout time immemorial, but hydroelectric dams have severely degraded its productivity. NVE has adopted a vision for fully restoring the Eklutna River for fish and wildlife habitat, traditional subsistence uses, and sustainable natural resource development from the top of the watershed to Cook Inlet.[a]

NVE has broad support for this vision. Eklutna Inc. recently remarked that "[c]onnecting Eklutna Lake to Cook Inlet will benefit not just the adjacent landowner but our collective community," including all of Southcentral Alaska.[b] The Alaska Federation of Natives, the largest statewide Native organization in Alaska, passed a resolution in 2020 proclaiming that "[AFN] supports efforts to restore traditional rivers and streams for fish and wildlife habitat, traditional subsistence uses, and sustainable natural resources development, and in particularly, supports tribes like Native Village of Eklutna […] to restore the Eklutna River for salmon habitat." [c]

[a] Native Village of Eklutna, "Our Vision for the Eklutna River" (accessed Jan. 15, 2024) https://static1.squarespace.com/static/5f52cd19995bf84b22653379/t/642742b42454b574f1be304f/1680294580774/.
[b] Eklutna, Inc., Letter to Anchorage Assembly Re: Eklutna Draft Fish and Wildlife Program (Nov. 21, 2023).
[c] Alaska Federation of Natives, Restoration of Traditional Salmon Habitat Resolution 20-7 (2020).

The key elements of NVE Resolution 2022-04 include:
1) Restoration of continuous flows in the Eklutna River below Eklutna Lake sufficient and necessary to support thriving sockeye salmon populations and their passage with intermittent higher

flows that will result in habitat maintenance and recreation opportunities along the Eklutna River between its confluence with the Knik Arm of Cook Inlet and the Eklutna River headwaters above Eklutna Lake; and

2) Management of Eklutna Lake level variability in a manner that facilitates and sustains sockeye spawning in the Eklutna River, from its confluence with the Knik Arm of Cook Inlet to its headwaters above Eklutna Lake. There are published reports of landlocked sockeye salmon living in the Eklutna Lake[5]. These very small, landlocked sockeye salmon are known as kokanee and are likely descendants of Eklutna River sockeye salmon that nearly 70 years ago were isolated in Eklutna Lake and headwaters above the lake, due to the construction and commissioning of the Eklutna Hydroelectric Project. Since they cannot go to the sea, their life cycle nutrition is compromised, and they never grow to mature size, though they do spawn and reproduce.

Given the above situation, brought about by the uncompromising placement of not one but two hydroelectric power and water supply dams on the Eklutna River, the Native Village of Eklutna and its inhabitants have worked since 2000 to restore flows and healthy salmon populations, including sockeye salmon migration and spawning to the Eklutna River.

Recommendations

The National Tribal Water Council ("Council") commends the Village of Eklutna leaders, the Village members, and allied organizations for their efforts to restore Eklutna River flows and sockeye salmon.

The Council recommends that the owners of the Eklutna Hydroelectric Project, which consists of the Chugach Electric Association, Matanuska Electric Association, and the Municipality of Anchorage, work with the Village of Eklutna to craft an Eklutna Hydroelectric Project Fish and Wildlife Program that satisfies the Village's objectives as articulated in the Village of Eklutna Resolution 2022 – 04.

Further, the Council encourages the hydroelectric project owners to work in good faith with the Eklutna Village leaders to manage Eklutna Lake levels and all aspects of the Eklutna Hydroelectric Project, and the Municipality of Anchorage water diversions, in a way that will sustain Eklutna River flows salmon habitat into the future. This will ensure traditional subsistence practices, together with cultural and traditional practices, that rely on Eklutna River flows and thriving salmon populations in the Eklutna River continue indefinitely into the future.

The Council notes that Alaska Natives have suffered a long history of voting rights suppression that continues into the present time (https://www.azcentral.com/in-depth/news/politics/elections/2022/08/23/alaska-voting-rights-history/10238579002/). Thus, it is probable that Alaska Natives in general, and Eklutna Village inhabitants in particular, had no role in decision-making related to the placement and operation of these dams, or the election of representatives responsible for the ultimate approval of such decisions. This history should be taken into consideration when facility owners, agencies, and government representatives negotiate with the Eklutna Village and tribal organization representatives, concerning flow and sockeye salmon restoration for the Eklutna River.

NTWC supports restoring salmon passage at the Eklutna Lake dam that would restore access to over two thirds of historic salmon habitat, by stream miles, in the Eklutna River system. We note findings of abundant potential sockeye spawning habitat around Eklutna Lake, contingent on restoring fish passage at the lake dam and maintaining sufficient lake levels. In addition, NVE habitat assessments found abundant Chinook and Coho habitat in the Eklutna Lake tributaries, which only await restored fish passage to facilitate restored runs. NTWC supports the release of sufficient flows from the lake to restore multiple channels and off-channel habitat for the full length of the Eklutna River below Eklutna Lake.

The installations of the Lower Eklutna Diversion Dam in 1929 and the Eklutna Hydroelectric Project Diversion Dam in 1955, predates the National Environmental Policy Act (1973) whereby all federal projects are required to ensure the review of a proposed project consider environmental impact statements, environmental assessments, and other systematic interdisciplinary considerations. Identifying endangered and threatened species of plants and animals should have been conducted, but these dams were built before environmental review, endangered/threatened species and environmental justice were required. There needs to be a good faith effort to consider the culture and lifeways of salmon on behalf of the Alaskan Native people. Further, there needs to be a good faith effort to address endangered/threatened species and to develop policies that address returning these areas to historic conditions for all species to thrive.

The NTWC appreciates the opportunity to support the Native Village of Eklutna's longstanding efforts in restoring salmon passage at the Eklutna Lake dam that would restore access to over two thirds of historic salmon habitat in the Eklutna River system. Should you have any questions regarding the letter, you may contact me at KenPNorton@gmail.com, or Elaine Wilson, NTWC Project Manager, at Elaine.Wilson@nau.edu.

Sincerely,

Ken Norton, Chair
National Tribal Water Council

From: Meadow Lakes Seniors INC.
To: Sam Owen
Subject: Eklutna Hydro project comments due 2-19-24
Date: Thursday, February 15, 2024 2:10:35 PM

To: Those gathering comments on the Hydro Project,
I attended a Meadow Lakes Community Council meeting last night and left very concerned about the interpretation you will put on their comment. The vote was 11 to send a comment, 7 to not send a comment. The comment was only that the yes votes supported salmon fishing.

This kind of result can be miss-understood. Those in the room definitely wanted to preserve and restore the salmon fisheries. However, they also expressed concern about destroying the MEA power generation and the City of Anchorage water supply.

That is my comment – figure out a way to keep the power generation in place and the water supply for Anchorage intact. Do not tear these down. Maybe some type of fish ladder situation.

I feel the presentation was definitely one sided and did not present enough information for Council members to make a fair decision.

Thank you,
Sherri Rusher

I FEEL it is VERY important for the ecology of the RIVER to be fully restoRed to allow salmon to return to their natural spawning areas. While hydroeLectric power is also necessary, damning should not eradicate the natural Flow of the river and severely impact the anadromous quality of tge Eklutna River.

Dear Owners of The Eklutna Hydroelectric Project,

I am a retired biologist and consultant with long experience in multidisciplinary, complex resource questions. It is rare in my experience that you are within grasp of rolling back an obvious ecological/social wrong of such major dimensions. There will always be appetite for satisfying human “needs”, invariably by invoking “balance”, an equation where the environment always have to retreat.

Don’t we all see that we have come to a point where this has to stop; that when an opportunity like Eklutna comes along to actually tip things back toward nature, this must be done?

Despite the Governor’s sentiments, our emphasis should not always be toward d”developing” Alaska; its golden characteristic is NOT that so much remains to exploit, its that there is so much intactness to cherish - in a world where intactness is vanishingly rare.

Please opt for fish, all species, in the Elkutna system - don’t leave out sockeyes, whose prognosis in the region is good and bids well to make the lake highly productive for this particularly valuable species. This is not only correct on its face, it would also stand as a pivot point, where the boosterism Anchorage has perennially stood for was reversed in favor of the future.

Thank you.
Greg Streveler

RE: Eklutna Hydroelectric Project Draft Fish and Wildlife Program

Dear Steve Padula and team:

The Meadow Lakes Community Council membership voted to support the pursuit of returning salmon to the Eklutna River. The Council membership voted to submit these comments at their February 14, 2024, meeting.

Sincerely,

Camden Yehle

Subject:	Opposed to any reduction in water for Eklutna hydroelectric power generation or Municipal Water Supply
Date:	Tuesday, January 16, 2024 10:16:58 PM

To whom it may concern:
We are opposed to any reduction in water for Eklutna hydroelectric power generation or Municipal Water Supply for the following reasons:
1. The cost of electricity impacts the cost of virtually everything.
2. The cost of electricity is already extremely high in Southcentral Alaska.
3. The Eklutna hydroelectric power plant generates some of the lowest cost energy if not the lowest cost electric energy in Southcentral Alaska.
4. Reducing the amount of water to the Eklutna hydroelectric power generation will only increase the cost of electricity even more which will lead to higher costs for heat, lighting, refrigeration, goods and services, housing and other essentials which will lead to higher population out-migration, higher poverty, higher homelessness and higher taxes.
5. Creating a new fishery is a pipe-dream based upon the dismal salmon returns to the existing Little and Big Susitna River drainages which are unable to reach escapement goals even with sport fishing closures.
6. With the Eklutna River drainage being on mostly, if not all, private land, any fishery is doomed to create more conflict.
7. Reducing the amount of water for the Municipal Water Supply will only increase utility bills which will also lead to higher population out-migration, higher homelessness and higher taxes.

CAUTION: This email was received from an external source

I hear that Anchorage gets 90% of its water from the eklutna lake. I also hear that there is a small amount of fish effected by the existing eklutna hydro water project. why in the world would we risk loosing the water source for the city of anchorage and also risk loosing the inexpensive electric power produced. I don't support any changes to the existing eklutna hydro Dam, period. Leave it as is except for efforts to enhance it current operations.

Please DO NOT take any action that would reduce electrical power, drinking water and access to recreation to tene of thousands of residents in South Central Alaska. We should be expanding these recources .
Thank You.

From:	Gary Brown
To:	Sam Owen
Subject:	Comment on the Eklutna Hydroelectric Project Draft Fish and Wildlife Program
Date:	Tuesday, February 6, 2024 12:21:57 PM

Do not take any action that will jeopardize diminishing or losing almost 90 percent of MOA's water supply. Also, do not take any action that will jeopardize, diminish, or eliminate the production of clean electricity that can provide power to some 24,000 home for an entire year, at the lowest cost of renewable energy in Southcentral Alaska.
The current use of Eklutna Lake is far more valuable and important than the uncertain potential of migrating salmon.

Sincerely,
Gary Brown

Write your comments on the Draft Fish and Wildlife Program here:

The Eklutna Dam should be left alone. It is fiscally irresponsible to spend 40 million dollars of hard-earned taxpayer money on something that is working well. People need energy and water. To spend forty million dollars minimum and get 10% less energy for a few fish is not a good return on our money. It would be criminal to be so reckless with our tax dollars. The Eklutna Dam should be left alone.

aS A 40 YEAR EAGLE RIVER RESIDENT WHO HAS ENJOYED THE BEST WATER IN ALASKA, I HATE TO SEE THESE VARIOUS OPTIONS PUT WATER AVAILABLITY AT RISK. THE RISK COULD BE SUPPLY OR CONTAMINATION. ALL PROPOSALS WILL JEOPARIZE THE SUSTAINABLE pOWER GENERATION AT THE EKLUTNA HYDRO PLANT. ALL WILL COST ADDITIONAL DOLLARS FOR POWER. AT A TIME WHEN WE ARE NATURAL GAS CONSTRAINED THAT DOES NOT MAKE ANY SENSE. WE NEED OUR ELECTRIC POWER AND OUR GOOD DRINKING WATER.
NOW EVERYONE WANTS TO MAKE THIS ABOUT SALMON RETURNING TO LAKE eKLUTNA. i AM SORRY BUT IF YOU LOOK AT THE COSTS OF THE VARIOUS OPTIONS, WE CAN BUY SALMON FROM cOPPER rIVER OR THE KENAI AND DELIVER IT TO THE RESIDENTS OF EKLUTNA FOR EVERY. IT MAKE SO SENSE TO REMOVE THE DAM FOR FISH TO DIE IN THE LAKE.
i HOPE THE GOVERNOR IS SMART ENOUGH TO SEE THIS FOR WHAT IT IS. A BIG WASTE OF MONEY.

Hello,

As a MULTI-GENERATION and lifelong Alaskan, thank you for the opportunity to provide input on the Eklutna Hydroelectric 1991 Fish & Wildlife Agreement study results and proposed project. I fully agree as stewards of the natural resources in this great land we need to wisely manage and use the resources provided to us. Reviewing the proposed alternatives and cost benefit analysis I do not see an alternative which provides benefits that justify the cost or scope proposed. The owner's alternative (as well as the others) does provide for year round flow in the Eklutna River for the spawning and rearing of Coho, Chinook, and Sockeye salmon. However, the alternative's analysis only provides information on the habitat gain's provided by the proposed project, not the anticipated size of the salmon run. The size of the run is an important metric as it will help decision makers and the public better determine the cost and benefit of the proposed alternative. Per study personnel the estimated salmon run achieved by these proposed alternatives is between 200 and 1,000 salmon per year. With a projected annual cost of $2.8 Million this means the cost per salmon will range from $14,000 to $2,800 per salmon. In addition the small run will not be able to provide a sustainable food source. To ensure longevity of the run most salmon must be allowed to spawn and bag limits on the Eklutna river will be very small.

The final cost which does not have an offsetting benefit, is the reduced power production of the Eklutna hydroelectric plant. The Eklutna hydroelectric plant provides clean, reliable, low cost electricity to all railbelt customers. No major maintenance or end of life issues are present at the plant which would limit or reduce its capacity and longevity to provide clean, efficient power. As such, intentionally limiting the operation and reducing capacity of the Eklutna hydroelectric plant only results in inefficiency and reduced performance of the railbelt electrical generation system. This change impacts all railbelt customers and requires increased electrical generation using less efficient and clean power sources.

For the reasons listed above I request that the recommended solution of the 1991 Fish & Wildlife Agreement study to the Governor of Alaska be that the study finds the impacts of the Eklutna Hydroelectric plant have already been realized since construction in 1955 and no further impacts to the environment are imposed. Mitigations and enhancements are found to have an unfavorable cost to benefit ratio. Continued operation of the Eklutna hydroelectric plant, Eklutna dam, and AWWU water source is recommended to continue as is.

Respectfully,
Dennis H.

Hello, dear fellow alaskans,
I URGE ALL OF YOU, WHO ARE CONSIDERING CAHNGEING THE EXISTING WAY THE EKLUTNA POWER PLANT OPERARATES, TO RECONSIDER.
iN AN AGE WHERE EVERYONE IS CALLING FOR CLEAN ENERGY, TO CONSIDER GETTING RID OF A WONDERFULLY WORKING POWER PLANT THAT SUPPLIES ABOUT 6% OF aNCHORAGE'S POWER NEEDS DOES NOT SEEM WISE.
tHE DRINKING WATER IS ALSO AN IMPORTANT FACTOR. AS WE ALL KNOW, WE HAVE HAD SEVERAL YEARS WHERE THE WATER LEVELS HAVE DROPPED CONSIDERABLY. wITH THE CHANGES THAT ARE PROPOSED IT COULD GET WORSE, WHEN WE GET MORE DRY SUMMERS.
tHE NUMBER OF SALMON, THAT WOULD POTENTIALLY BE ABLE TO MAKE IT TO THE LAKE, AND REPRODUCE SEEMS VERY SMALL, IN THE COMPARISON TO THE COST OF THE PROPOSED PLANS.
Per study personnel, the estimated salmon run achieved by these proposed alternatives, is between 200 and 1,000 salmon per year. With a projected annual cost of $2.8 Million this means the cost per salmon will range from $14,000 to $2,800 per salmon. In addition the small run will not be able to provide a sustainable food source. To ensure longevity of the run most salmon must be allowed to spawn and bag limits on the Eklutna river will be very small.
This change impacts all railbelt customers and requires increased electrical generation using less efficient and clean power sources.
Mitigations and enhancements are found to have an unfavorable cost to benefit ratio. Continued operation of the Eklutna hydroelectric plant, Eklutna dam, and AWWU water source is recommended to continue as is.
tHANK YOU FOR CONSIDERING BEING WISE STUARTS OF OUR GREAT LAND AND RESOURCES.

Thank you for allowing our input. I am not intending to write in all Caps, this message box converts texts to all caps :-) I am support of keeping the eklutna power plant as is, with no change. Eklutna Hydroelectric project provided a reliable alternative source or low cost electricity which is essential to reduce the burden and cost or providing electricity to consumers who are already experiencing over whelming costs for energy along with all other necessities. We cannot afford a project that we will pay for. In every area of our lives, we are paying more and reducing resource availability. Right now we need simplicity and stability in our energy and lower costs. Considering that only 200 to 1000 salmon with return makes the argument that this project should not proceed.

Date: Monday, February 19, 2024 11:30:04 PM

The dam should stay as it is. It is insane to remove the hydroelectric generation when we are faced with a natural gas shortage in the future .it would have to be made up by gas generating electricity turbines. How much power did the wind turbines on fire island generate when it was -20 earlier this year. not much i would bet. Enhance salmon somewhere else and leave eklutna river as it is.

B-3. Support Draft Program

I support the current proposal for the eklutna hydro project. The renewal electricity that is produced is very low cost for the consumer in several communities and should be maintained. No other electricity option is this cost effective.
This project also supports the important water source for the Municipality of Anchorage. It should be maintained.
Please move this proposal forward as it currently is.

The owners purposal of spending the 44 mil seems adequet if not excessive. Keeping rates low for members should be the top priority ~~waste~~ then the fish can be a secondary priority. There plan to set up a committee to help mitigate risks to salmon and even fund that comitte seems rather generous and should help to mitigate the issues of the people on the committee. Please focus on these switch on/off hard resources like the Eklutna dam. Renewables are cute and should be pursued only if done so critically and with proven energy providers there to back them up.

I have been following the discussion regarding the plans for the future of the dam and related recreation. I urge the governor to move forward with LEAVING the dam in place PROVIDing cheap, reliable energy . Upgrade the recreation areas and try and allow the native community to develop fishing techniques and alternatives for subsistence.

Hi Charlie,

Thank you for your comment. It has been added to the record and will be taken into consideration by the Project Owners.

That's a great question. We actually did look into this kind of "hybrid" alternative (proposed by The Conservation Fund during the fourth alternatives analysis meeting and discussed during the fifth alternatives analysis meeting). The problem is timing. The salmon start migrating upstream in June when the reservoir is usually still very low. Which means that in order to release water at the dam through a fish ladder in June, we would need to keep the reservoir high through the winter by not generating any power for about 7 months, just like if we were releasing water from the dam year-round.

Hope that helps, and thanks again.

CAUTION: This email was received from an external source

Thank you for the Jan 17 meeting. It was very informative. The utility plan seems to be a good one. My main concerns were our great water supply and green power generation. Would it be possible to install a passage around the dam with a water gate that could be opened as much as needed during the fish run to the lake and again when the smouts go out of the lake ? We may loose a little green power during two say 30 day periods. CHARLIE PETER

Subject: Public Comment: Eklutna Hydro Mitigation Project
Date: Wednesday, January 24, 2024 1:14:35 PM

To whom it may concern,

I am writing to express my support to the Eklutna Hydro Project proposed mitigation efforts to allow great salmon spawning on the Eklutna River. I know there are many challenges associated with the equitable use of this resource; however, I believe the proposed path forward is the best to allow for the most wide cast use of the Eklutna River. As a resident of Anchorage, the drinking water and power the Eklutna Reservoir provides is vital to a continued sustainable life in South Central Alaska. Please have my greatest thanks for the hard work of the project team on developing this mitigation plan.

Thanks,

Aidan I. Blum (He/Him)

I recommend the governor adopt the recommended option put forth in the Eklutna Fish and Wildlife program.

i attendeD THE PRESENTATION ON jAN. 18 IN EAGLE rIVER ONTHE EVALUATION OF THE eKLUTNA HYDRO FISH AND WILDLIFE PROGRAM. tHE PRESENTATION ON THE ALTERNATIVES AND THEIR ASSOCIATED COSTS WAS WELL DONE AND EASY TO UNDERSTAND. aS A BIOLOGIST AND AND ENGINEER HAVING BEEN INVOLVED WITH ENVIRONMENTAL IMPACT STUDIES (eis) AND ENVIRONMENTAL ASSESSMENTS (EA) on the north slope and in cook inlet, i was impressed with the depth and breathe of the studies conducted over five years for the project. I also thought the efforts by the power associations to include the signatories to the 1991 agreement and the native village of eklutna was well done.

If we read the Anchorage daily news, we would be led to believe it was only about removing the earthin dam. They want to make this the politics of salmon. Some believe they can have salmon in eklutna lake just like the kenai lake. wrong. it is not just about that. not just a single solution. it is a well thought out engineering and biological solution.

The idea of turning the lenght of the eklutna river into viable spawning and rearing habitat by controling the flow of water in the river year round is brilliant. The detractors to the preferred option complain about the one mile of the river that will not have controled water flow but that is of little consequence in the overall benefit scheme. removing the dam make the river a wild uninhabitable location for fish through the summer months. Not a good idea. It will also damage the water intake piping to the water treatment plant by scouring the pipe that cross under the river. Additionally, the large water flows in summer months will damage the bridges crossing the river.
Removing the Dam is a damn bad idea.

lastly, it is important to understand that the eklutna lake is not good salmon habitat. The lake is glacier fed and brings consideral silt into the lake. The silt covers the gravels good for attaching the salmon eggs and rearing young fish. The several fish species in the lake today are undersized and malnurished due to the silt. creating and expectation that removal of the dam will allow sockey salmon to be raised in the lake is bad science.

We need to continue to have the cheapest and most reliable power in southcentral AK. we cannot put our families and communities at risk over the politics of salmon. Please support the comprehensive proposal by the power companies and their experts on the eklutna fish and wildlife program.

I am IN favor of the plan as submitted for public review.
I attended a public information session and had ample opportunity to ask questions of the principal researchers.
This project has more impact on anchorage's water source than it does as a power source.
I noted that there were no firm commitments by trout unlimited and other associated groups to contribute to the maintenance/repair of the water pipeline should the free-running river damage the line.
I do strongly agree that other more eco-friendly sources of energy are needed and should be developed. However, I give protecting MOA's source of potable water a higher prority than a restored streambed.
"A good compromise leaves everone unhappy", this plan has succeeded.

To whom it may concern,

I am writing in support of the clean energy produced by the Eklutna Hyroelectric Project. It is my understanding that this is some of the most inexpensive and cleanest energy produced in South-central Alaska. As a member of the MEA and a Palmer resident I would like to see the project continue to produce as much electricity as possible. This is an energy resource that is shared and used by residents throughout south-central and is a benefit to all residents who use electricity.
From attendance at the Palmer informational meeting it sounds like the “portal” option may be a good option. I support any option that continues to produce energy at the current rate or is an improvement on the current energy production without incurring additional costs to the utilities or their members.

Sincerely,
Andrew Spohn
Palmer, Resident

I support the Project Owners plan to continue to use the Eklutna Hydroelectric power plant. Currently there are very few alternatives to replace this power source. Natural gas, the area's primary source to produce power is currently in decline in Cook Inlet. Matanauska Electric Association proposed building a coal-fired power plant and the community rejected it. The use of solar and wind during the cold Alaskan winters is an unreliable source of power. Until a safe, clean and abundant source of power is available the dam needs to be left in place.

Date: Saturday, January 27, 2024 3:22:05 AM

Hi! I'm an anchorage resident that has spent some time at Eklutna, and benefits, like everyone, from hydroelectric power in Alaska!

I read the draft for restoring the Eklutna river while maintaining production capacity of Eklutna Hydro, and really support that initiative. I think it sounds really smart to redevelop that salmon habitat, and I appreciate the desire to keep effective green energy production.

My only hope is that one day the salmon habitat can extend all the way into Eklutna lake while maintaining electricity production, but I understand the limitations. Thanks for doing this!

Thanks,
Gus Schumacher

I am against the removal of the dam, for many reasons. The threat to Anchorage water supply, the infrastructure of the glen highway and the bridges over the Knik. My main concern is the loss of the cheapest and most reliable source of electricity for the railbelt, with the possibility of a natural gas shortage looming and general expense and lack of reliability of other forms of renewable energy sources not being anywhere close to that provided by the dam. Iam concerned about steeply rising costs of electricity and its availability in general. Iam a lifelong Alaskan and an avid outdoorsman, I love salmon and all that they provide for our communities. I consider myself a conservationist and have been excited to see the progress made so far on the Eklutna river but I believe that the plan presented for restoring a majority of the river without the removal of the dam to be the best option. If you have any questions about my opinions please feel free to contact me.

I do not agree with removing the dam,but am 100% for any efforts to mitigate the risk to fish and wildlife.

getting rid of some of the lowest cost electricity is not wise.
Cook inlet is running out of natural gas without any replacement in sight, thus putting more use on natural gas, a fossil fuel.

multiple natural gas rigs are currently broken thus stressing the system.

Alaska needs diversified power generation, hydroelectric should continue to be apart of that.

I live in Anchorage. I understand that the Eklutna Dam PROVIDES 90% of Anchorage's drinking water and also provides electricity to Anchorage. I understand that Chugach Electric has proposed an alternative Plan on how to provide water to the Eklutna River for returning salmon and to also keep drinking water flowing to Anchorage. Stick with Chugach Electric's plan. Keep the dam working. Do not tear it down.

Date:	Friday, February 2, 2024 2:43:25 PM

I attended the January 18 public meeting, read the 1991 Agreement, and reviewed the documents at eklutnahydro.com.

My focus is on the requirement of the 1991 Agreement ". . . to ensure that Eklutna and Snettisham are best adapted for power generation and other public uses . . ." The greatest public benefit is for continued power generation and water supply, which benefit all residents of the area. Affordable and reliable utilities are essential to the local economy and quality of life. Although some people are calling for the restoration of sockeye, "the protection, mitigation of damage to, and enhancement of fish and wildlife (including related spawning grounds and habitat)" is just one of eight purposes to be given equal consideration in the Fish and Wildlife Program.

The project owners' proposed program both improves the utility infrastructure and enhances fish habitat at a reasonable cost. As both an MEA customer and an Anchorage taxpayer, I care about project cost. It is easy for those who are neither ratepayers nor taxpayers to propose idealized projects at no cost to themselves.

I believe the owners' proposal fully meets the requirements of the 1991 Agreement, and encourage Governor Dunleavy to approve it.

Subject: Request to support the 2023 Eklutna Draft Fish and Wildlife Program
Date: Saturday, February 3, 2024 9:25:26 AM

February 3, 2024

Governor Dunleavy
c/o Samantha Owen
McMillen Jacobs
info@eklutnahydro.com

Dear Honorable Governor Dunleavy,

Please support the October 27, 2023 Eklutna Draft Fish and Wildlife Program (Draft). It will benefit all parties and is a good compromise that supports the 1991 agreement, red salmon, the Anchorage water supply and hydroelectric power.

The 1991 Agreement requires a Final Fish and Wildlife Program be issued by the Governor by October 2, 2024. The work to date has thoroughly studied the issues and produced a Draft you can sign as Governor. The Draft is well supported with documents, studies and agency reviews. I have reviewed the materials on the eklutnahydro.com website. I attended the Eklutna Hydro Public Meeting on January 17th and listened to and asked many questions of the technical experts. I support the Draft, a release of water from a new Eklutna River Release Facility, and to not remove the Eklutna Dam.

Removing the dam will not guarantee red salmon will travel past the old dam site and rear in the then river accessible Eklutna Lake. I have seen several places in Prince William Sound where post 1964 earthquake fish improvements have failed to reestablish red salmon runs. The Draft supports releasing 40 cfs of water in the summer to assist silver and king salmon. This additional water released from Eklutna Lake combined with Thunderbird Creek water will improve habitat for silver and king salmon as shown scientifically. Supporting salmon habitat is good. Removing the dam with the hope of red salmon rearing is not worth the loss of the dam's attributes.

Anchorage's water supply is crucially dependent on Eklutna Lake supplying the bulk of Anchorage's drinking water. Removal of the Eklutna Dam will allow uncontrolled flood events which may be detrimental to the water supply pipe. A lower Eklutna Lake water level puts the Anchorage water supply at risk.

Hydroelectric power is a valuable, reliable and affordable form of renewable energy. It is not dependent on the wind blowing or the sun shining. We can protect our energy security by continuing to use the Eklutna hydroelectric plant. Removing the dam will eliminate a nonpolluting source of power and is the wrong thing to do as Alaska is suffering from high energy prices.

The 1991 Agreement calls for periodic analysis (every 25 years) of the Eklutna hydroelectric developments on fish and wildlife. In the year 2049 let the analysis be done again for fish and wildlife. The Draft you have for your approval is a good compromise. The Draft will improve fish habitat, maintain Anchorage's water supply and provide reliable energy for Alaska.

Sincerely,

Mark Parmelee

I am a resident of Anchorage, a property owner, and a business owner. I strongly support full comp-liance with the 1991 Fish & Wildlife agreement for Eklutna Dam and strongly feel the Owners has completed fully sufficient studies and analysis of alternatives. The Owners' alternative to install a portal valve is reasonable and represents the best option for mitigating stream flow while balancing the need to maintain a VIABLE drinking water source and provide low cost and clean electricity for our community. The 1991 Agreement never contemplated removal of the dam and this arbritrary demand is being pushed by the activist industrial complex that generally opposes all human activity across the U.S. I urge you to complete the process in compliance with the 1991 Fish & Wildlife Agreement and not deviate from the timeline contained therein.

Subject: Dam
Date: Thursday, February 15, 2024 11:17:58 PM

I do not believe that removing this dam is a good idea. We get so much electricity currently!! It's good, clean energy. There would not be enough salmon to make a difference. It would be a huge waste of time and money. Chugach can bring some water back a mile down stream. Sounds like a good compromise to me.
Please don't take the dam out!

I appreciate efforts to minimize affects on the environment including sustaining marine species like salmon. I believe the Owners' plan is sufficient to meet their agreement obligations to do this without unacceptable major production losses or cost impacts to a necessary source of renewable energy and the main water supply to a significant portion of the state's residents. Removing the dam and spending hundreds of millions of dollars will not guarantee salmon will return to an area they may have frequented for more than 100 years ago, especially considering how salmon populations throughout the Pacific Ocean and anadromous waters are currently depleted.

Date:	Saturday, February 17, 2024 11:55:16 AM

Hello,
I am in support of any solution or infrastructure build out that would minimize impacts to the existing electric generation and water supply for Anchorage.
my reasoning is that for close to 100 years (i.e. multiple human generations) the location has been adapted to act as a minor recreation site as well as function as a core piece of infrastructure for roughly 40% of the state.
More importantly, that major 40% of the state is also facing a looming energy crisis with natural gas shortages on the near horizon. The main solutions to that crisis have been a push for renewable energy; which eklutna hydro is. To remove a major source of reliable, clean energy in the face of a natural gas shortage would be economically, environmentally, and logistically irresponsible.
Thank you,
Dan Smith

---

I believe the Eklutna Dam is a valuable source of green energy, sustainable energy and common sense energy.
To destroy one of the primary sources of drinking water seems fool hardy.
I have seen no hard evidence that a “Kenai River salmon flow “ would be achieved.
Penalizing a large population for a small population seems poorly thought out.
Use the proposed mitigation programs and go from there.

Please don't do It!
tearing down an ENTIRE dam for approximately 2,000 salmon for subsistence in Eleven (11) miles of the Eklutna river is not based on common sense. First, restoration is not part of this project. Second, will the fish go up the river? Know one seems to know. \\\"Fish will do what fish will do\\\" is the answer I keep hearing. Thirdly, have any studies been done since the lower dam was torn down? Finally, at what cost?
Next consider water and energy for the Anchorage area. Ten (10) percent of our water comes from the dam. I heard the replacement from renewable resources would take approximately ten (10) plus years to obtain our current level. and that still leaves no room for future GROWTH; FOR Anchorage, the mat-su area which will affect the entire state. If the dam is torn down there will be no water pressure in the fire hydrants from eklutna to eagle river. in a hot dry summer everyone worries about a out-of-control devasting forest fire. this would be a perfect opportunity.
As to providing energy for the area, what emergency plans are in place when the temperatures dip into the negatives for days at a time which recently happened? does anyone really want to make those DECISIONS BECAUSE renewables are not available.
What costs are involed with this project? The TAXPAYERS will see huge increases in the tax bills and energy bills. What will be the cost or REPLACING THE infrastructures to the taxpayer and the state? I, also heard, discussion on building a new dam. Millions more dollars for tearing down a perfectly good dam. What are all the unforseen costs? Costs
never go down.
Please follow the eight (8) directives that are address and leave the dam in place. My common sense says this is ridiculous and maybe 35 years from now there will be an entirely different energy source besides windmills and solar panels. Hydro electric is a clean and reliable sourece.
Thank you for allowing my voice to be heard concerning this project.

RE Alaska's Constitution Requires a Balanced Solution
Ref# Eklutna Hydroelectric Project: Draft Fish and Wildlife Program

To all concerned,

I support the solution outlined in Eklutna Hydroelectric Project - Draft Fish and Wildlife Program in Section 5 on page 76: **Summary of Draft Fish and Wildlife Program and Rationale**

At a recent public meeting the discussion became polarized by the binary choice of leaving the Eklutna Dam untouched or removal of the dam to restore the original habitat.

Alaska's constitution requires a balanced solution so that the needs of the public's resources for power, water, and fish habitat are met.

Currently dams are being removed in the lower 48. But that will not necessarily improve salmon reproductivity. A major component of the impact on the salmon population is increased predation in Alaskan waters and bycatch.

The loss of salmon habitat due the construction of the Eklutna dam was a mistake not in keeping with Alaska's constitutional requirement of balanced resource management.

On page 76, Section 5: Summary of Draft Fish and Wildlife Program and Rationale, appears to be a balanced solution to the problem for the following reasons.

- The lake is recharged every spring by the glaciers. Climate fluctuations could result in reduced lake capacity for one or more seasons.
- Fish passage to Eklutna Lake will not necessarily provide an increase in spanning area. Salom can only spawn in a lake if there is sufficient upwelling.
- Most renewable energy is not a viable solution to replace the dam. Solar and wind require a way to store energy, so that supply to the grid is consistent. Solar is becoming more efficient, but there is still the problem of Alaska's harsh weather and lack of light during the winter. Wind turbines are designed to shut down when it reaches 22 below.
- MEA must maintain its profit margins if it is going to develop a renewable energy source such as tidal.

The plan as outlined in Section 5 on page 76 has the best chance of success.

Restoring 11 miles of fish habit will also boost Alaska's recreational opportunities and economy.

Subject:	Eklutna Hydroelectric Project Draft Fish and Wildlife Program Report October 2023
Date:	Monday, February 19, 2024 4:56:00 PM

A public comment on this report.

Hello,
I thoroughly reviewed this 209 page report. The analysis was thorough, thoughtful, and well written. Kudos to all those involved is this effort. The $44 million recommended option in Figure 2-1 wins. I agree with that conclusion and support the analysis that resulted in that study recommendation. Keep the Eklutna dam but allow a 10% reduction in water use for hydropower to keep the river flowing now that the lower dam is gone.

$47 million was recently spent to increase the Bradley Lake Hydro project via the Battle Creek Diversion Project. Now the $400+ million Dixon Diversion Project is being studied and likely will move forward. Why? Because hydropower is so dependable for our local needs. It would be extremely irresponsible to remove the Eklutna Dam while we are spending these large sums to add to our reliable hydropower. Very expensive LNG imports are in the future for Cook Inlet. That will be for home heating and electric power generation. Hydropower is cheaper and more reliable than electric power derived from LNG fuel, especially if the Eklutna Dam already exists!

There is a great deal of emotion being expressed by many who have commented on this Report. The days of the Cook Inlet region that existed 125 years ago are long gone. We now have a major civilization here in Cook Inlet. That requires a great deal of affordable/reliable energy to maintain. Civilization impacts the local environment. That is an inescapable fact. We can never “restore” this area to what it was. Now that civilization is here to stay in Cook Inlet we must provide it with affordable and reliable power. If not then we can plan of years of civilization decline in the local area.

Subject: Eklutna Clean Water and Electricity
Date: Monday, February 19, 2024 3:36:04 PM

I have reviewed the positions of various parties regarding the Eklutna Water and Power project currently serving the Railbelt and Anchorage with clean water and renewable power. The utilities proposal to rewater several miles of the river is a practical and sufficient mitigation for improving habitat for several salmon species.

The importance of the dam to store water for public water supply and clean renewable electricity to hundreds thousands of people outweighs the destruction of the dam to admit red salmon to the same watershed. Four other species of salmon will likely be enhanced by modifying releases below the existing dam. This does not harm the water supply or energy production as much as destroying the means of water storage and is a reasonable measure.

Brent Petrie
Sent from my iPhone

MUNICIPALITY OF ANCHORAGE
MAYOR DAVE BRONSON

OFFICE OF THE MAYOR

February 19, 2024

Dear Eklutna Hydroelectric Project Owners,

I write to express support for the draft Fish and Wildlife Program and the inclusion of the AWWU Portal Valve alternative.

Given the critical importance of Eklutna Lake as our municipality's primary source of clean water, safeguarding its integrity and the integrity of AWWU water treatment infrastructure is vital. Preserving AWWU's rights and interests in the Eklutna lake and river system is of key importance. The 1984 Agreement requires the Owners to take no action which degrades the quality of Eklutna Lake as a drinking water source and the 1991 Agreement requires the consideration of municipal water supplies. I am pleased with the robust efforts undertaken by the project owners to ensure that the Fish and Wildlife Program prioritizes the protection of our drinking water. The Owners have coordinated heavily with AWWU to protect and account for the need for drinking water throughout the alternative evaluation process. Furthermore, these collaborative endeavors assessed infrastructure improvements and explored multiple viable solutions through the alternative analysis process. I believe the draft Fish and Wildlife Program will result in even stronger protections for AWWU and improved drinking water safety for all of Anchorage.

The significance of the Eklutna Hydro Dam to energy security cannot be overstated. It plays a pivotal, if understated, role in supplying energy reliability to consumers in southcentral Alaska. The recent cold snap in late January/early February highlighted this crucial role when available gas supply in the region was challenged. At the request of ENSTAR, Chugach and MEA adjusted operations at the Project to increase hydroelectric generation and decrease consumption of natural gas. These efforts avoided a switch to diesel fuel power generation and preserved ENSTAR's gas for other consumers. The timely hydroelectric utilization provided clean, storable, and dispatchable green energy instead of a switch to less sustainable and greenhouse gas emitting alternatives. Without the Eklutna Hydroelectric Project operating in the current configuration, such a switch and savings likely would not be possible. In light of the ongoing challenges to Southcentral's energy security, it is imperative that we preserve and optimize every available energy supply especially one as reliable, green, and cost effective as the Eklutna Hydroelectric Project.

I also wish to commend the Hydro Owner's adherence to the process outlined in the 1991 Agreement. For the last several years, the Owners have coordinated and cooperated with various stakeholders and interested parties, including the various state and Federal resource agency signatories to the 1991 Agreement and the Native Village of Eklutna. I know this is only a draft plan and that public comment and discussion are ongoing but I

believe the current draft holds great promise. The expected further revisions will only enhance and build upon the great work already accomplished. Despite expressions of impatience or desires to value singular interests over the whole, the Owners have progressed through the process diligently and conscientiously listening to and engaging with a variety of perspectives and alternative approaches to achieve the goals "to, protect, mitigate damages to, and enhance fish and wildlife". I trust that this will continue to serve as a robust framework for the remainder of the current process and will again be effective into the future when the process repeats every 35 years.

I appreciate the unwavering commitment to the well-being of the entirety of our community expressed in the draft Fish and Wildlife Program and look forward to the final version and the decision of the governor. Thank you to the Hydro Owners, the Native Village of Eklutna, AWWU, and the various stakeholders and members of the public who have participated and commented throughout this process.

Sincerely,

Mayor Dave Bronson
Municipality of Anchorage

From: P Doty

Subject: Eklutna dam
Date: Monday, February 19, 2024 11:32:56 PM

Iive in Anchorage and support the owners version for the Eklutna dam. The assembly is Not representing my interests and the Eklutna dam should Not be removed. Removing the dam is short sighted, does not consider all the consequences of removal and will harm the residents in Anchorage, take away a large portion of the water and electricity with no feasible, viable, less expensive and less environmentally harmful alternative. It will further adversely impact the already failing city and it's residents and businesses, their economic, water, and electricity, make it even more expensive to try to live here, pay your living expenses, reduce property values, opportunitites all in the false and erroneous belief of helping the environment. The solar, wind, other alternatives are just as or more harmful to the environment if you look at the total picture of prohibitive costs, how well they work, rare earth minerals, what happens to their components when they breakdown, etc. The several hundred thousand innocent residents of Anchorage should not be forced to bear the excessive costs, have their cost of living, living expenses, water, and electricity and lives adversely impacted by removal of the Eklutna dam or any major alteration of the dam. Anchorage residents should not be discriminated against and treated as second class citizens or told to go find some other source for water and electricity.

Subject: Eklutna Draft Plan

The recent media attention regarding the relicensing of the Eklutna Hydro Project prompted me to read more about this source of renewable energy.

The Draft Fish and Wildlife Program document is impressive in the magnitude of planning and study that went into its creation starting back in 2019.
The 8 points the Governor must consider listed in the 1991 Agreement seemed to guide the process and were addressed.

After reviewing the Draft Program it is evident that it was a long and well thought out process. Inclusion of many interested parties is evident in documents created throughout the lengthy project.

The Eklutna Hydro Project website is informative, detailed and impressive.
Any question I had was answered here. I would encourage any interested party to explore all the information offered.

Ultimately, I believe the southcentral community will be better off with keeping the Eklutna project and dam intac**t.** It is apparent the utility owners have written the Draft Program with thoughtful research based consideration guiding their proposal for returning water to the Eklutna River and creation of fish habitat.

At this late point in the relicensing process dam removal and eliminating a renewable energy source doesn't seem like a prudent or fiscally responsible option for rate payers.

Patricia Randlett

Member of CEA and MEA

I would also anticipate that interested groups would continue their endeavors to remove and replace the dam with renewable energy sources. I would hope that this would be accomplished by keeping the utility rate payers whole through finding alternative funding sources to accomplish this undertaking.

CAUTION: This email was received from an external source

the utilities don't really care what you think: they've got the governor in their pocket.

this whole process has been a sham. the utilities have colluded with the alaska energy authority, the city administration, and the commissioners of DNR and ADFG to rig this process.

why? because eklutna hydro is a cash cow that produces $19 million in revenue every year. consider that the utilities bought the hydroproject from the feds in 1997 for $6.7 million.

from the beginning the utilities have ducked and dodged their responsiblity to fix the broken eklutna river. the hydroproject dried up the eklutna river for the past 69 years. see for yourself. walk the river below eklutna lake. its dry or mostly dry for 8 miles.

how do the utilities propose to mitigate for 69 years of damage? they want to put a spigot in the AWWU (anchorage water and wastewater) pipeline and allow a trickle (~10% of normal flows) of water to enter the river one mile below eklutna lake. IF THE UTILITIES GET AWAY WITH THIS, THEY GET TO KEEP THEIR EKLUTNA CASH REGISTER FOR ANOTHER 35 YEARS.

the original problem that got us here was "the loss of a sockeye salmon run.' news flash: sockeye salmon spawn in lakes, and they can't walk the final mile to get to eklutna lake.

don't you wanna have a sockeye run that doesn't mean driving to kenai or chitina? eklutna could be that place, but only if we tell the utilities to get lost. and don't believe anyone who says there won't be any public fishing access - there already is public access to eklutna lake and the upper eklutna river.

if you live on city water, as i do, you should be concerned about the utilities' plan to use the AWWU pipeline to create a dead-end river. the awwu guys have a lot of issues with that plan, and worry it might jeopardize the reliability of a system that supplies 90% of anchorage's drinking water. but they've been told to sit down and shut up by the guy who signs their paycheck.

there is no end to the corruption at eklutna. the people running this show have distorted the data, misrepresented facts to the public and elected officials, denigrated the eklutna dena'ina, and ignored the advice of the state and federal biologists. at the public meetings, where the public should have the opportunity to "testify" as the 1991 agreement requires, you can tell it to an ipad.

there are 6 parties to the 1991 fish and wildlife agreement (7 if you include the native village of eklutna), and 5 of them do not support the proposed alternative. the us fish and wildlife service, the national marine fisheries service, the municipality of anchorage and the native village of eklutna are opposed to the plan. only chugach electric and matanuska electric support their own plan.

don't join them. don't let them raise your rates, raise your taxes, mess with your drinking water, and keep you from catching fish.

Audio Recording Transcription of Chennery Fife

January 16, 2024, 2:00-4:00pm, Palmer Community Center (Depot), Palmer AK

"*My name is Chennery Fife. I live in Anchorage. And I would like to tell the utilities that I don't think this plan is up to the task of what the 1991 Agreement said by not providing fish passage, by leaving a mile of the river dry, and by releasing only 40 CFS in the summer, it will not mitigate the harm done to fish and wildlife and will not make up for the harm done to the Native Village of Eklutna.*"

Re: comments on Eklutna Mitigation Plans

If you're like me, you always strive to do a good job, and welcome and value ways to improve draft work that a wider perspective brings in.

It is in that spirit that I speak to the current mitigation plan.

We live in a world constantly notified of another habitat lost, another species extinct, another culture & its wisdom shoved aside, another beautiful place destroyed. With this project, we Alaskans have an exciting opportunity to reverse degradation, bring back our salmon, and create a win-win future with restoration.

<u>Rather than the current mitigation plan</u>

- Dam removal or dam modification that does not allow salmon to do their migration or return upriver, due to a mile of dry bed,
- Restricts water flow way below minimum needs for a stream ecosystem & healthy salmon
- Costs more than it benefits
- Puts low quality water into the habitat from the AWWU

<u>I urge you to develop the alternatives and remedy some weak points.</u> That is, build features that:

- Restores the Eklutna River to flow naturally out of Eklutna Lake.
- Reverses 100 years of cultural and environmental neglect.
- Allows for the recovery of salmon, by re-connecting the river to the lake, opening up 65% of their available habitat in Eklutna Lake and its upstream tributaries
- Saves utility ratepayers and MOA taxpayers from rate and property tax hikes to pay for a $57 million for a plan with few benefits.
- Provides time to transition to new renewable energy projects.
- Does not jeopardize the Anchorage drinking water system.
- Protects popular lakeside trails from erosion caused by fluctuating lake levels.

We will be watching and cheering you on as you revise your drafts and revitalize a treasured area.

Thank you

The Draft Fish & Wildlife Program is a failure. It fails to mitigate the harm done to sockeye salmon - the reason for the draft program. The Project Owners are breaking their legal obligations and taking the position of the Eklutna People for granted. This process tells one story and expects the public to comment in private, preventing a conversation from occurring and all of the facts to be laid out.

1. I oppose half-measures. The 1-mile dry proposal is a short-term expedient with long-term consequences. It will be seen as a costly mistake. Rip the bandaid off (work to remove the dam etc) and adjust to the consequences.

2. In concept the Eklutna/Trout Unlimited proposal to remove the dam without public investment is one I favor - but I have questions - what does it mean 'replace' the power from the hydro project?

3. I did not see any forecasting of natural lake levels under different climate change scenarios.

I Trust that the Fish & Wildlife Plan, proposed for The EKLUTNA River, will be to "By ALL Means" include a long-term Vision of meeting the Needs of the SALMON, the EKLUTNA Peoples, and be According to the Legal Obligation, to Mitigate Dam projects' IMPACT on our Fish and Wildlife. So

* Releasing only 3% or so of the Historic River Flows will Not provide enough Fish passage and restore the River's Salmon.

I think any decision should PRIORITIZE Restoring the River's Salmon AS Soon as possible.

Audio Recording Transcription of Aaron Leggett

January 17, 2024, 6:00-8:00pm, Arctic Center, Anchorage AK

"*My name is Aaron Leggett, I live in Anchorage. I have the honor of being the President of the Native Village of Eklutna for the past almost six years. I've been on the Council since 2007. I'm submitting my comments today on the Eklutna hydro project. I've been intimately involved with every aspect of it, from the lower dam removal to where we are today. And overall, I want to say that I'm a bit disappointed in the way that the overall process has went. I continue to remain optimistic. I believe that what's currently being proposed by the utilities is inadequate, and I hold out hope that we can come to a more reasonable compromise that doesn't put so much burden on the Native Village of Eklutna and fish passage. I believe that by rehabilitating the Eklutna River and putting another major salmon-producing stream for all five species, again, all five, in Upper Cook Inlet, will not only benefit the Native Village of Eklutna, but it will benefit all residents in South Central Alaska. I'm sensitive to the fact that the utilities are beholden to their ratepayers and also to their commitments with renewable energy as they move forward. That being said, I do believe that we can find a more equitable compromise. And I believe that most Alaskan residents, especially those within the municipality of Anchorage, value salmon habitat and salmon restoration. And I don't think the utilities are looking at the overall impact that a more fully restored river will have, not only on the flora and fauna of the area, but other economic benefits that might incentivize some of the landholders, like Eklutna Inc. and others, to want to develop recreational opportunities as well as new housing opportunities, which then would increase taxpayers and ratepayers and would lead to a growth in Anchorage. I was born here in Anchorage, lived here my entire life. And in the last few years, for the first time in decades, we're seeing an outmigration from our area. And you have to wonder, why are we seeing an outmigration from our area? How do we, as good community partners, come together, work on a solution that's long term, that's based not just in the next 5 or 10 years, but looks at the next 100 years of our community. And I believe that having a healthy, more completely restored, Eklutna River fits into that overall goal. Thank you.*"

From:	Scott Hayden
To:	Sam Owen
Subject:	I support the Community Alternative
Date:	Wednesday, January 17, 2024 10:12:46 AM

Restoration of the Eklutna river is important to Alaskans, the people of Eklutna, and anglers in southcentral Alaska.

I do not like the alternative that pipes water for a mile before returning it to the river. This is an expensive partial solution.
The community alternative restores the whole river, restores the areas upstream of the lake, and does it at no cost to Anchorage ratepayers.

My only issue with this plan is that it does away with clean electricity for Anchorage. I would like to include a plan to pay for additional green energy included in this alternative.

Sincerely,
Scott Hayden

CAUTION: This email was received from an external source

The Draft Fish and Wildlife Program is based on a false premise.

Page 44 of the Draft says "As required by the 1991 Agreement, the Draft Program gives equal consideration to the purposes of:

1. Efficient and economical power production
2. Energy conservation
3. The protection, mitigation of damages to, and enhancement of fish and wildlife (including related spawning grounds and habitat).
4. The protection of recreational opportunities
5. Municipal water supplies
6. The protection of other aspects of environmental quality
7. Other beneficial public uses
8. Other requirements of State Law.

This is not what the 1991 Agreement says. The Agreement says that "the Governor shall (not "must" as the Draft says on page 2) give equal consideration to" the terms listed above.

It is inappropriate for the Project Owners to give equal consideration to these terms. That is for the Governor. The sole purpose of the 1991 Agreement is the protection, mitigation of damages to, and enhancement of fish and wildlife (including related spawning grounds and habitat.)

Date: Friday, January 19, 2024 4:24:56 PM

Good afternoon,

I would like to submit a comment on the Eklutna dam restoration project draft proposal. As a Chugach Electric & AWWU user and resident of Anchorage, I appreciated the presentation at Arctic Rec Center the other day. I was struck by the brief reasoning given for why the "project owners" did not support the Eklutna tribe's stated directive to eventually restore the river to its original water flow. All the financial considerations aside, the right thing to do for equity and for wise practices for living on Earth is to listen to the Indigenous people whose lands have been sacrificed for our (often wasteful) use of power and water.

One way the loss of this power could be mitigated is to lead a real city-wide effort to eliminate wasting electricity, at the very least. That could easily bring down the need for that 3% of electricity that the hydro plant currently provides our municipality.

One other thing I'd like to point out is that in the cultural resources inventory, instead of saying there were no pre-contact cultural resources found in the area, which upon questioning is not entirely true, it should be simply stated that there were findings of cultural significance in the area but that they were kept confidential due to cultural sensitivity. It is worth acknowledging the truth as it is.

Respectfully,
Sara Thomas

Hello, my name is Heidi Frost. As a member of Chugach Electric, I would like to express my concern about the proposed plan. It appears that the proposal puts the environmental impacts and the needs of the Native Village of Eklutna behind the wants of MEA and CEA members. This is not acceptable as we need to live up to our obligations and the promises made over 30 years ago.

It is crucial to remember that all parties agreed on what needed to be done, and it is not fair to renege on the promises made. The current proposal does not live up to the intent of the signed agreement, and we need to ensure that we fulfill our commitments, even if it negatively impacts the members of MEA/CEA.

Moreover, the proposal raises concerns about the negative impact it could have on AAWU and our drinking water. It seems that some responsibilities are being pushed off onto another utility, which is not fair or equitable.

Finally, the proposed plan will cost $57 million and will only free up a small portion of Eklutna River, failing to restore the salmon to the river as promised. It is selfish to move forward with this plan and ask Alaskan Natives to put aside the promises made and acquiesce for the 'greater good.'

We need to reconsider this proposal, live up to the promises made, and stop making others pay for our energy consumption needs. This idea couldn't have been made with all the players in the room. It's great for MEA/CEA, but terrible for the Native Village of Eklutna and its residents, the fish and wildlife of the area, and potentially the residents of Anchorage if the drinking water is impacted.

Thank you.

Dear Owners of The Eklutna Hydroelectric Project,

When the Eklutna dam and hydro project was built we did not consider things like loss of salmon habitat. Now is an opportunity to rectify our past oversight. The project should be reconfigured so that salmon have full access to the full run of the Eklutna River as well as full access to the Eklutna Lake and its tributaries. Some water could still be used for hydroelectric power production and some could still be used for municipal water consumption, but the full river and lake should be available for fish as well.
Thank you for your consideration.

Sincerely,
Richard Anderson

Subject: Eklutna River plan
Date: Monday, February 5, 2024 10:57:27 PM

The plan recently released by the utility companies falls far short of what was envisioned in the transfer of the Eklutna power project in requiring an abatement plan for the adverse impacts caused by the damming of the Eklutna River. The plan which would leave a mile of the upper river dry below the lake dam doesn't come close to addressing the need for the restoration of the historic salmon resources of the river and the lake.
Most recently the Anchorage Assembly has called for a halt to this plan and much more thorough and comprehensive study of the impacts on municipal drinking water, the fishery, all viable options, and other issues. In light of the apparent self-serving analysis by the utility companies, this seems like a prudent approach at this point. While the lake provides power and water to our community, there are other valuable resources inherent in a free-flowing river that merit full consideration and protection.

Thank you for the opportunity to comment on the Eklutna Hydroelectric Project Draft Fish and Wildlife Program (Program). This Program is a requirement of the 1991 Fish and Wildlife Agreement Snettisham and Eklutna Projects to "Develop and implement measures to protect, mitigate damages to, and enhance fish and wildlife (including related to spawning grounds and habitat)".

Project owner proposed winter instream flows of 27 cubic feet per second (cfs) and summer flows of 40 cfs are inadequate and do not fulfil the requirement of the 1991 agreement. This has been clearly pointed out in written responses from USFWS, NMFS, ADF&G, NVE, and others. The Bradley Lake Hydroelectric Project, in comparison, ensures Bradley River instream flows of 40 cfs in the winter and 100 cfs in the summer. These instream flows have been used successfully for over 30 years. Note the Bradley and Eklutna watersheds have a lot of commonalities including watershed size, lake size, and glacier fed lake inflow.

Project owner proposed maintenance flow of 220 cfs for 3 of 10 years may be inadequate. Maintenance flows suggested by USFWS, NMFS, ADF&G, NVE, and others range between 325 cfs and 700 cfs, with a frequency ranging from 3 of 10 years to annually. For comparison, Bradley River maintenance flows, derived from the unregulated North Fork, exceed 500 cfs 3 of 10 years.

The Project owners proposed Eklutna River release facility design does not allow for increased instream and maintenance flow if their proposed flows don't sufficiently improve habitat as expected. There should be some flexibility to increase these flows.

The Project owner proposed program does not address sockeye habitat restoration and connectivity to Eklutna Lake. While sockeye restoration is not specifically mentioned in the 1991 agreement, the Divestiture Summary Report: Sale of Eklutna and Snettisham Hydroelectric Projects by the Alaska Power Administration, U.S. Department of Energy, April 1992, page 19, states "During reviews of legislative proposal, loss of key sockeye salmon run that once spawned in Eklutna Lake was identified. The loss was caused by a private power project constructed in the 1920's. The loss was not identified in pre-authorization studies for the Federal Eklutna Project and the Federal project does not include mitigation. This specific problem and the desires of the fish and wildlife agencies to provide appropriate consideration to fish and wildlife resources over the long run led to the August 7, 1991 agreement". The 1920's dam was removed in 2018 so the last remaining barriers preventing fish passage to Eklutna Lake are the existing configuration of the Eklutna Dam and the Program plan that leaves one mile of dry river bed. Sockeye restoration should be considered, including determination of viable spawning and rearing habitat in the Eklutna River, Eklutna Lake, and streams that feed into Eklutna Lake.

Railbelt energy production and cost to consumers are important. The Eklutna Hydroelectric Powerplant cannot generate electricity at its current level while releasing adequate instream and maintenance flows to the Eklutna River. A reasonable solution is developing the Dixon Diversion at Bradley Hydro which is estimated to produce 160,000 megawatt hours (MWH) annually, a significant increase over the average annual 102,000 MWH currently produced by Eklutna Hydro.

Cost burden for modifying, removing, or replacing the Eklutna Dam to allow sockeye passage doesn't have to be paid exclusively by utility rate payers. The 1920's dam was removed by an amazing collaboration between the Conservation Fund, Eklutna Inc., and the Native Village of Eklutna. Similar collaboration with many potential partners should be explored for sockeye mitigation.

Re: Public comment on Eklutna River Fish and Wildlife Program

Eklutna Hydro Project Development Team,

On behalf of Cook Inlet Region, Inc. (CIRI), I am submitting comments about the Eklutna River Fish and Wildlife Program (the Plan) released in October 2023.

I. Introduction

CIRI is one of twelve land-based Alaska Native Regional Corporations formed under the Alaska Native Claims Settlement Act of 1971 (ANCSA), 43 U.S.C. 1601. CIRI is comprised of over 9,200 Shareholders who live in Alaska and worldwide.

With 529,500 acres of surface estate and 1.6 million acres of subsurface estate, CIRI is one of the largest private landowners in Southcentral Alaska. CIRI's regional boundary and landholdings extend from the Matanuska-Susitna Borough, through the Municipality of Anchorage and the Kenai Peninsula Borough. Within CIRI's regional boundary are eight federally recognized Tribes and seven Alaska Native village corporations formed under ANCSA. CIRI and its affiliated Tribes and Village corporations are leaders in Alaska and collectively work for the benefit of our mutual stakeholders.

CIRI prioritizes the use of its land by Shareholders and Descendants for cultural, subsistence and recreational activities. CIRI regularly provides access opportunities on CIRI's privately owned land to the public.

CIRI manages a diverse and strategic investment portfolio for the long-term benefit of CIRI Shareholders and Descendants. CIRI has investments in energy and infrastructure, with a focus on renewable and green energy, along with significant Anchorage real estate investments. Notably, Fire Island Wind LLC, a CIRI company, owns and operates the 17.6-megawatt Fire Island Wind Project, located three miles off the coast of Anchorage. The project began delivering clean, renewable energy to Anchorage homes and businesses in the fall of 2012.

II. Comments on the Eklutna Draft Fish and Wildlife Program

The Eklutna Draft Fish and Wildlife Program is a requirement of the 1991 agreement (the Agreement) between the project owners and intended to be a substitute for the Eklutna Purchasers to obtain required licenses from the Federal Energy Regulatory Commission (FERC) at the time. The Agreement required the parties involved to study and understand the impacts over time of the Eklutna Dam (the Project) on fish and wildlife and develop proposals for the protection, mitigation, and enhancement of fish and wildlife affected by the Project.

Considering the region's energy and drinking water needs, the Plan does not adequately protect the Eklutna River or mitigate damage to the ecosystem caused by a river with years of no outflow. CIRI recommends the Plan be modified, or an alternative plan be adopted, to restore water flow to the full length of the Eklutna River.

The 1991 Agreement requires the project owners to mitigate the damage to fish and wildlife along the river due to the Project, and the Plan, as currently drafted, fails to provide adequate mitigations. The Plan leaves a section of the Eklutna River dry, and thus does not allow salmon access to spawning habitat and does not remedy the harm caused by the Project as required by the 1991 agreement.

The Agreement was intended to work "at least as well as Federal regulation for the intended purpose of mitigation and enhancement of affected fish and wildlife resources." The intent of highlighting mitigation efforts in the Agreement was impacted ecosystem restoration. Addressing the Project's impacts on fish and wildlife resources would be a requirement of the Project, were it to operate under FERC permits, and any mitigation or enhancement efforts that do not restore flow to the full length of the Eklutna River fall short of the Agreement.

While the actions taken, and engagement in the public process follow the requirements outlined in the Agreement, the recommendations made in the Plan do not. The lack of flow to the entire river, as outlined in the Plan, is defended with the specter that attempts to restore flow to the entire Eklutna River would result in ratepayer increases and impacts on the region's drinking water supply.

III. Conclusion

CIRI urges Eklutna Hydro and the Project owners to consider a Fish and Wildlife Plan that suitably balances the community's needs with their responsibility to adhere to the Agreement: mitigation and protection efforts that truly address the damage caused to the Eklutna River ecosystem and salmon runs.

Thank you for your consideration and the opportunity to provide comments on the Draft Eklutna Hydro Fish and Wildlife Program. Please contact me at (907) 274-8638 or slukin@ciri.com to discuss CIRI's comments further.

Re: Preferred alternative for the Eklutna Hydroelectric Project – restoration of Eklutna River and Lake salmon habitat and production

Dear Ms. Owen:

The Matanuska Susitna Borough Fish and Wildlife Commission (FWC) represents the interests of the Borough in the conservation and allocation of fish, wildlife and habitat. Specifically, the FWC advises borough officials, state or federal agencies and other organizations with interests that may affect conservation of fish, wildlife, and habitat across an area the size of West Virginia. Within this area, residents fish commercially, personal use dip net, sport fish, and four indigenous communities are important subsistence users—Tyonek, Knik, Eklutna and Chickaloon. The members of the FWC combined bring well over 150 years of experience managing fish and wildlife resources within Alaska.

It is the understanding of the FWC that in your capacity you represent the three owners of the Eklutna Hydroelectric Project. Pursuant to the 1991 Fish and Wildlife Agreement for Snettisham and Eklutna Projects we would like to provide our recommendations in the restoration of the historically important Eklutna River and Lake. In our opinion for this to be accomplished per the 1991 agreement will require sufficient water flows to support passage of anadromous fish species to and from Eklutna Lake to the confluence of the Knik River. United States Congresswoman Ms. Peltola clearly articulates that in authorizing the sale of the Eklutna Hydropower Project it was the intent of Congress that the Utilities must mitigate for drying up the Eklutna River. How best to accomplish this will require an investment that if done correctly will demonstrate how this hydroelectric project can be done responsibly and would gain a much broader public and environmental support. The recommendations offered by the National Marine Fisheries Service are proven steps which would provide for the positive outcome in meeting the objectives of the 1991 agreement. The FWC supports these recommendations and those offered through resolution by the Native Village of Eklutna.

It is important to note and clarify that the analysis performed by McMillen in addressing the potential spawning and rearing habitat for anadromous fish species and the primary productivity of Eklutna Lake seems to ignore the production of very similar lakes within Alaska. It also seems to ignore the effects of salmon carcasses in providing nutrient amendments for sustaining and restoring stream and lake productivity.

The portal option is not a vital option if in fact the goal is to restore both the river and lake to their historical production. Leaving approximately 1 mile of dry riverbed definitely fails to connect the river to the lake and would ignore the goal of restoring the lakes' productivity. Basic understanding of fish production clearly points to the need of having both Eklutna Lake and River connected by continuous water flow.
Providing fish passage from the river to the lake when properly engineered has been demonstrated in many river/lake systems throughout the Pacific Northwest. Here in Alaska, one only has to look as far as Kodiak Island and the Frazer Lake system. Frazer Lake is the second largest lake on Kodiak, and was barren of anadromous fish. A 10-meter waterfall stood as a barrier for sockeye salmon heading back to their natal waters to spawn. A fish pass was constructed around the barrier, which allowed fish to autonomously migrate up and access Frazer Lake and tributary spawning habitats. Frazer Lake is one of the most successful introduced runs in the world and a major producer of sockeye salmon in the Kodiak Management Area, with annual runs exceeding 1 million in recent years. When comparing Eklutna Lake to Frazer Lake surface acres you find very similar sizes, 3,520 and 3,978 acres respectively.

An important point to consider, implementing a sound mitigation plan which not only restores fish production in this historically important system, is also an important step in maintaining and protecting the health of salmon in the Upper Cook Inlet area, the body which connects migratory salmon to the waters of the Matanuska Susitna Borough. The FWC greatly appreciates the coordination and work which has gone into this planning process. We look forward to a final plan which recognizes a process which brings back a salmon resource so important to us all.

Sincerely,

Andrew N. Couch

Andy Couch, Chair
Mat-Su Borough Fish and Wildlife Commission

Subject:	Eklutna Mitigation Public Comment
Date:	Tuesday, February 13, 2024 9:16:00 AM

Please accept the following comment on behalf of Eric Booton, CEA ratepayer.

Since its construction, the Eklutna Hydroelectric Project has grossly harmed a wild salmon stream of significant cultural importance. Now, nearly 70 years later, the time has come for project operators to take ownership of its impact. As currently operated, the obstructive project utilizes a diversion dam at the outflow of Eklutna Lake to block all of the water that would otherwise flow down the Eklutna River. Instead, 100% of the water is diverted - 10% of which is utilized to meet 90% of Anchorage's drinking water needs, 90% generates a scant amount of electricity before releasing the water into the neighboring Knik River. With no water flowing out of Eklutna Lake more than 8 miles of the Eklutna River are devoid of flowing water and the passage of adult and juvenile wild salmon into and out of Eklutna Lake is blocked. For nearly a century, salmon have clung to existence by a trickle of water as the health of the wild salmon population has been significantly diminished as a result of project operators' elective use of water.

The Eklutna Hydroelectric Project was sold by the federal government to the operators through a unique act of congress that came with the obligation to make up for the project's impact to fish and wildlife and their habitat. The sale also included a one of a kind arrangement allowing for the project operators to circumnavigate the FERC licensing process and lead their own mitigation process. While project operators and contractors sing their own praises, reality is the mitigation process so far is unworthy of celebration and has been marred with skepticism and concern by several parties and technical experts who contributed to it.

Following the review of the field studies, numerous alternatives were submitted by members of the technical working group that would appropriately balance the use of Eklutna Lake water in a manner that preserves access to drinking water, allows for continued operation of the project and appropriately meets the needs of wild salmon. It is disheartening to see that the project operators have taken advantage of their power under the 1991 agreement with a bullheaded attempt to overlook their project's impact and check the mitigation requirement box by doing as little as possible - which is exactly what we have witnessed with the the preferred alternative they have shared with the public.

The draft mitigation plan presented by the operators of the Eklutna Hydroelectric Project fails to make up for the project's impacts as required by the 1991 agreement and allows the project operators to pass the burden of responsibility to AWWU. The AWWU portal option presented is inadequate and concerning for the following reasons:

-

Only 40 cfs will be released in the summer (4% of historic flows) and 27 cfs in the winter. This is far from enough water to provide Eklutna River salmon with reliable access to spawning and rearing habitat, much of which is located in side channels that will be left dry with only 40 cfs of water. Additionally, the public is right to be skeptical that 27 cfs is an adequate winter flow for the survivability of salmon eggs.

- Water will be released into the Eklutna River from the AWWU pipe approximately a mile below the diversion dam at the outflow of Eklutna Lake. As a result, a mile of the Eklutna River will be left dry.

- Without flowing water, wild salmon will still be blocked from mitigating to and from Eklutna Lake and accessing the historic habitat in Eklutna Lake and its tributaries.

- Without access to Eklutna Lake, sockeye salmon will not be able to recover.

- The AWWU pipeline provides Anchorage's drinking water, the most important use of Eklutna Lake water. The operators preferred alternative places concerning and unnecessary stress to AWWU's infrastructure and is a risk to the drinking water supply of nearly all of the area residents.

- AWWU infrastructure undergoes routine maintenance in which the flow of water in the pipe is turned off. Regular maintenance of AWWU infrastructure will leave the Eklutna River dry during its duration and wild salmon at all life stages will be harmed.

- The AWWU portal draws water from an intake valve at the bottom of Eklutna Lake where it is significantly colder than the surface water that would flow down the Eklutna River under a normal flow regime. As a result, water from the AWWU portal may very well be too cold for the recovery of salmon. This concern has been made abundantly clear in the case of the botched mitigation of the Cooper Creek project where Chugach Electric Association has spent years attempting to engineer a solution that will pipe water of the appropriate temperature past the Cooper Creek dam and into Cooper Creek.

The Eklutna Hydroelectric Project does not provide flowing water to 8+ miles of the Eklutna River and does not allow fish passage to Eklutna Lake. The preferred alternative of the project owners only satisfies their interests and fails to mitigate any of the impacts that the project they are responsible for created. To this point, it is a devious attempt to escape responsibility and do little more than continue business as usual.

Area residents and the Eklutna people have held hope for a fully functioning and healthy

Eklutna River since the removal of the abandoned lower Eklutna dam in 2018 which removed a major barrier to reviving the fractured river system and mitigation of the Eklutna Hydroelectric Project has been the long anticipated opportunity to further repair the system with flowing water and fish passage. Additionally, the late Representative Young and his successor, Representative Peltola, have expressed their support for Native Village of Eklutna and restoring the river. The Anchorage Assembly has reiterated their support for restoration through numerous bi-partisan actions and the MatSu Fish & Wildlife Commission has also provided letters to the project operators reiterating the need for adequate flow and fish passage.

Though the mitigation process began in 2019, the public wasn't officially invited into the mitigation process until late 2023 when the draft fish and wildlife plan was released for review and comment. In January 2024, public meetings were hosted in Palmer, Anchorage and Eagle River. For 5 years many members of the public have been waiting for their opportunity to formally support restoring the Eklutna River by sharing their comment with the utility owners at the public meetings, the primary public engagement moment in the mitigation process. Without discussion or opportunity for public comment, I was vehemently dismayed when the "public meeting" was little more than a public relations presentation that the public was asked to attend. It is clear that the public meetings were engineered to minimize public involvement and promote the biased preferred alternative of the project owners as if it is the public's only option.

It is important to remember that the draft fish and wildlife plan is indeed a draft, and as written, it cannot be accepted by the public and ratepayers, and should not be accepted by Governor Dunleavy or the Parties to the 1991 Agreement. The AWWU portal put forth by the project operators still bears a $57 million price tag - that's $57 million that will be wasted on a mitigation plan that will leave the river fractured and fail to lead to a salmon fishery of any abundance. Yes, a mitigation plan that will meet the needs of wild salmon will come with additional costs, but those initial costs will come with significantly increased reward for Alaskans and the Eklutna people. This is why several groups, including Native Village of Eklutna, Eklutna Inc, The Conservation Fund and more, are on the record having committed to raise the funding necessary for engineering alterations to assist the utilities in enacting a mitigation plan that is likely to actually recover wild salmon.

To make up for the project's impact to fish and wildlife and their habitat, in honesty, it is critical that the final fish and wildlife plan include adequate flowing water the entire length of the Eklutna River and fish passage to Eklutna Lake for adult and juvenile fish. The AWWU portal is not a viable option and should no longer be pursued. Numerous alternatives were provided by members of the technical working group that would make an appropriate alternative to the AWWU portal and should be reconsidered, though removing the diversion dam is likely the best alternative to preserve drinking water, meet the needs of fish, and still

allow the Eklutna Hydropower Project to operate. Being that the mitigation process has been poorly conducted and stakeholders are far from agreement with the project operators, extending the process to avoid rushing to make a decision of severe consequence is a very reasonable request.

We built these dams and they have cost us, and the Eklutna people, more than we will ever fully know. Modernizing the operation of the Eklutna Hydroelectric Project to operate with a minimal impact to natural resources is both honorable and very achievable and any loss in power generation can be easily recovered with more renewables. Wild salmon are slipping throughout Alaska and, in the case of the Eklutna River, we do not have to accept a struggling salmon fishery, and it's not a future the Eklutna people should be asked to accept.

Dear Eklutna Hydroelectric Program Development Team,

Please accept the attached reports as comments on the Draft Fish and Wildlife Program for the Eklutna Hydroelectric Project.

The Anchorage Assembly has had concerns about unaddressed issues in the Draft Wildlife Program (AR 2024-40, As Amended), and therefore enlisted a consultant to research and report on those issues. The attached executive summary and full report were completed by Mr. Donald Spiegel with GV Jones & Associates, Inc.

Mr. Spiegel was retained to review the concept of providing Eklutna Lake water to the Eklutna River from an AWWU Portal Release Facility from both engineering and operations viewpoints. Mr. Spiegel is uniquely qualified to serve in this role due to his experience in the planning, design, construction and operation of water supply projects, his 45 years of experience on Water Supply and Water Treatment Engineering projects, and his five years of experience as Project Engineer and Lead Field Engineer on the design, construction and startup of the Eklutna Water Project.

Mr. Spiegel's review of project documentation for the AWWU Portal Release Facility coupled with his historical knowledge of the Eklutna Water Project identified significant project issues as are detailed in the attached reports.

Sincerely,

Christopher Constant

Assembly Chair Christopher Constant
District 1, North Anchorage

Assembly Vice Chair Meg Zaletel
District 4, Midtown

EXECUTIVE SUMMARY

Eklutna River Restoration Project

Project Issues Paper

GV Jones & Associates, Inc.

1200 E 76th Ave

Anchorage, AK 99518

Author: Donald Spiegel, P.E.

(February 14, 2024)

About the Author and the Author's Role:

Mr. Donald Spiegel has 45 years of experience on Water Supply and Water Treatment Engineering projects. He has a Bachelor's Degree and a Master's Degree in Environmental Engineering and has been involved with projects around the world with costs ranging from $5M to almost $5B. Mr. Spiegel was retained to review the concept of providing Eklutna Lake water to the Eklutna River from an AWWU Portal Release Facility from both engineering and operations viewpoints. Mr. Spiegel is uniquely qualified to serve in this role due to his experience in the planning, design, construction and operation of water supply projects but also based on his five years of experience as Project Engineer and Lead Field Engineer on the design, construction and startup of the Eklutna Water Project. Mr. Spiegel's review of Project documentation for the AWWU Portal Release Facility coupled with his historical knowledge of the Eklutna Water Project resulted in the identification of significant Project Issues as are detailed in this Project Issues Paper.

Executive Summary

The first Eklutna Hydroelectric Project was constructed in the late 1920's by Anchorage Light and Power Company. In 1950, the Federal Government, through the United States Bureau of Reclamation (USBR), proposed raising the original dam to create a larger lake that could provide more electric power to Southcentral Alaska. This Project, called the Eklutna Hydroelectric Project, was completed in 1955. In 1967 the Alaska Power Administration (APA) was established and all responsibility for the operation and maintenance of the Eklutna Hydroelectric Project was transferred from the USBR to APA. In 1991, the Federal Government agreed to sell its interest in the Eklutna Hydroelectric Project to a trio of local electric utilities: (1) Municipality of Anchorage dba as ML&P at a 53.33% share; (2) Chugach Electric Association at a 30.0% share; and (3) Matanuska Electric Association at a 16.67% share. As part of this 1991 Agreement, the new "Project Owners" agreed to develop and propose a program to protect, mitigate damages to, and enhance fish and wildlife impacted by the original Federal Hydroelectric Project. The program would necessitate the development of a year-round release of water to the Eklutna River. Ownership of the Eklutna Hydroelectric Project was officially transferred from the Federal Government to the new Project Owners on October 2, 1997.

In 2019, the Project Owners began a consultation process to discuss alternatives for providing year-round release of water and periodic channel maintenance flows from Eklutna Lake into the Eklutna River. This resulted in a three-year effort to study alternatives and to consult with environmental stakeholders. The study's selected alternative consists of construction of a new isolation valve structure and a new river release structure located adjacent to the Anchorage Water and Wastewater Utility (AWWU) Eklutna Water Project (EWP) Portal Valve Shaft approximately one mile below the Eklutna Dam. This alternative, called the AWWU Portal Release Facility, relies on use of existing AWWU infrastructure. The selected alternative, however, creates policy and infrastructure issues for AWWU that are discussed herein.

The review provided in this Project Issues Paper that follows this Executive Summary contains the following sections:

1. Introduction
2. Project Definition for the AWWU Portal Release Facility
3. Governance Issues
4. Description of the Eklutna Water Project Facilities
5. Eklutna Water Project Raw Water System Hydraulics
6. Review of AWWU Portal Release Project Facilities

Review of Project documentation for the AWWU Portal Release Facility coupled with the Author's historical knowledge of the EWP resulted in the identification of significant Project Issues as follows:

Issue #1 is a Governance Issue. The Project Owners represent the power production interests for the Project. Information exchange and dialogue with State and Federal resource agencies and some environmental interests have also occurred but little engagement from the water supply interests (specifically AWWU, but also the Alaska Department of Environmental Conservation, ADEC) appear to have taken place. In the documentation to date, there is no mention of future expansion plans of EWP facilities nor the certainty of emergency shutdowns and inspection/maintenance shutdowns of EWP facilities. In addition, there is no discussion of the present condition of the Intake Valve Shaft nor the Portal Valve Shaft which are both 35 years old. Expansion of the Eklutna Water Treatment Facility (EWTF) would severely limit the ability to divert water from the AWWU Portal Release Facility both in terms of time-of-year and likely in flow. And shutdown of EWP facilities, which will continue to occur, would stop the flow to the Eklutna River entirely. If AWWU facilities are to be used as part of the solution for providing year-round flow to the Eklutna River, dialogue and engagement with AWWU and ADEC are critical to ensure the long-term health and safety of the Anchorage Public Water System (PWS). ADEC will likely be interested in why a Public Water System is also being used as a River Restoration System.

Issue #2 is an Opportunity Cost Issue. The EWP was originally designed and constructed to serve a PWS demand of 70 mgd – which is 108.5 cfs. The EWP piping, both raw water and treated water, were designed and constructed for the 70 mgd system flow; the EWTF was designed and constructed for a plant flow of 35 mgd to more closely match the PWS demands at the time of construction. The EWTF, however, was designed and is configured to allow easy expansion to 70 mgd. No mention of the future expansion of the EWTF to 70 mgd is acknowledged in the AWWU Portal Release Facility documentation to date. The need to expand the EWTF in the future could occur for a number of reasons, including: (1) population increase particularly North of the Anchorage Bowl; (2) diminishing groundwater supply due to contamination from PFAS, de-icing compounds, arsenic and/or other contaminants; and (3) possible decrease in Ship Creek supply due to water rights issues and creek flows during certain times of the year (military and maintaining minimum creek flows have priority over the AWWU use). To forego the opportunity to expand the EWTF to 70 mgd, and thus to forego expansion of the AWWU PWS in the planned manner that has existed for over 30 years, must be considered a significant policy decision for the MOA. To supply future drinking water from a source other than Eklutna Lake would certainly increase the cost of water in Anchorage significantly in the future.

Issues #3 (Scheduled Maintenance) and #4 (Emergency Maintenance) are Public Relations Issues. The EWP raw water facilities, including the Intake Valve Shaft and the Portal Valve Shaft have mechanical, electrical, and instrumentation and control equipment that require periodic maintenance work that necessitates scheduled shutdown of the EWP. These scheduled shutdowns can last days or longer depending on the maintenance needs. In addition, the raw water facilities have automatic and manual emergency shutdown capabilities in case of damage due to earthquake, terrorism, or vandalism that also result in long outage times. Draining and refilling raw water facilities can add significant time to these shutdowns, whether scheduled or emergency. It must be understood that use of the AWWU Portal Release Facility does not provide

a 100% certain year-round water supply to the Eklutna River. Scheduled maintenance shutdowns as well as periodic emergency shutdowns will continue to occur and discharge of water to the Eklutna River during these events will stop. The resulting impact to fish spawning habitat and the fish population itself will be of major public interest, potentially manifesting as negative public opinion towards MOA in general and AWWU specifically. Simply stated, the AWWU Portal Release Facility does not provide the year-round release of water to the Eklutna River as is portrayed in Project documentation to date.

Author's Opinion. In the documentation to date for the AWWU Portal Release Facility, Eklutna Water Project facilities have not been represented correctly in terms of capacity and operation. The Eklutna Water Project should be considered a project of 70 mgd (108.5 cfs) capacity and the operation of EWP facilities must consider scheduled and emergency shutdowns that can last from a few days to many weeks. Adjustment for these considerations and more detailed and consistent engagement of AWWU and ADEC personnel must occur as soon as possible to ensure the long-term health and safety of the Anchorage Public Water System. As a result of the mistaken assumptions about the EWP, it is concluded that the proposed AWWU Portal Release Facility cannot provide adequate Eklutna River restoration flows nor can it provide year-round water without interruption. Thus, it is the Author's opinion that the AWWU Portal Release Facility as currently configured is fatally flawed and other Eklutna River Restoration alternatives, or additional complementary facilities, should be studied further.

END OF EXECUTIVE SUMMARY

Executive Summary -- Under Separate Cover

1. Introduction

The first Eklutna Hydroelectric Project was constructed in the late 1920's by Anchorage Light and Power Company. In 1950, the Federal Government, through the United States Bureau of Reclamation (USBR), proposed raising the original dam to create a larger lake that could provide more electric power to Southcentral Alaska. This Project, called the Eklutna Hydroelectric Project, was completed in 1955. In 1967 the Alaska Power Administration (APA) was established and all responsibility for the operation and maintenance of the Eklutna Hydroelectric Project was transferred from the USBR to APA. In 1991, the Federal Government agreed to sell its interest in the Eklutna Hydroelectric Project to a trio of local electric utilities: (1) Municipality of Anchorage dba as ML&P at a 53.33% share; (2) Chugach Electric Association at a 30.0% share; and (3) Matanuska Electric Association at a 16.67% share. As part of this 1991 Agreement, the new "Project Owners" agreed to develop and propose a program to protect, mitigate damages to, and enhance fish and wildlife impacted by the original Federal Hydroelectric Project. The program would necessitate the development of a year-round release of water to the Eklutna River. Ownership of the Eklutna Hydroelectric Project was officially transferred from the Federal Government to the new Project Owners on October 2, 1997.

The Project Owners have recognized that as the holder of significant water rights in the Eklutna Basin and as the operator of the existing hydroelectric facilities that substantially control the use and elevation of that water in Eklutna Lake, it is the responsibility of the Project Owners to provide water in the Eklutna River for the protection, mitigation and enhancement of fish and wildlife habitat. As a result, the Project Owners have committed to provide year-round instream flows to the Eklutna River.

2. Project Definition for the Eklutna River Release Facility

In 2019, the Project Owners began a consultation process to discuss alternatives for providing year-round release of water and periodic channel maintenance flows from Eklutna Lake into the Eklutna River. This resulted in three-years of effort to study alternatives and to consult with environmental stakeholders. The study began in March 2019 and continues today. The study's selected alternative consists of construction of a new isolation valve structure and a new river release structure located adjacent to the Anchorage Water and Wastewater Utility (AWWU) Eklutna Water Project (EWP) Portal Valve Shaft approximately one mile below the Eklutna Dam. This alternative, called the AWWU Portal Release Facility, relies on use of existing AWWU infrastructure. The selected alternative, however, creates policy and infrastructure issues for AWWU that are discussed herein.

AWWU owns, operates and maintains the EWP which supplies the Municipality of Anchorage (MOA) with approximately 90% of its drinking water. The EWP consists of raw water facilities (Lake Diversion Tunnel and Pipeline Segment P-4), the Eklutna Water Treatment Facility (EWTF), and treated water facilities (Clearwell and Pipeline Segments P-3, P-2 and P-1). Due to the location and elevation of the EWTF, high quality drinking water is supplied by gravity via 23 miles of treated water piping to the Anchorage Bowl. The hydraulic head from the treatment facility location pushes water as far South as Service High School and Potter Marsh in the Anchorage Bowl. There are turnouts along the treated water pipeline to the Anchorage Bowl for current and future drinking water supply to the Village of Eklutna, Joint Base Elmendorf & Richardson, and the communities of Peters Creek, Chugiak, Birchwood and Eagle River.

On the raw water portion of the EWP, the Portal Shaft is the terminus structure of the Lake Diversion Tunnel. The Lake Diversion Tunnel is approximately 8,600 feet long and six (6) feet in diameter and connects the original Eklutna Hydropower Plant tunnel to EWP Pipeline Segment P-4. The AWWU Portal Release Facility is proposed to be constructed immediately upstream of the EWP Portal Shaft. An isolation valve structure would be constructed, and a short section of existing piping would be replaced, to divert a portion of flow to the River Release Structure.

As presented for the AWWU Portal Release Facility alternative description, operation of the Eklutna River Release Facility is anticipated to be as follows:

- Normal Flow Release: Flow releases into the Eklutna River will vary seasonally with a winter flow of 27 cubic feet per second (cfs); which is equivalent to 17.5 million gallons per day (mgd) and a summer flow of 40 cfs (25.8 mgd) .
- Periodic Channel Maintenance Flow Release: Maintenance Flow releases will occur in 3 out of every 10 years and will require a maximum release of 80 cfs (51.6 mgd) from the Eklutna River Release Facility combined with additional release from the Eklutna Dam.

3. Governance

Overall governance; creating the framework for finance, contracting, construction, long-term operation and maintenance, and the resulting day-to-day decision making, for any project that uses water from a multipurpose lake or reservoir; can be complicated and onerous. This Eklutna Hydroelectric Project is no different. When year-round flows in the Eklutna River are realized, Eklutna Lake will be used as a source for: (1) public water system supply, (2) environmental protection, mitigation and enhancement, and (3) power production. Due to the potential of conflict over water appropriations and Project operations, particularly in dry years and during emergency events, governance for a project must be discussed and codified early. Governance can take the form of a Joint Powers Authority in which all of the interests have representation on a Governing Board but, at a minimum, a Memorandum of Understanding (MOU) between the

interests should be developed and signed to establish representation, decision making authorities and dispute resolution processes.

Ownership. To date, the Project Owners have been defined as MOA dba as ML&P, Chugach Electric and Matanuska Electric. These three Owner entities represent the power production interests for the Project. In addition to Owners, other stakeholders in this Project include Environmental and Water Supply interests. To date, several state and federal resource agencies and environmental organizations have been consulted to inform the Project's planning effort on issues related to the environmental protection, mitigation and enhancement progress of the Project. However, the water supply interests have had minimal involvement with the Project to date. This is evident from discussions and assumptions about the use of Eklutna Water Project facilities, especially with regards to future expansion and the certainty of scheduled and emergency shutdowns of EWP facilities.

Operations Philosophy. As part of any governance structure or MOU developed for operation of a **future river release facility**, it is imperative that an Operations Philosophy for Eklutna Lake be developed and agreed to by not only the Owner but also Environmental and Water Supply stakeholder interests as soon as possible. There is potential for conflict with Water Supply Stakeholders, especially with regards to future expansion of the EWTF, that must be discussed and resolved prior to the adoption of any Project alternative. In addition, scheduled shutdowns for inspection or repair of EWP infrastructure as well as emergency shutdowns will occur and have the potential to adversely impact the interests of Environmental stakeholders of the Project. Both of these issues are discussed further in Section 4 below.

Operations and Maintenance (O&M) Entity. It is important to agree on the O&M entity for any **future river release facility** as soon as possible. The O&M identity decision should be codified in the MOU and should be timed such that the selected O&M entity is part and parcel of the engineering planning, design and construction efforts that will precede its long-term O&M responsibilities.

PROJECT ISSUE # 1 is a Governance Issue – There is a need for a governance structure for ownership entities that requires regular engagement of all stakeholder parties with interests in the River Release Project: (1) Water Supply, (2) Environmental Protection, Mitigation and Enhancement, and (3) Power Production. The Project Owners only represent the power production interests for the Project. Information exchange and dialogue with State and Federal resource agencies and some environmental interests have also occurred but little engagement from the water supply interests (specifically AWWU, but also the Alaska Department of Environmental Conservation, ADEC) appear to have taken place. In the documentation to date, there is no mention of future expansion plans of the EWTF nor the certainty of inspection/maintenance shutdowns and emergency shutdowns of Eklutna Water Project facilities. In addition, there is no discussion of the present condition of the Intake Valve Shaft nor the Portal Valve Shaft which are both 35 years old. Expansion of the EWTF would severely limit the ability to divert water from the AWWU Portal Release Facility both in terms of time-of-year

and likely in flow. And shutdown of EWP facilities, which will continue to occur, would stop the flow to the Eklutna River entirely. If AWWU facilities are to be used as part of the solution for providing year-round flow to the Eklutna River, dialogue and engagement with AWWU and ADEC are critical to ensure the proper operation and long-term health and safety of the Anchorage Public Water System (PWS). ADEC will likely be interested in why a Public Water System is also being used as a River Restoration System.

4. Description of Eklutna Water Project Facilities

The EWP has supplied high quality drinking water to the community for over 35 years. The EWP was engineered and constructed between 1982 and 1988 with operations of the entire project commencing in the Summer of 1988. As stated earlier, AWWU owns, operates and maintains the EWP which supplies the MOA with approximately 90% of its drinking water. The EWP was planned such that high quality potable water produced by it could be distributed to the Anchorage Bowl by gravity without intermediate pumping. It also provides the ability to supply potable water to Eagle River and the Northern Communities between the treatment plant location and the Anchorage Bowl.

Intake. The EWP begins in Eklutna Lake with a shared intake facility. The intake provides water to both the EWP and the Eklutna Hydrpower Plant. The intake structure itself is located near the north shore of the lake approximately one (1) mile east of the dam and is fed by an excavated inlet channel approximately 100 feet wide and 700 feet long. The excavated channel is at the lake bottom and leads to a reinforced concrete box structure, open and protected by trashracks on its top, front and both sides. The trashrack portion is about 23 feet wide by 20 feet high by 22 feet long. The overall length of the structure is about 42 feet. The structure invert elevation is about Elevation 794 and the top is at approximate Elevation 814. Two important items to be aware of for the Intake:

- It is important to maintain submergence on the intake structure top so as to not entrain air into the flow to the EWP or the Eklutna Hydropower Plant. Air in the flowstream must be vented properly and can be problematic for downstream facilities. The Eklutna Hydropower Plant currently operates to maintain a minimum lake elevation at approximate Elevation 820.
- At lower lake levels during late spring and early summer months (say late April early July), the intake structure itself is often visible from the North shore of the Lake illustrating how little submergence can be present at the structure.

Intake Valve Shaft. The EWP is connected to the pre-existing 9-foot diameter tunnel that feeds the Eklutna Hydropower Pant. To construct the water supply for the EWP, a section of the pre-existing tunnel was removed and a new steel tee was placed to allow diversion of a portion of the water from the Eklutna Hydropower Tunnel to the new EWP Tunnel. A short section of new tunnel piping was then installed as part of the EWP to route water from the new Tee section to an Intake Valve Shaft.

The Intake Valve Shaft is a circular structure from bottom invert elevation of approximately 786 to a top of cylinder elevation of 913. A square structure sits on top of the circular bottom and extends upward to approximate Elevation 930. The Intake Valve Shaft houses the following:

- Mainline steel piping, 54 inches in diameter.
- Mainline Emergency Shutoff Valve (Ring Follower Valve with hydraulic operator) – in an emergency condition this valve can shutdown the entire downstream EWP.
- Mainline Isolation Valve (Butterfly Valve with hydraulic operator) – during normal operation, this valve can shutdown the entire downstream EWP.
- Smaller bypass piping and valving that allows the piping downstream of the above two mainline valves to be refilled from the upstream tunnel connection in a controlled and proper manner.
- Sump pump system including a sump pump discharge into the 54" mainline pipe.
- Pressure sensing lines upstream and downstream of the Ring Follower Valve to ensure informed operation of Eklutna Water Project facilities.
- Emergency high flow meter and transmitter which can alert Eklutna operations to a downstream pipeline break and can be used to shutdown flow to the downstream EWP. The signal from this meter is alarmed and monitored closely by operators at the EWTF.
- Intake Valve Shaft Flood Alarm which can alert operators at the EWTF to a pipeline break within the Intake Valve Shaft or myriad possible structural or mechanical problems at the Intake Valve Shaft. Water inside the Intake Valve Shaft can match Eklutna Lake level depending on the physical alarm condition.
- All electrical and other instrumentation (such as Eklutna Hydropower Tunnel Pressure, ventilation status, etc.) necessary for the proper operation and remote monitoring of the Intake Valve Shaft.

Two important items to be aware of for the Intake Valve Shaft:

- There are at least sixteen smaller pipe connections to the mainline 54" pipe and valves; many of those connections have corrosion present and may not have been operated for some time. All of the mechanical, electrical and instrumentation items listed above require periodic maintenance and inspection which often requires scheduled shutdown of the EWP that can last days, weeks, or longer depending on the maintenance needs. Draining and refilling time must be considered in all maintenance shutdowns. It is imperative that a Condition Assessment be performed and required maintenance activities identified and conducted for all mechanical, electrical, and instrumentation items in the Intake Valve Shaft as part of the Portal Release Facility work. It must be understood that use of the AWWU Portal Release Facility to provide year-round water to the Eklutna River is not a 100% certain water supply as periodic maintenance shutdowns will continue to occur.
- The Intake Valve Shaft has mechanical equipment, electrical supply and instrumentation and controls that shutdown the entire EWP under emergency conditions. An emergency

condition could manifest as a result of a major earthquake, failed downstream infrastructure, terrorism or vandalism attacks or simple error when working on electrical and instrumentation circuits. Emergency shutdowns have occurred in the past and will occur again in the future. Again, it must be understood that use of the AWWU Portal Release Facility to provide year-round water to the Eklutna River is not a 100% certain water supply as emergency shutdowns will continue to occur.

Lake Diversion Tunnel. Downstream of the Intake Valve Shaft is the Lake Diversion Tunnel which is approximately 8600 feet long and six (6) feet in diameter. The interior was inspected via robotic camera within the past few years and was found to be in good condition. Similar future inspections will be required. The inspections require that the EWP be shutdown and drained to allow entry of the robotic camera and to not distort the video recording.

As with the Intake Valve Shaft, it must be understood that use of the AWWU Portal Release Facility to provide year-round water to the Eklutna River is not a 100% certain water supply as periodic inspection shutdowns of the Lake Diversion Tunnel will continue to occur.

Portal Valve Shaft. The Lake Diversion Tunnel ends at the Portal Valve Shaft. The Portal Valve Shaft is a rectangular structure from bottom invert elevation of approximately 776 to a top of elevation of approximately 811. The Portal Valve Shaft houses the following:

- Mainline steel piping, 54 inches in diameter
- Mainline Isolation Valve (Butterfly Valve with hydraulic operator) – during normal operation, this valve can shutdown the entire downstream EWP.
- Smaller bypass piping and valving that allows the piping downstream of the above mainline isolation valve to be refilled from the upstream Lake Diversion Tunnel in a controlled and proper manner.
- Sump pump system including a sump pump discharge into the 54” mainline pipe.
- Emergency high flow meter and transmitter which can alert the operators at the EWTF to a downstream pipeline break and can be used to shutdown flow to the downstream EWP. The signal from this meter is alarmed and closely monitored by operators at the EWTF.
- Portal Valve Shaft Flood Alarm which can alert operators at the EWTF to a pipeline break within the Portal Valve Shaft or myriad possible structural or mechanical problems at the Portal Valve Shaft.
- All electrical and other instrumentation (such as Lake Diversion Tunnel Pressure, ventilation status, etc.) necessary for the proper operation and remote monitoring of the Portal Valve Shaft.

Two important items to be aware of for the Portal Valve Shaft:

- There are at least eight smaller pipe connections to the mainline 54” pipe and valve; many of those connections have corrosion present and may not have been operated for some time. All of the mechanical, electrical and instrumentation items listed above require periodic maintenance which often requires scheduled shutdown of the EWP that can last

days, weeks, or longer depending on the maintenance needs. Draining and refilling time must be considered in all maintenance shutdowns. It is imperative that a Condition Assessment be performed and required maintenance activities identified and conducted for all mechanical, electrical, and instrumentation items in the Portal Valve Shaft as part of the Portal Release Facility work. It must be understood that use of the AWWU Portal Release Facility to provide year-round water to the Eklutna River is not a 100% certain water supply as periodic maintenance shutdowns will continue to occur.

- The Portal Valve Shaft has mechanical equipment, electrical supply and instrumentation and controls that shutdown the entire EWP under emergency conditions. An emergency condition could manifest as a result of a major earthquake, failed downstream infrastructure, terrorism or vandalism attacks or simple error when working on electrical and instrumentation circuits. Emergency shutdowns have occurred in the past and will occur again in the future. Again, it must be understood that use of the AWWU Portal Release Facility to provide year-round water to the Eklutna River is not a 100% certain water supply as emergency shutdowns will continue to occur.

Raw Water Pipeline (P-4). Raw Water Pipeline Segment P-4 extends from the Portal Valve Shaft to the Eklutna Energy Recovery Station located on the EWTF site. The pipeline is approximately 6.2 miles in length and is routed in the Eklutna River Valley, exiting the river valley on a fairly steep incline to a plateau that is approximately 3,000 feet east of the EWTF site. Approximately 52% of the Segment P-4 pipeline is 60 inches in diameter with approximately 48% at 54 inches in diameter. An Air-Vacuum and Air-Release Valve Vault is located on the top plateau near the treatment facility at the high point of the Segment P-4 pipeline. The Air-Vacuum and Air Release assembly requires a water elevation of approximately Elevation 730 to have the float seat properly with no chatter. As discussed in Sections 4 and 5 below, the impact of the AWWU Portal Release facility on downstream EWP piping and facilities has not been discussed in any AWWU Portal Release Facility documentation to date.

Eklutna Energy Recovery Station. The Eklutna Energy Recovery Sation (EERS), located on the EWTF site, serves as the pressure and flow control structure for the downstream EWTF. The EERS houses a hydraulic turbine/electric generator that recovers energy from the water flow from the lake. The turbine was sized to recover the energy at lower plant flows; up to about 41 mgd – which is equal to 63.5 cfs. Higher flows were observed during start-up and plant testing but the turbine is nameplated at 41 mgd. Adjacent to the turbine in the EERS is a full capacity sleeve valve capable of supplying 70 mgd (108.5 cfs) – to the downstream treatment facility. The EERS and and the downstream EWTF were designed to be easily expanded from its original treatment capacity of 35 mgd (54.25 cfs) to an expanded future capacity of 70 mgd (108.5 cfs). At 70 mgd, the turbine would still run at 41 mgd and the sleeve valve would run at the difference of 29 mgd. Should the turbine be out of service for any reason, then the sleeve valve would operate at the full 70 mgd. All mechanical, electrical and instrumentation and control systems are in place today to allow operation of the EERS at 70 mgd.

Eklutna Water Treatment Facility. The limiting factor for operation of the EWP at a continuous flow of 70 mgd is the treatment process capacity at the EWTF. The EWTF was designed originally for a treatment capacity of 35 mgd to more closely match the PWS demands at the time of construction. The original design of the facility, however, provided the means to easily and inexpensively double the capacity when needed in the future. Some of the features designed and constructed in the 1980's for later use at the time of expansion are as follows:

- Raw Water System (all the facilities described above) were designed and constructed for a flow of 70 mgd. The EERS was designed to preferentially use the hydraulic turbine for energy recovery while also providing a secondary water passage with a sleeve valve. The sleeve valve can either add water to the turbine flow for future conditions or serve as a full flow bypass of the turbine. Section 5 below discusses the hydraulic design of the raw water system.
- The EWTF was designed and constructed with easy expansion in mind as follows:
    - Hydraulic channels have knock-out panels to allow easy connection of future hydraulic channels
    - Personnel access corridors have knock-out panels to allow easy connection of future personnel access corridors
    - Concrete joints have protected structural dowels and waterstop where future concrete structures will adjoin.
    - Process piping was extended and valved/capped for connection to future unit processes
    - All chemical storage spaces were designed for a plant flow of 70 mgd
    - Waste stream handling for waste filter backwash water was sized for a plant flow of 70 mgd, including recycle pumping
    - Waste stream handling for sedimentation basin solids was sized for a plant flow of 70 mgd, including recycle pumping.
    - The Treated Water Clearwell (treated water storage) located on the EWTF site was sized to accommodate a plant flow of 70 mgd. The Clearwell capacity is 15 million gallons and is well within industry norms for the future 70 mgd treatment facility capacity.
- The treated water system, the piping system from the treatment facility that parallels the Glenn Highway and enters the Anchorage Bowl adjacent to the Ship Creek Water Treatment Facility, is sized for 70 mgd. Treated Water Pipeline Segments P-3, P-2 and P-1 were sized to flow a total of about 25 to 30 mgd to the Village of Eklutna, Joint Base Elmendorf & Richardson, and the Northern Communities of Peters Creek, Chugiak, Birchwood and Eagle River. The remaining flow of 40 to 45 mgd is the flow available for use in the Anchorage Bowl.

PROJECT ISSUE #2 is an Opportunity Cost Issue. The EWP was originally designed and constructed to serve a PWS demand of 70 mgd (108.5 cfs). The EWP piping, both raw water and treated water, were designed and constructed for the 70 mgd system flow; the EWTF was

designed and constructed for a plant flow of 35 mgd to more closely match the PWS demands at the time of construction. The EWTF, however, was designed and is configured to allow easy expansion to 70 mgd. No mention of the future expansion of the EWTF to 70 mgd is acknowledged in the AWWU Portal Release Facility documentation to date. The need to expand the EWTF in the future could occur for a number of reasons, including: (1) population increase particularly North of the Anchorage Bowl; (2) diminishing groundwater supply due to contamination from PFAS, de-icing compounds, arsenic and/or other contaminants; and (3) possible decrease in Ship Creek supply due to water rights issues and creek flows during certain times of the year (military and maintaining minimum creek flows have priority over the AWWU use). To forego the opportunity to expand the EWTF to 70 mgd, and thus to forego expansion of the AWWU PWS in the planned manner that has existed for over 30 years, must be considered a significant policy decision for the MOA. To supply future drinking water from a source other than Eklutna Lake would certainly increase the cost of water in Anchorage significantly in the future.

It should be noted that if the EWP retains its originally planned 70 mgd (108.5 cfs) capacity, the flow releases from the AWWU Portal Release Facility may not accommodate the stated operational flows for the facility:

- Normal Flow Release: Flow releases into the Eklutna River will vary seasonally with a winter flow of 27 cfs and a summer flow of 40 cfs. **The 40 cfs flow in summer may not be available depending on lake level. Currently Eklutna Lake is operated below Elevation 850 during spring and most summer months which coincides with high water demands in the AWWU system. The original hydraulic design condition for the EWP provides 70 mgd of flow to the EWTF at the low lake level of Elevation 820. If additional water is released from the Portal Release Facility with lake Elevation at 820, it is likely that the EWTF cannot receive its 70 mgd design capacity. As lake levels increase from Elevation 820, some water can be provided by the Portal Release Facility. System hydraulics must be evaluated at 70 mgd to fully determine the flows available at the Portal Release Facility at varying lake levels with due consideration of the air/vacuum system at the high point along the P-4 pipeline.**
- Periodic Channel Maintenance Flow Release: Maintenance Flow releases will occur in 3 out of every 10 years and will require a maximum release of 80 cfs from the Eklutna River Release Facility combined with additional release from the Eklutna Dam. **The 80 cfs flow cannot be accommodated if the EWP is operating at 70 mgd (108.5 cfs).**

PROJECT ISSUES #3 (Scheduled Maintenance) and #4 (Emergency Maintenance) are Public Relations Issues. The EWP raw water facilities, including the Intake Valve Shaft and the Portal Valve Shaft have mechanical, electrical, and instrumentation and control equipment that require periodic maintenance work that necessitates scheduled shutdown of the EWP. These scheduled shutdowns can last days or longer depending on the maintenance needs. In addition, the raw water facilities have automatic and manual emergency shutdown capabilities in case of damage due to earthquake, terrorism, or vandalism that also result in long outage

times. Draining and refilling raw water facilities can add significant time to these shutdowns, whether scheduled or emergency. It must be understood that use of the AWWU Portal Release Facility does not provide a 100% certain year-round water supply to the Eklutna River. Scheduled maintenance shutdowns as well as periodic emergency shutdowns will continue to occur and discharge of water to the Eklutna River during these events will stop. The impact to fish spawning habitat and the fish population itself will be of major public interest, potentially manifesting as negative public opinion towards MOA in general and AWWU specifically. Simply stated, the AWWU Portal Release Facility may not be sufficient to provide the year-round release of water to the Eklutna River as is portrayed in Project documentation to date.

5. Eklutna Water Project Raw Water System Hydraulics

For conversations going forward concerning the AWWU Portal Release Facility, it is important to have an understanding of the raw water system hydraulics from Eklutna Lake to the EERS located on the EWTF site. As stated above, the EWP was designed and constructed as a 70 mgd water supply. The EWTF was designed and constructed at 35 mgd, with capability for easy and economical expansion to 70 mgd in the future. The raw water system, consisting of the Lake Diversion Tunnel, Pipeline Segment P-4 and the EERS was designed for a system flow of 70 mgd to match the future expanded treatment facility capacity.

Critical elevations considered in the original hydraulic design of the raw water system were: (1) Eklutna Lake Level (assumed to be Elevation 850 as average level and Elevation 820 as low level); and (2) the hydraulic grade line at the Air-Vacuum and Air Release Valve Vault on Pipeline Segment P-4 (required to be approximate Elevation 730). The hydraulic headloss between the Intake Valve Shaft and the Air-Vacuum and Air Release Vault is approximately 80 feet at a flow of 70 mgd. This allows the 70 mgd flow to barely satisfy the needs of the Air-Vacuum and Air Release Facility on Pipeline Segment P-4 when Lake Level is Elevation 820. Any additional headloss in the system created by flows for the AWWU Portal Release Facility at low Eklutna Lake levels could be problematic for EWTF operations. As Eklutna Lake levels increase above the assumed low level of Elevation 820, more water becomes available for release at the AWWU Portal Release Facility but it will not be in accordance with the stated operational flows for Eklutna River Restoration Project and the releases could be intermittent depending on hydrologic conditions.

PROJECT ISSUES – See Project Issues # 2, 3 and 4 in Section 4 above.

6. Review of Eklutna River Release Facilities

In a quick review of the concept design for the AWWU Portal Release Facility, some items to consider are:

- Replacement Piping at the Lake Diversion Tunnel connection will take some time to construct and will require shutdown of the EWP. The pipeline segment that would be removed is set in concrete slurry as bedding and would require additional time and effort to remove.

- Redundant Energy Dissipating Valves (Sleeve Valves) should be provided to ensure uninterrupted flow to the river should this AWWU Portal Release Facility alternative move forward.
- Electrical Supply at the Portal Facility is single phase, the sleeve valve actuators must be coordinated for this and may need to have DC actuators with battery supply for emergency closing. The controls for the valves should establish a control loop whereby desired flow and actual flow are compared and adjusted as necessary.
- Instrumentation and Control; SCADA Communications. Valve position, valve control, upstream pressure and discharge flow must be communicated back to the EWTF so the operators understand what is occurring on the raw water system.

PROJECT ISSUES – See Project Issue #1 in Section 3 above. A governance structure necessitating involvement of AWWU Operations and Engineering staff is critical for the success of the River Restoration Project and to ensure operation of any facility that connects to the EWP does not impact the supply of potable water to the PWS. The comments above are illustrative of the type of comments that should be expected from any review of facilities that connect to the existing PWS.

Dear Eklutna Hydroelectric Program Development Team,

Please accept this resolution, AR No. 2024-40, As Amended, as the Anchorage Assembly's public comments on the Draft Fish and Wildlife Program for the Eklutna Hydroelectric Project. AR No. 2024-40 was amended and approved by the Anchorage Assembly on February 2, 2024.

Sincerely,

Assembly Chair Christopher Constant
District 1, North Anchorage

Assembly Vice Chair Meg Zaletel
District 4, Midtown

ANCHORAGE, ALASKA
AR No. 2024-40, As Amended

A RESOLUTION OF THE ANCHORAGE ASSEMBLY SUBMITTING PUBLIC COMMENT ON THE DRAFT FISH AND WILDLIFE PROGRAM FOR THE EKLUTNA HYDROELECTRIC PROJECT.

WHEREAS, the Municipality of Anchorage, Chugach Electric Association (CEA), and Matanuska Electric Association (MEA) (collectively "the Hydroelectric Project Owners") jointly own the Eklutna Hydroelectric Project and are parties to the 1991 Fish and Wildlife Agreement (the "1991 Agreement") with the State of Alaska, the U.S. Fish and Wildlife Service and the National Marine Fisheries Service (an agreement that notably excludes a key stakeholder, the Native Village of Eklutna, the federally recognized tribe whose ancestral homelands encompass this project) to fund studies to examine and quantify the impacts of the Eklutna Power Project on fish and wildlife; examine and develop proposals for the protection, mitigation, and enhancement of fish and wildlife affected by such hydroelectric development; and prepare a Proposed Final Fish and Wildlife Program (the "Fish and Wildlife Program") for approval by the Governor; and

WHEREAS, once approved by the Governor, the Fish and Wildlife Program will contractually bind operations of the Eklutna Hydroelectric Project and Anchorage Water and Wastewater Utility ("AWWU") for the next 35 years; and

WHEREAS, in their Draft Fish and Wildlife Program to mitigate their impacts to fish and wildlife pursuant to the 1991 Agreement, the Hydroelectric Project Owners propose to utilize AWWU infrastructure to deliver water into the Eklutna River via a Portal Valve (the "Portal Valve Alternative") one mile downstream of Eklutna Lake; and

WHEREAS, the policy of the Municipality of Anchorage has been to support restoration of the Eklutna River since the Anchorage Assembly adopted AR 2017-324(S), "A Resolution in Support of Efforts to Restore the Eklutna River," and AR 2022–262, As Amended, "A Resolution of the Anchorage Municipal Assembly in Support of Efforts to Restore the Eklutna River"; and

WHEREAS, further, through the passage of AO 2023-131, As Amended, the Assembly, through the creation of a specific law, reinforced and declared that it is the official policy of the Municipality of Anchorage, inclusive of the Anchorage Hydropower Utility Department, to restore the continuous water flow of the Eklutna River and the fish populations of the River and Eklutna Lake, to the greatest extent possible, subject to all provisions of the 1991 Agreement; and

WHEREAS, any changes to the Eklutna Hydroelectric Project will impact not only hydroelectric power and drinking water, but also fish and wildlife; and

WHEREAS, Eklutna Lake is the primary source of Municipality's drinking water for which AWWU currently pays approximately $1.2 Million annually to the Eklutna Hydroelectric Project to ensure access to the Municipality's drinking water and any binding agreement relating to the purchase price of water and volumes available to AWWU may impact property rights of AWWU and the regulated price of water to its customers; and

WHEREAS, the Anchorage Assembly was recently briefed about the changing regulatory environment for drinking water, and while the effects of the regulatory changes are currently unknown, concern has been raised about the availability of drinking water from ground wells under the new regulations; and

WHEREAS, the Anchorage Assembly hired an expert engineer, Don Spiegel, who originally designed the Eklutna AWWU system, to evaluate the Portal Valve alternative as it relates to AWWU's operation of the Eklutna Water Treatment Facility and the effectiveness of the Portal Valve Alternative in delivering water to the river to support the restoration of fish species; and

WHEREAS, the initial conclusions of Mr. Spiegel, which were submitted to the Assembly through AIM 2024-11 on January 23, 2024, raise significant doubts as to whether the Portal Valve Alternative will meet the mitigation objectives stated on a year round basis: inability to meet those objectives could result in AWWU and the Municipality being culpable and liable for the death of any in-river species that have returned, depending on water levels provided by the Hydroelectric Project Owners, and could be a limiting condition for AWWU expansion in the future; and

WHEREAS, the public comment period for the Draft Fish and Wildlife Program is open until February 19, 2024; and

WHEREAS, following the public comment period is an opportunity for the Hydroelectric Project Owners to review the comments and resolve any disagreements prior to submitting a final proposal to the Governor; and

WHEREAS, the Native Village of Eklutna has put forward an alternative for removal of the dam at Eklutna Lake, which is supported by the Municipal policy stated in AO 2023-131, As Amended, and codified at AMC 26.30.025A., but was never fully considered by the Hydroelectric Project Owners and has not been presented as an alternative in the Draft Fish and Wildlife Program; and

WHEREAS, in addition to the stated policy and support for dam removal, the Anchorage Assembly has evaluated the Portal Valve Alternative and has concerns about that alternative; and

WHEREAS, in the interest of protecting the future of the Municipal water supply as well as the interests of its residents and municipal taxpayers, the Anchorage Assembly submits the following public comments on the Draft Fish and Wildlife Program regarding the Portal Valve Alternative;

NOW, THEREFORE, THE ANCHORAGE ASSEMBLY RESOLVES and submits the following as its comments on the Draft Fish and Wildlife Program:

Section 1. The following are process and technical concerns particular to the Portal Valve Alternative put forward by the Hydroelectric Project Owners for public comment:

A. **Non-Compliant Process**. The August 7, 1991 Fish and Wildlife Agreement (1991 Agreement) sets forth a process for addressing the Eklutna Hydroelectric Project's impacts on fish and wildlife similar to that for Federal Energy Regulatory Commission ("FERC") licensed projects. The process set forth in the 1991 Agreement was intended to be at least as robust as a normal FERC license process, which is subject to all the provisions of National Environmental Policy Act ("NEPA") and all the authorities typically granted to the federal agencies. The process engaged by the Hydroelectric Project Owners falls short of the FERC standard of analysis. No NEPA analysis was done, the federal agencies were denied the authorities they normally would have, such as to prescribe fish passage, and the public wasn't presented any alternatives to choose from. Moreover, the process engaged in does not appear comparable to the NEPA requirements to consult with Native Tribes impacted by the project (18. C.F.R. 5.7), nor have a dispute resolution process allowing agencies to mandate conditions (18 C.F.R. 5.8 and 5.15).

None of state or federal signatories to the 1991 Agreement have so far supported the Portal Valve Alternative. The comment letters from these state and federal resource agencies raise questions around the process engaged by the Hydroelectric Project Owners, the data inputs used in modeling to develop the Draft Fish and Wildlife Program, and the viability of the Portal Valve Alternative to achieve the stated goals of the 1991 Agreement. These questions are unresolved.

Similarly, the process under the 1991 Agreement diverges substantially from the type of alternatives analysis the Municipality uses on its own capital projects. Often the Municipality's own large capital projects, such as the Port of Alaska Modernization Program ("PAMP") or projects co-funded through the Anchorage Metropolitan Area Transportation Solutions ("AMATS") design alternatives, are evaluated by experts and relevant stakeholders and the Assembly is briefed and able to weigh in on the proposed alternatives, particularly where Municipal resources are required to fund the projects. Based on the information the Assembly has been provided to date, only one alternative was seriously evaluated by the Hydroelectric Project Owners and put forward for consideration even though a Municipal contribution is expected through a property tax assessment.

B. **Potential Impacts to Anchorage Drinking Water .** Throughout this process, there has been very little discussion about any implications

on AWWU and the Municipality's access to drinking water now and into the foreseeable future (the next 35 years). The week of January 22, 2024, well after the Draft Fish and Wildlife Program was released and after years of discussion and presentation by the Eklutna Hydroelectric Project owners, we learned that the Hydroelectric Project Owners and AWWU, all public utilities regulated by the Regulatory Commission of Alaska (RCA), had signed a binding agreement in early October 2023, prior to submitting the Draft Fish and Wildlife Program for public comment. We learned this agreement is based on the Portal Valve Alternative and no other alternative; an alternative that may have significant impacts to the project outcome as well as to regulated rates authorized by the RCA. The Anchorage Assembly has requested a copy of the signed agreement, but we have been told the agreement is confidential and **could only review it in Executive Session** **[~~we therefore have been unable to review it.~~]** This is a significant hinderance on the Anchorage Assembly, and the public, to provide complete comments on the Portal Valve Alternative as related to AWWU operations, potential impacts to Municipal growth and strategic investments for AWWU and the Municipality. Significant legal questions also remain whether a binding agreement can be signed relating to future Municipal utility assets, revenues, and expenditures without Assembly approval.

Before learning of that agreement, the Anchorage Assembly hired an expert to analyze the effectiveness of the Portal Valve option in relation to AWWU's operation at Eklutna. That analysis by engineer Don Spiegel, who designed the Eklutna AWWU system, concluded that the Portal Valve "cannot provide adequate Eklutna River restoration flows, nor can it provide year-round water without interruption. Thus, it is the Author's opinion that the Portal Valve as currently configured is fatally flawed and other Eklutna River restoration alternatives should be studied further."

Furthermore, in the past month, AWWU has briefed the Assembly on new developments concerning drinking water regulation through federal and local entities. The impacts of the new drinking water regulations are yet to be determined, but AWWU leadership has expressed concerns about potential impacts to the Municipality from limitations of retaining full ground well capacity. Until the new regulatory landscape is better understood, particularly any reductions in access to drinking water from sources other than Eklutna, any future limitations on drinking water capacity at Eklutna should be held in abeyance.

C. **Incomplete Analysis and Insufficient Mitigation.** The Portal Valve Alternative does not meet the requirements of the 1991 Agreement regarding "the protection, mitigation of damages to, and enhancement of fish and wildlife affected by hydroelectric development of the Eklutna Hydroelectric Project." There are a number of variables related to lake level that can render the Portal Valve Alternative

inoperable. Additionally, regular and unexpected maintenance at the AWWU water facility will also stop the flow of water into the Portal Valve. Discontinuous water flows will result in fish kills in Eklutna River. The state and federal signatories to the 1991 Agreement have raised questions about the analysis and process used to develop the Draft Fish and Wildlife Program. The Hydroelectric Project Owners failed to consider all reasonable alternatives, including the dam removal alternative proposed by the Native Village of Eklutna. The Hydroelectric Project Owners failed to present the public with a full range of alternatives as would typically occur in similar situations.

D. **Poor Coordination and Questionable Use of Public Funds.** The Hydroelectric Project Owners and AWWU are regulated utilities and need to demonstrate benefit to their rate payers. Additionally, the Assembly, as the steward of taxpayer funds, must demonstrate benefit to the residents of the Municipality through the expenditure of public funds. Treating the Portal Valve Alternative as a singular stand-alone project is short sighted and does not maximize various opportunities to meet the goals and objectives of 1991 Agreement across various entities nor does it meet the requirements of these entities to benefit the public. The Portal Valve Alternative brought forward by the Hydroelectric Project Owners is self-serving and fails to protect the broader public interests of the Municipality of Anchorage. Given the $57 million price tag of the Portal Valve Alternative, its potential impacts to AWWU operations, and the financial implications to ratepayers and taxpayers for the next 35 years, we find this is a poor use of public funds and lacked public coordination.

For all the above reasons, the Anchorage Assembly cannot endorse and thus opposes the Draft Fish and Wildlife Program.

Section 2. The Municipality of Anchorage does not intend to issue authorizations or provide funds or any other form of support of the Draft Fish and Wildlife Program or any alternative that doesn't restore the full length of the Eklutna River and comply with policy of the Municipality, as recently enacted by AO 2023-131, As Amended, and codified at AMC 26.30.025A., as well as AR 2022-262, As Amended, and AR 2017-324(S).

Section 3. The Regulatory Commission of Alaska (RCA), under its statutory powers to initiate investigation into practices and facilities of a public utility, should review the Draft Fish and Wildlife Program and examine any impacts on any of the regulated utilities, including but not limited Chugach Electric, Matanuska Electric, Anchorage Hydropower and AWWU, particularly about impacts to rate payers and their access to uninterrupted service, **before** any option for a Final Fish and Wildlife Program is transmitted to the Governor for review and approval.

Section 4. The Anchorage Assembly requests the Hydroelectric Project Owners to seek a two-year extension of the 1991 Agreement from the signatories, of which the Municipality is one through the Anchorage Hydropower Utility, to perform additional analysis, consultation, and coordination with affected parties, including

the Anchorage Assembly and the Native Village of Eklutna. The issues at play are too significant to our community to rush to judgment or exclude key stakeholders. The residents of the Municipality deserve a measured and comprehensive approach guided by respectful coordination to reach a solution that enjoys broad consensus among the affected parties.

Section 5. This resolution shall be effective immediately upon passage and approval by the Assembly.

PASSED AND APPROVED by the Anchorage Assembly this 2nd day of February, 2024.

Re: Eklutna Hydroelectric Project Draft Fish and Wildlife Program

Dear Ms. Owen:

The Center for Biological Diversity ("Center") provides the following comments on the Chugach Electric Association, Matanuska Electric Association, and Municipality of Anchorage ("Project Owners")'s Eklutna Hydroelectric Project Draft Fish and Wildlife Program ("Draft Program").[1]

I. Purpose and Scope of the 1991 Fish and Wildlife Agreement

The purpose of the 1991 Eklutna Fish and Wildlife Agreement ("1991 Agreement") and the resultant Fish and Wildlife Program is to develop and implement measures to "protect, mitigate damages to, and enhance fish and wildlife (including related spawning grounds and habitat)" from the harms of the Eklutna Hydroelectric Project ("Project").[2] Currently, no water spills over the Eklutna Lake dam down the river except during floods. A 4.5-mile bypass tunnel diverts water from the lake to the power plant. Of the water diverted, 90% is diverted to the Knik River for hydropower, while 10% is diverted for Anchorage drinking and wastewater, effectively blocking the remaining 14 miles of Eklutna River from its water source.[3] The scope of the protection, mitigation, and enhancement requirements must include the entire Eklutna watershed, given the Project's substantial impacts to the flow of water, nutrients, sediment, fish, and wildlife, and more up and down the river, effecting the entire ecosystem far beyond the limited river corridor.[4] The Department of Energy's Environmental Assessment ("EA") for the Eklutna Purchase Agreement states that "[d]uring reviews of the legislative proposal, loss of a sockeye

salmon run that once spawned in Eklutna Lake was identified [...]. This specific problem and the desires of the fish and wildlife agencies to provide appropriate consideration to fish and wildlife resources over the long run led to the August 7, 1991 Agreement."[5] This shows that at minimum, the Fish and Wildlife Program must address reconnecting the lower river to the lake and upper tributaries. Moreover, since the lower diversion dam was removed in 2018, the Project's continued diversion of all controllable flow at Eklutna Lake and the complete disconnection of the river to the lake and upper tributaries are, and will continue to be, the primary causes for ongoing degradation of fish and wildlife habitat in the Eklutna River system. The Divestiture Report notes that the Agreement's fish and wildlife measures were intended to "work at least as well as Federal regulation for the intended purpose of mitigation and enhancement of affected fish and wildlife resources," and were to be "quite similar to that under the [Federal Energy Regulatory Commission ("FERC")] licensing" process for hydroelectric projects.[6]

II. The Draft Program Analysis is Incomplete, Flawed, and Otherwise Insufficient for a Decision under the Agreement

A. The Draft Program Does Not Meet the Purpose of the Agreement

The AWWU Portal Valve alternative proposed in the Draft Program by the Project Owners leaves Eklutna Lake and upper tributary streams completely disconnected from the lower Eklutna River, maintaining over a mile of dry streambed.[7] The flows the Project Owners propose to release from the AWWU Portal are the minimum flows considered by any of the Parties to the 1991 Agreement during the Agreement study process, with small high-flow events in only three out of every ten years.[8] The Draft Program provides no solution for the complete blockage of salmon reaching the extensive lake spawning habitat required by sockeye salmon and 15 miles of upper tributaries spawning habitat above the lake that is highly amenable to Chinook and coho salmon completely stranded.[9] Without a connection to Eklutna Lake and upper tributaries, mitigating and enhancing the disconnection and damage to those key spawning and rearing grounds and habitat is impossible. The Project Owners admit in the Draft Program that "no change in sockeye rearing habitat is anticipated."[10] The proposed nominal flow releases from the AWWU Portal will only minimally enhance Chinook and coho salmon and their habitat in the lower Eklutna River, including side channel and off-channel habitat. None of the federal and state fish and wildlife agencies consider the Draft Program to adequately meet the requirements of the 1991 Agreement.[11]

B. The Project Owners Did Not Follow the Delineation of Responsibilities in the Agreement

The Agreement carefully divides which considerations should be made by which Parties at which stage of the mitigation process. During the Study Plan stage, the Project Owners are "to examine, and quantify, if possible, the impacts to fish and wildlife from the Eklutna […] project" and "shall consider the impacts of fish and wildlife measures on electric rate payers, municipal water utilities, recreational users and adjacent land use, as well as available means to mitigate these impacts."[12] The Agreement then requires the Project Owners to recommend measures "for the protection, mitigation of damages to, and enhancement of fish and wildlife (including related spawning grounds and habitat)."[13] While it can be reasonably interpreted that the Program would include the analysis from the study plan of the impacts of fish and wildlife measures on other considerations, such as electric ratepayers, the Agreement does not state, as it does clearly in other sections, that other considerations, such as electric rate payers, power production or energy conservation, are to be considered when evaluating and recommending measures that are necessary to mitigate the Project's impacts on fish and wildlife.[14] The Agreement is clear that the Program's only consideration is meeting the purpose of the Agreement, which is "the protection, mitigation of damages to, and enhancement of fish and wildlife (including related spawning grounds and habitat)."[15] It is then the Governor of Alaska's responsibility, not the Project Owners', to evaluate whether the proposed Program of fish and wildlife measures is appropriate after considering the several criteria listed in the Agreement in making his final Program determination.[16] The Project Owners overreach their authority under the Agreement by claiming that they are charged not just with undertaking the study process, but also with undertaking the policy analysis to give equal consideration to the eight purposes the Governor must balance in his final decision when promulgating a Program.[17] They are neither qualified nor authorized to make policy determinations and have plain conflicts of interest.

C. The Project Owners Have Not Implemented the Consultation Process to Protect Fish and Wildlife from Project Impacts "At Least As Well" as a FERC Process

The consultation process agreed to in the Agreement was intended to be "quite similar to that under [FERC] licensing of hydroelectric projects with the Governor of Alaska assigned a role similar to FERC's in decisions on fish and wildlife measures."[18] The Agreement process was intended to work "at least as well" for fish and wildlife as a FERC relicensing process.[19] Yet, the consultation process has not been implemented in a manner that matches the procedural protections afforded to fish and wildlife in a FERC relicensing process. The deficiencies in the

process include not only the impacts of project construction, but the totality of impacts of project construction, operation, and maintenance on fish and wildlife and their habitat, including the temporal loss of services and functions of a free-flowing anadromous river.[20]

One of the primary deficiencies in the consultation process has been the Project Owners' conflation of improvements to the baseline condition with adequate protection, mitigation, and enhancement of fish and wildlife impacted by the Project. This misunderstanding of the level of protection the Project Owners are required to deliver under the Agreement, and that would similarly be required in a FERC proceeding, has contributed to an inadequate scope of study and alternatives analysis. Rather than develop and evaluate alternatives according to their comparative effectiveness in mitigating the impacts caused by the Project's dewatering of the Eklutna River and the resulting destruction of fish and wildlife habitat from the 1950s to present, the Project Owners evaluated alternatives according to their "ecological lift in terms of gains in salmon spawning and rearing habitat" compared to their cost.[21] However, "ecological lift" is not the same as providing adequate and equitable protection, mitigation, and enhancement of fish and wildlife. In short, the Project Owners have developed a Draft Program that would be marginally better for fish and wildlife, but not one that would actually mitigate the project's impacts on fish and wildlife.[22]

Another significant deficiency in the consultation process has been the Project Owners' unilateral rejection of reasonable alternatives without rigorous study or analysis.[23] This is a departure from a FERC relicensing proceeding where FERC, not the applicant, is required under the Federal Power Act ("FPA") and the National Environmental Policy Act ("NEPA") to undertake a full study of alternatives as the basis for determining that a project, as licensed, will be best adapted to a comprehensive plan of development.[24] Here, by contrast, the Draft Program

---

[20] *See* 40 C.F.R. § 1508.1(g) (definition of "effects" for purposes of environmental analysis under the National Environmental Policy Act); *see also* USFWS and NMFS, Final ESA Section 7 Consultation Handbook at 4-30 (Mar. 1998) ("The total effects of all past activities, including effects of the past operation of the project, current non-Federal activities, and Federal projects with completed section 7 consultations, form the environmental baseline."); *see also* 33 C.F.R. § 332.2 (Corps regulations requiring consideration of "temporal loss" in determining appropriate mitigation).

[21] Eklutna Draft Fish and Wildlife Program at 31 (According to the Draft Program, "[t]he process helped to narrow down the list of comprehensive alternatives by removing those that either did not provide a significant ecological lift, or where multiple alternatives provided a similar ecological lift, those that were more costly could be removed from consideration.")

[22] *See* Eklutna Draft Fish and Wildlife Program at 45-46.

[23] Based on our review, the Owners have exercised almost complete discretion in the scope and substance of the environmental analysis contained in the Draft Program document. This is a significant departure from a FERC proceeding where FERC is responsible for independently verifying any information it relies upon to comply with its statutory responsibilities to evaluate the environmental impacts of its licensing decisions. *See, e.g.,* 16 U.S.C. § 797d.

[24] 16 U.S.C. §§ 803(a), 808(a); *Green Island Power Auth. v. FERC*, 577 F.3d 148, 168 (2d Cir. 2009) (… "FERC is statutorily obligated, pursuant to the 'best adapted' standard outlined in sections 10 and 15 of the FPA, to give full consideration to all feasible alternatives, even where it ultimately cannot license those alternatives."). FERC is subject to a parallel requirement under NEPA to develop and conduct a rigorous and detailed analysis of all reasonable alternatives. 42 U.S.C. § 4332(2)(H), 40 C.F.R. § 1502.14. Given the potentially significant impacts of continued operation of a major hydropower project, FERC complies with NEPA by preparing an environmental document that evaluates the comparative merits of several alternatives in preparation for any licensing or relicensing decision. 40 C.F.R. § 1502(b); 18 C.F.R. §§ 380.5, 380.6

does not demonstrate the Project Owners adequately considered a reasonable range of alternatives proposed for analysis by the Parties and other stakeholders.[25] Rather than provide enough detail about each alternative for the Governor to "evaluate their comparative merits," the Project Owners peremptorily eliminated certain alternatives from detailed study based on their biased cost-benefit assessment.[26]

The Project Owners' exclusion of a dam removal alternative is an egregious error in the environmental analysis.[27] Dam removal is a reasonable alternative because it would provide the most protection, mitigation, and enhancement of fish and wildlife at a cost far lower than other alternatives considered.[28] Because the Draft Program does not consider dam removal, the Governor cannot make an informed decision as to how dam removal compares to the Project Owners' preferred alternative.

Again, in a FERC proceeding the Project Owners would not have been allowed to unilaterally limit the analysis of alternative measures, like dam removal, to mitigate the Project's impacts on fish and wildlife resources, over the objections of the National Marine Fisheries Service ("NMFS") and US Fish and Wildlife Service ("USFWS"). For example, under FPA section 18, NMFS and USFWS have authority to prescribe fishways that must be included, without modification, in any license issued by FERC.[29] Under FPA section 10(j), a FERC license must include conditions to "adequately and equitably protect, mitigate damages to, and enhance, fish and wildlife (including related spawning grounds and habitat) affected by the development, operation, and management of the project" based on recommendations from NMFS, USFWS, and other state and fish and wildlife agencies.[30] NMFS would consider the fishery management plan for Pacific salmon as a comprehensive plan for considering mitigation and enhancement for salmon in this process.[31]

Another significant deficiency in the consultation process has been the Project Owners' failure to evaluate the potential impacts of their proposed Draft Program and alternatives on the critically endangered Cook Inlet beluga whale – a national NMFS priority species – and its designated critical habitat which includes the mouth of the Eklutna River.[32] Again, such evaluation would be required in any FERC relicensing under Endangered Species Act ("ESA") section 7.[33] Given the

Under ESA section 7, all federal agencies, including FERC are required to consult with NMFS and/or USFWS to ensure that the reauthorization by the federal agency is "not likely to jeopardize the continued existence of any endangered species […] or result in the destruction or adverse modification of habitat of such species […]." 16 U.S.C. § 1536(a)(2); *see also*, FERC, Handbook for Hydroelectric

Agreement's express intent to provide comparable protection to a FERC proceeding, the Owners failure to fully evaluate the Project's impacts on the Cook Inlet beluga whale is inexplicable and unjustifiable.

D. The Draft Program Undervalues Traditional Ecological Knowledge

It is well-established traditional ecological knowledge that Eklutna Lake and upper tributary streams once hosted abundant salmon runs, including sockeye, Chinook, and coho salmon. The Draft Program dismisses the possibility of a substantial sockeye run to the lake and downplays the quality and quantity of salmon habitat in the upper tributaries. This conclusion ignores the traditional ecological knowledge of the Native Village of Eklutna ("NVE") that the Project Owners are well aware of and which was shared throughout the Study Plan process.[34]

E. The Preferred Alternative is Insufficient for Protection, Mitigation and Enhancement of High Flows Blocked by the Dam

High flows are essential to mimic beneficial flooding. The maintenance flow regime in the preferred alternative is severely inadequate. The 220 cfs maximum flushing flows in the Draft Program is less than 20% of the average flushing flows of 1,402 cfs that USFWS estimated would be necessary to recreate the flows that historically supported the natural fishery and created the natural river channel and off-channel habitat.[35] Worse, the Draft Program imagines the peak flow for just a few hours for just three out of every ten years before returning to conditions that approximate a severe drought. NMFS concluded that the proposed flushing flows in the Draft Program "are unlikely to modify substrates and support habitat complexity in a meaningful way after nearly a century of limited impactful flow events."[36] The chosen channel maintenance flow hardly mitigates for the Eklutna River's deprivation of almost a century of flooding with a maximum recorded value of approximately 3,000 cfs.[37]

F. The Draft Program Directly Contradicts Other Assessments of Historic and Potential Salmon Habitat in Eklutna Lake and Upper Tributaries

The Draft Program significantly discounts the potential of the upper Eklutna tributaries as vital salmon habitat. NVE's TWG 2021-22 Final Report combines traditional ecological knowledge with current surveys and science of the headwaters of the Eklutna River to conclude that there is expansive, preferred habitat for Chinook and coho salmon, which is currently occupied by Dolly Varden, showing its potential.[38] This report found that the clearwater tributaries for the West Fork have high-quality habitat and that much of the East Fork has suitable habitat in its main

[38] Native Village of Eklutna, TWG 21-22 Final Report.

stem and tributaries. NVE's Land and Environment Department has concluded that there are over 15 miles of salmon habitat in the upper tributaries.[39]

The Draft Program also significantly discounts the potential of Eklutna Lake as vital salmon habitat. The Draft Program concludes that there was never a large run of sockeye to the lake, pointing to limiting factors such as the lake's turbidity, nutrient levels, and size of kokanee.[40] This current condition may be due to the denial to the lake of marine derived nutrients from salmon carcasses and impacts from the current 40-60 foot biologically devoid varial zone resulting from hydroelectric power water drawdowns around the lake, including such impacts as reduced aquatic vegetation.[41] The Matanuska Susitna Borough Fish and Wildlife Commission's comments on the Draft Program state "[i]t is important to note and clarify that the analysis performed by McMillen in addressing the potential spawning and rearing habitat for anadromous fish species and the primary productivity of Eklutna Lake seems to ignore the production of very similar lakes with Alaska. It also seems to ignore the effects of salmon carcasses in providing nutrient amendments for sustaining and restoring stream and lake productivity."[42] Moreover, a primary source for the Project Owner's conclusion is a 2017 study, which they greatly misrepresent. The study concluded that its results "can[not be] construed as evidence that [salmon runs to the lake] did not [exist]."[43] The 2017 study, rather, found that, based on the lake's water volume and turnover rate, as many as 15,000 sockeye could have spawned in the lake annually, which is far from an insignificant number.[44] A co-author of the paper recently stated tha' "[a]nyone who cites the study to argue that Eklutna Lake had no salmon or an "insignificant" number isn't using it scientifically, they are using it politically."[45]

Kleinschmidt Associates surveyed 14 areas totaling 68,512 square ft. around Eklutna Lake that are potentially suitable for sockeye spawning under favorable lake level regimes. These are now largely in the barren varial zone due to 40-60 foot lake drawdowns. However, they contain appropriate slopes, gravel sizes and seeping groundwater or potentially suitable substrate for sockeye spawning, and there may be even more than reported. A total of 331 spawned-out kokanee were observed at Eklutna Lake during the survey period, finding "[s]pawned kokanee ranged from 4.5 – 6.5 inches […]"[46] Alaska Department of Fish and Game ("ADFG") biologists have told us these would grow to normal sockeye size if allowed to develop in the ocean and that these kokanee are likely descendants of a native ocean-run population, since there is no record that they were ever stocked. The Draft Program acknowledges that Trout Unlimited's Alternative and USFWS's Alternative B – modifying the current dam to allow upstream and downstream fish passage – both create significant gains in sockeye spawning habitat, which would come from increased lake spawning habitat.[47]

Overall, NVE Land and Environment Department's assessments indicate the following stream miles would be restored by reconnecting the lake and upper tributaries to the lower river and restoring the natural flow regime: 12 miles in the river below the lake, 7 miles in the lake, and 15 miles above the lake in the upper tributaries.[48] NVE Land and Environment Department's measurements are in stream miles, and that metric is used to assess lake habitat, so 7 miles of lake habitat undervalues the actual habitat available for restoration in the lake. These estimates also undervalue habitat off the main channel in the lower river below the lake that could be restored with higher flow releases than are proposed in the Draft Program. Full recovery would therefore restore a minimum of 34 miles of salmon habitat and likely much more taking into account the undervaluing of lake and off channel habitat. The Draft Program, on the other hand, proposes to marginally restore only 11 miles, less than 35% of the conservative estimate of possible salmon habitat in the Eklutna watershed.[49]

G. The Program's Analysis of Non-Salmonid Wildlife is Severely Inadequate

The Agreement's protection, mitigation, and enhancement purpose is not limited to salmon but instead includes all fish and wildlife impacted by the Project. Reducing the ecological function of the tidal wetlands, lower river, lake, and upper tributaries from the Project's impacts reduces the health of fish and wildlife throughout the watershed. However, the Draft Program is not built upon any surveys or studies of marine mammals and its consideration of terrestrial and avian wildlife and habitat is severely inadequate.

The wildlife habitat survey study area boundary was limited to the lower end of the lake, the current river channel corridor, and a section of the wetlands at the river mouth.[50] This study area boundary is insufficient and should have included the entire Eklutna watershed, including the upper tributaries, the entire lake, and the off channel stream areas in the lower river valley, given the Project harms to the whole Eklutna watershed ecosystem. Because of the limited study area, the wildlife analysis could not fully consider the protection, mitigation, and enhancement from all the alternatives, including the potential restoration of habitat from increasing flows and reconnecting the lower river to the lake and upper tributaries.

Terrestrial and avian wildlife and habitat studies were primarily conducted via aerial surveys and literature reviews, both which have issues regarding their accuracy and the amount of place-specific detail they can provide.[51] A recent scientific review of the accuracy of wildlife aerial surveys stated that aerial surveys can be an efficient platform to collect observational counting data "across large spatial areas," but which are far less well-suited for specific and small-scale geographies like the Eklutna survey area.[52] Furthermore, the review noted common errors such as "nondetection, counting error, and species misidentification" that if not adequately addressed at all stages of the study "can provide data that obscure animal-environment relationships or

[52] Davis, Kayla L. et al., Errors in aerial survey count data: Identifying pitfalls and solutions, 12 Ecology and Evolution e8733 (Mar. 18, 2022).

introduce biases into inferences."[53] The Project Owners provide no details or assurances that their limited surveys addressed these common errors. Furthermore, aerial and other surveys for wildlife were extremely limited. For example, only one day of raptor aerial surveys were completed, four days of migratory shorebird and waterfowl surveys were completed, and three days of moose surveys were completed, all during 2022.[54] These surveys would not account for any annual variation in wildlife abundance or timing in the Eklutna watershed, as well as seasonal access limitations, among other issues. Wildlife habitat analysis relied on historic and current aerial photography with no ground vegetation surveys completed.[55] Scientific literature on Alaska wildlife and habitat is rarely area specific and is therefore not necessarily a valid representation of species using the Eklutna watershed either for their full lifecycles or for their migration routes or travel corridors.

Overall, the Plan recognizes that increasing the Eklutna River's flow below the dam will "directly or indirectly benefit several ecologically and/or culturally important wildlife species" such as wolves, moose, raptors, and bears.[56] Yet, because of the severe lack of adequate baseline data, it is impossible to truly analyze and understand how the different alternatives would impact and potentially benefit all wildlife and their habitat and to what degree. For example, even though listed in the "observed or expected" wildlife list, the Draft Program fails to consider imperiled species like the Little brown bat (*Myotis lucifugus*) that rely on the Eklutna watershed and for which mitigation and enhancement of their foraging habitat in the lower Eklutna River valley, which is currently harmed by the Project, could be improved by increasing flows and rebuilding off channel habitat in the lower river.[57] The Draft Program also fails to analyze why certain wildlife populations appear to be below normal levels. For example, the Summary of Study Results notes that "[w]aterfowl and shorebird numbers in the study area were moderate and low, respectively, during the field surveys" and that "[s]horebirds were noticeably absent during the spring surveys."[58] This may be an example of a system that is in depression from nearly a century of harms from hydroelectric dams. These examples, and many others, highlight the Draft Program's inadequacies in considering and rigorously analyzing how the different alternatives would impact all non-salmonid fish and wildlife in the Eklutna system and whether the preferred alternative provides adequate mitigation and enhancement.

Regarding marine mammals, the Draft Program fails to consider the protection, mitigation, and enhancement of Cook Inlet beluga whales, one of the nation's most critically endangered marine mammals. The best available science shows that Cook Inlet belugas could significantly benefit from increased salmon runs in the Eklutna River. Given the mouth of the Eklutna River is within designated critical habitat in upper Cook Inlet where the majority of the Cook Inlet beluga population forages during the summer, the critically endangered whales should be a primary concern for the Program.[59] The 2011 critical habitat designation for Cook Inlet belugas identified shallow intertidal and subtidal waters of Cook Inlet in close proximity to medium to high flow anadromous fish streams along with four species of Pacific salmon (Chinook, sockeye, chum,

and coho) as essential to the beluga's conservation (also known as Primary Constituent Elements).[60] NMFS 2016 Recovery Plan for Cook Inlet belugas identifies prey availability as a threat of medium concern for their recovery.[61] NMFS acknowledges the heightened importance of prey availability, specifically Pacific salmon, for conserving Cook Inlet beluga whales. NMFS' Species in the Spotlight, 2021-2025 report states that, "[s]urvival and recovery of Cook Inlet beluga whales depend on an adequate quantity, quality, and accessibility of prey resources."[62] In a recent notice to issue an IHA proposal from the Port of Alaska, NMFS noted that, "Pacific salmon represent the highest percent frequency of occurrence of prey species in CIBW stomachs."[63] The notice highlighted that rich foraging areas to the north of the Port of Alaska, including the Eklutna River, are important to belugas and that the whales correlate their movements into Knik Arm around the timing of the salmon runs in those rivers.[64] A recent 2023 study by Wild et al. delineated portions of Cook Inlet, including Knik Arm and the mouth of the Eklutna River, as a Biologically Important Area (BIA) for the small and resident population of Cook Inlet beluga whales based on scoring methods outlined by Harrison et al. in 2023.[65]

The best available science shows that restoring abundant salmon runs to the Eklutna River may be one of the key strategies available for Cook Inlet beluga recovery by creating more foraging opportunities for belugas in upper Cook Inlet. The results of a 2020 study by Norman et al. suggest that "reproductive success in [Cook Inlet belugas] is tied to salmon abundance" in the Deshka River, which is also located in upper Cook Inlet near Knik Arm and the Eklutna River.[66] That study showed that "if salmon runs remained at their current levels, the [Cook Inlet beluga] population would likely continue its current slow decline," yet the study found that "if Chinook salmon increased 20% or more, the current decline would likely be reversed."[67] Furthermore, the study simulations found that "doubling the salmon abundance would be sufficient to allow recovery of the population regardless of impacts from other threats."[68] The study noted that while Chinook are the most nutritionally important salmon species for Cook Inlet belugas, belugas still rely on other salmon species as important prey.[69] Moreover, a recent 2023 study by McHuron et al. found that if there is enough prey abundance for Cook Inlet belugas, the whales can withstand other intermittent stressors, concluding that increasing prey availability increases the beluga's resiliency to threats.[70] Another recent 2023 study by Warlick et al. stated that "aerial

survey data suggest that the [Cook Inlet beluga] population continues to decline[, and the] leading hypotheses include reduced prey availability […].”[71]

The proposed nominal flow releases from the AWWU Portal will only minimally enhance Chinook and coho salmon and their habitat in the lower Eklutna River. The AWWU Portal provides no solution for the complete blockage of salmon reaching the extensive lake spawning habitat required by sockeye salmon and miles of upper tributaries spawning habitat above the lake that is highly amenable to Chinook and coho salmon, both of which are primary forage species for Cook Inlet belugas.[72] Without connection to Eklutna Lake, protecting, mitigating, and enhancing those key spawning grounds and habitat is impossible. In turn, the mitigation and enhancement for Cook Inlet beluga whales are likely to be minimal as well. Furthermore, no analysis was completed for how the other alternatives considered would benefit Cook Inlet belugas.

The Draft Program’s severely inadequate analysis of non-salmonid fish and wildlife fails to meet the purposes of the Agreement and the standard of a similar federal process, and severely inhibits the Governor’s ability to make an informed decision.

H. The Draft Program Does Not Provide Specific Information Regarding Additional Requirements for the Draft Program or Any Alternatives

The Draft Program states that there may be additional requirements to implementing the Program, including the potential need to secure permits, land rights, easements and Amendment of ADL 44944.[73] The Draft Program also states required tax increases approved by the Anchorage Assembly and CEA and MEA rate increases that must be approved by the Regulatory Commission of Alaska. However, it does not describe any strategies the Project Owners have developed for securing necessary permits, land rights, or tax and rate increase approvals for the Draft Program or any alternatives. Instead, the Draft Program document flatly states, “[s]hould any of these requirements fail to be achieved, the Project Owners will not be able to execute on the Fish and Wildlife Program.”[74]

The one binding approval the Project Owners to have appeared to have secured is with AWWU for the use of the AWWU pipeline.[75] This binding agreement should be made public under section 3 of the 1991 Agreement, especially because it appears to have been signed before the release of the Draft Program during the Study Plan period. Yet, the Project Owners have declined to provide this to the public after numerous requests from NVE, the Anchorage Assembly, and others. Without this binding agreement, the public was not able to fully provide

testimony and comment on the Draft Program. We believe the withholding of this document is unlawful on the 1991 Agreement. We request the Project Owners release this agreement with AWWU immediately.

Further, there is no basis for the Project Owners' suggestion that their inability to satisfy any "additional requirements" for implementation of the Program is a legitimate basis for their non-performance under the Agreement. Instead, the likelihood of the Project Owners being able to secure permits and property rights necessary for successful implementation of the Draft Program and reasonable alternatives is relevant to the alternatives analysis.

Based on our review, there are several issues related to the Project Owners' ability to secure permits for the Draft Program. The 15% design drawings included in the Draft Program show that the construction of the proposed AWWU Portal would include construction of above ground utility infrastructure as well as eight new bridges and road improvements for the AWWU water supply access road within Chugach State Park. Such construction within the State Park would be a "conversion" of Land and water Conservation Fund property requiring approval by the Department of Interior ("DOI").[76] Further, any DOI decision approving conversion would be a federal action requiring compliance with NEPA and ESA section 7.

Additional review of the 15% design drawings shows that the Draft Program includes the addition of riprap fill material directly into the Eklutna River channel at the location of the AWWU Portal discharge, which would be subject to compliance with Clean Water Act section 404 and may require an individual permit from U.S. Army Corps of Engineers. Such permitting decisions would also be a federal action subject to compliance with NEPA and ESA section 7.[77]

The Project Owners need to address these and any other permitting requirements and pathways for the proposed AWWU Portal as compared to dam removal and any other reasonable alternatives for the Parties, the public, and the Governor to make informed comments and decisions, respectively.

III. Interpretation of the Right to Judicial Review Limitation is Inappropriate and Unsupported

The Draft Program states that "Pursuant to the 1991 Agreement and APA Asset Sale Act, the Governor's decision regarding the provisions of the Final Fish and Wildlife Program is reviewable and enforceable by the Parties in the U.S. District Court for the District of Alaska."[78] We dispute this as a statement of the Project Owners' opinion, which has been misleadingly presented as a formal conclusion without any legal basis. Neither the APA Asset Sale Act nor the

[76] *See* Eklutna Draft Fish and Wildlife Program at Appendix E; *see also,* 36 C.F.R. § 59.3; *see also,* Alaska Department of Natural Resources, Chugach State Park Management Plan at 31-32 (Feb. 2016) ("All of Chugach State Park is considered an LWCF protected area and is subject to the program provisions. Any property within an LWCF protected area may not be wholly or partly converted to anything other than public outdoor recreation uses without the prior approval of the Secretary of the U.S. Department of the Interior." "Actions that may represent a conversion of use include installation of […] above ground utilities, development of roads for primary purposes other than recreation […]".)

[77] *See* Eklutna Draft Fish and Wildlife Program at Appendix E; *see also,* 33 U.S.C. § 1344.

[78] Eklutna Draft Fish and Wildlife Program at 17 (emphasis added).

Agreement limit judicial review to the Parties, and any such limitation would appear to violate principles of due process given, separate and apart from the enforceability of the Agreement as a contract between the Parties, the Governor's final decision on the Fish and Wildlife Program would affect rights and interests far beyond those of the individual Parties, including members of the Center.[79]

IV. Concerns Regarding the Project Owners Preferred Alternative Must Be Fully Analyzed

The Project Owners' "AWWU Portal Valve" preferred alternative is rife with issues that qualified, reputable, and independent experts have highlighted.[80] The Project Owners must fully analyze and understand these issues, as well as provide a plan for addressing them, before making any further decisions.

V. Adequate Dam Removal Analysis

Adequate analysis a dam removal alternative must be based on the following conditions and assumptions and must correct the following inaccuracies.

A. Dam Removal Only Once Alternative Sources of Renewable Energy Are Available

The dam removal analysis should presume that dam removal will only occur once alternative sources of renewable energy are available, such as the 65MW Dixon Diversion expansion of the Bradley Lake hydroelectric project, large-scale wind and solar energy projects, required enhanced grid efficiencies on the Railbelt through coordinated dispatch,[81] and increased consumer and commercial energy efficiency. It should be noted that there are no proposals or requests for analysis of dam removal that takes place before these conditions are met, and we are not requesting analysis of dam removal that would require Eklutna hydroelectric power to be replaced by methane gas.

B. AWWU Water Withdrawals and Downstream River Flow Concerns with the Eklutna Lake Dam Removed

The Project Owners have recently claimed that without the Eklutna Lake dam, AWWU water withdrawals in the winter months could cause flows out of the lake to cease and the river to run dry.[82] This analysis, and the modeling upon which it is based on, has never been presented to stakeholders, fish and wildlife agencies, or independent experts for verification, review, and feedback. Based on our initial review, we believe this analysis is highly misleading and based on incorrect assumptions. Moreover, we believe that even if the concern has some limited validity, there are highly feasible engineering solutions available to resolve the issue. Dam removal

[79] *See* Pub. L 104-58, title I § 104(c)(1); Fish and Wildlife Agreement at 5.
[80] *See*, Spiegel, Donald, Executive Summary: Eklutna River Restoration Project Issues Paper (Feb. 14, 2024); *See also*, Spiegel, Donald, Project Issues Paper: Eklutna River Restoration Project (Feb. 24, 2024); *See also*, Anchorage Assembly, Letter to Eklutna Hydroelectric Program Development Team (Feb. 16, 2024).

[82] McMillen, Eklutna Fish and Wildlife Program Chugach BOD Meeting Slides (Feb. 12, 2024).

analysis must be based on accurate AWWU withdrawal figures and vetted flow models, and include engineering solutions to downstream flow concerns.

The AWWU water withdrawal rates the Project Owners are basing their assumptions on are misrepresented. The AWWU system experiences maximum usage during the summer months of June and July (occasionally August), during weeks of hot summer weather. Water usage in winter months is significantly lower than in summer. This is very typical for systems in places like Anchorage that are not winter resort or heavily visited winter season areas (rather Anchorage is experiences a very significant influx of people during the summer months). Based on the historical record, AWWU production from Eklutna is as follows:

- Average annual production (average day for the year) is about 21 mgd (32 cfs)
- Minimum month production (November – January) is about 19 mgd (29 cfs)
- Maximum month production (June – July) is about 27 mgd (42 cfs)
- Maximum day production is about 32 to 33 mgd (50 to 51 cfs)

These production rates align with average rates for municipal and industrial water usage in municipalities nationwide. These rates show the significant increase in withdrawals and production in the summer months compared to the winter.

In a recent presentation by the Project Owners' consultant to the Chugach Electric Association Board of Directors, the consultant presented AWWU withdrawals as stable over the course of the year, stating that "With AWWU pulling their maximum water right of 41 MGC (63.4 cfs). The [sic] river would run dry most winters."[83] Based on historical averages, AWWU does not come close to withdrawing 63.4 cfs, even during maximum day production during hot summer weeks. And the rate of production is certainly not flat over the course of the year. These kinds of misleading presentations of data, along with no references as to the source of their data nor any presentation on the modeling upon which their flow calculations are based upon, call into question the reliability of their data and analysis.

Furthermore, there are highly feasible engineering solutions available to ensure that the Eklutna River can remain watered and AWWU can maintain withdrawals during winter months in dry years. For example, a potential solution would be to install a manhole (cylinder) pump station near the location of the existing dam that would intake water from the west end of the lake near the current dam and release it near the base of the current dam spillway structure. This pump station would allow continued flow in the Eklutna River during winter months in dry years while allowing continuous AWWU withdrawals of their historic averages (and up to their maximum water right). The exact locations of the pump station, suction pipe, and location of discharge pipe should be based on study of the profile and geology of the bottom of Eklutna Lake. AWWU has numerous cylinder pump stations of similar configurations in operation today, and cylinder pump stations are very common in sewer and drainage projects around the country and the world.

[83] McMillen, Eklutna Fish and Wildlife Program Chugach Board of Directions Meeting Slides (2024).

C. Costs of Dam Removal

The Project Owners have compared the potential costs of removing the Eklutna Lake dam to such projects as the Elwha and Glines Canyon dam removal project (more than $350 million) and Lower Klamath River dams removal project (estimated at $397 million). Those dam removal projects are categorically different and larger than removing the Eklutna Lake dam. For example, the Lower Klamath River dams removal project is the largest dam removal project in the world, including removing four dams on one of California's largest river systems and restoring thousands of acres of land previously inundated by four completely unnatural reservoirs. The lower Eklutna dam was removed for $7.5 million which was a far more difficult and complex, and thus expensive, project than what it would cost to remove the Eklutna Lake dam. Costs must be accurately analyzed for dam removal of the Eklutna Lake dam.

D. Eklutna Lake Level and Resultant Spawning Habitat

The analysis should assume that once the Eklutna Lake dam has been removed, Eklutna Lake must be kept sufficiently full and spilling into the Eklutna River, except for short time periods in rare winter months during dry years (and we suggest an engineering solution to address those rare periods). This means that the Eklutna Lake level must not fall below 851 feet such that all available lakeshore spawning habitat always remains inundated. In other words, the analysis must properly account for all available lakeshore sockeye spawning habitat under "full lake" conditions. Moreover, the analysis must properly account for the full mileage of available spawning habitat in the tributary streams above the lake.

E. Peak Flow Assessments

The Project Owners have stated in numerous presentations and letters that removal of the dam would result in flows below the lake "peaking at 2,500 cfs every few years to 4,000 cfs every ten years." In their 2019 Eklutna River Flow Assessment, USFWS's data shows that flows of 2,500 cfs and 4,000 cfs would be far less regular than every "few" to ten years, respectively. Rather, at the extremes, it shows the likelihood of 2,500 cfs flows are between ~5-50 years, and the 4,000cfs likelihood interval is between ~20-500+ years, with an annual probability of 0.2%.[84]

We contest the inflated peak flow numbers the Project Owners are using and the models upon which these flow estimates are being generated. These numbers and models are being used for subsequent dam removal analysis by the Project Owners' consultant and AWWU, and these analyses must therefore be called into question. We suggest consulting with the fish and wildlife agency experts, as the 1991 Agreement requires, and resolving any differences in models and flow estimates before any further analysis is completed. If differences remain, the fish and wildlife agency experts flow estimates for analyzing lower river flows after removal of the dam should be used.

F. Downstream Bridge Safety

[84] USFWS, Preliminary Fish Habitat Flow Assessment at Appendix B (July 14, 2019).

The Project Owners' have stated concerns about downstream bridge safety from peak flow events once the dam was removed. There are three main bridges below the Eklutna Lake dam: the Old Glenn Highway Bridge, the New Glenn Highway Bridges, and the Railroad Bridge.

The Old Glenn Highway Bridge was replaced in 2015. The Project Owners have stated without citation that this bridge's maximum hydraulic capacity is less than 1,800 cfs.[85] This is false and highly misleading. We assume that the Project Owners are basing this estimate on the 2015 Eklutna River Bridge Hydrologic and Hydraulic Report.[86] This report explicitly does not state that the bridge's maximum hydraulic capacity is less than 1,800 cfs. Rather, the analysis for the hydraulic capacity of the bridge only considered flows up to 1,800 cfs because the report considered 1,800 cfs the 500-year flood level with the dam in place. Using this report to state that the hydraulic capacity of the Old Glenn Highway Bridge is less than 1,800 is patently false. The correct conclusion of this report is that the new Old Glenn Highway Bridge has a hydraulic capacity of at least 1,800 cfs. The analysis can be implied to conclude that 4,000 cfs peak flows would be well within the new bridge's hydraulic capacity and would likely have no impact on the bridge, especially given the predicted infrequency of these peak flows. A supplemental hydraulic report would be required to accurately state the maximum hydraulic capacity of the bridge with the Eklutna Lake dam removed.

The Project Owners' Draft Program states that the New Glenn Highway Bridges, which were constructed in 1975, have a hydraulic capacity of less than 4,700 cfs.[87] There is again no citation for this statistic, and we wonder what analysis this figure relies upon. Nonetheless, given the Project Owners' estimated peak flows of 4,000 cfs, the New Glenn Highway Bridges have ~17% of additional hydraulic capacity and should not be negatively impacted by maximum peak flows. The Draft Program states that the Railroad Bridge has a hydraulic capacity of less than 8,000 cfs (also without citation). This is more than double the estimated peak flows. Without additional analysis that shows otherwise, we see no reason why the current downstream bridges cannot withstand peak flows from an undammed Eklutna River.

Additionally, the Project Owners have stated concerns about sediment transport during peak flow events from remaining sediment that was once trapped behind the lower Eklutna dam that was removed in 2018. Our proposed dam removal alternative advocates for the Eklutna Lake dam being removed within the next decade. There are abundant examples of dam removal projects that have safely addressed sediment transport and downstream infrastructure at a scale far greater than in the Eklutna, and the Project Owners' dam removal analysis should explore these examples and provide for a managed sediment reduction program before dam removal through planned flushing flows and other mechanisms.

G. AWWU Pipeline Scouring

The lower Eklutna River is certainly not the only river under which a pipeline flows, and while the Project Owners have cited scouring concerns, we request to see full analysis of these

[85] Project Owners, Eklutna Draft Fish and Wildlife Program at 8.
[86] R&M Consultants, Eklutna River Bridge Hydrologic and Hydraulic Report (Mar. 2015).
[87] Draft Program at 8.

purported issues and how they could be addressed. This analysis must be based on a river routing model at credible design flows to determine scour velocities and depths of the AWWU pipeline. The results of this model may show that there are no additional protection measures required to secure the AWWU pipeline. If the model shows the need for additional protections, the analysis must explore a wide range of options for addressing such scouring concerns. These options could include additional armoring, digging pipeline sections deeper, a combination of techniques, or any other treatments recommended by a pipeline expert. We feel confident there are highly feasible solutions to address these concerns.

H. Dam Removal Benefits to All Fish and Wildlife

The dam removal analysis must consider the benefits to salmon of not just reconnecting the lower river to the lake and upper tributaries, but also returning a more natural flow regime to the lower river, including all side channels and off-channel habitat. Moreover, as we discussed at length in our December 2023 comments on the Draft Program, the 1991 Agreement protection, mitigation, and enhancement requirements extend to all non-salmonid fish and wildlife in the Eklutna watershed. As such, the dam removal analysis must meaningfully analyze the impacts, especially the positive benefits, to all fish and wildlife. This includes the benefits of a restored natural flow regime along with sediment transport and restored off-channel habitat on shorebirds that use the Eklutna estuary and other birds in the watershed as well as terrestrial and marine mammals. In particular, the dam removal analysis must fully analyze the benefits of dam removal and potential resultant salmon abundance increases for Cook Inlet beluga whales, a critically endangered species listed under the federal Endangered Species Act.

VI. The Project Owners Should Agree to a Multi-Year Extension

We fully support and encourage the Project Owners and Parties to the 1991 Agreement to undertake a multi-year extension for further study, analysis, and resolution of differences before proposing a Final Fish and Wildlife Program.[88] The 1991 Agreement, as essentially a standard contract, can be revised, including its scheduled dates, with the agreement of all signatories.

Sincerely,

McMillen Jacobs

Todd Glass
Chugach Electric Association

RE: Addendum to TCF Comments on the Eklutna Draft Fish and Wildlife Program

Dear Ms. Owen and Mr. Glass,

Please accept the following as an addendum to the previously submitted formal comments and statement of position of The Conservation Fund on the Draft Fish and Wildlife Program. This addendum responds to remarks made by both of you as reported by Alaska Public Media under the header "Eklutna Hydro Owners Say They Won't Extend Wildlife Restoration Process." It's worth noting that even here the reporter uses the word "restoration."

We agree with Mr. Glass that the Eklutna Owners should not be obliged to restore the entire Eklutna River. Your obligations to restore the Eklutna River only obtain to that section of the Eklutna River degraded by the Eklutna Hydroproject; that is, the 8 miles between the former Lower Eklutna River Dam and Eklutna Lake that were and remain largely dewatered because of your operations. The only things stopping sockeye salmon from once again returning to Eklutna Lake are the Eklutna Lake "dam" and your dewatering of the river.

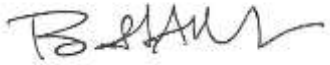
Mr. Glass, who appears to be speaking on behalf of the Eklutna Owners, asserts that "We never owned the lower dam. The dams were not part of what we bought in '97." A history refresher is in order for Mr. Glass. Anchorage Light & Power, the original develops of the Lower Eklutna Dam hydroproject, sold the project to the City of Anchorage in 1943; the City (which is now one of the Eklutna Owners) operated the Lower Eklutna River hydroproject until it sold "all its interest in and to said water rights, said generating plant, and associated facilities and properties" to the U.S. Bureau of Reclamation in 1953 for $1.8 million to allow for the development of the Eklutna Hydroproject at

Eklutna Lake. In 1989 the federal government agreed to sell to Eklutna Owners "the Eklutna Hydroelectric Project authorized, constructed, and operated pursuant to the Eklutna Project Act of July 31, 1950, including any and all property and facilities acquired or used in connection with Eklutna." According to the Initial Information Package "the asset lists developed for the sale pursuant to the 1989 Eklutna Purchase Agreement did not include the lower diversion dam." Prior to the demolition of the Lower Eklutna River Dam in 2016, Eklutna Inc. filed a quiet title action because of the uncertainty surrounding the ownership of the Lower Dam.

One of the Eklutna Owners (the City of Anchorage) clearly owned and operated the Lower Eklutna Dam, contrary to Mr. Glass's statement that "We never owned the lower dam." The City sold the Lower Dam and all its rights and infrastructure to allow for the construction of the Eklutna Hydroproject. "The signing of the above contract removed the last remaining legal hurdle to construction of the Eklutna Project." To claim that these two hydroprojects are not intimately and legally related is false.

The APRN reporting contained graphics presented by Ms. Owen that contend that the Eklutna River could run dry in the winter months of some especially dry years. Presumably the analysis behind these graphics factors in actual winter consumption, not average annual consumption? AWWU winter consumption (Nov – Feb) is typically 85-90% of average annual consumption (19 mgd vs 21 mgd [29 cfs vs 32 cfs]). This rare event can be managed through the installation of a pump and piping system as described in the attached documents. Such a system would be a natural compliment to the removal of the Eklutna Lake Dam and deserves to be incorporated into additional analysis.

Sincerely,



Brad Meiklejohn
Senior Alaska Representative

Eklutna River Restoration Project
Cylinder (Manhole) Pump Station in Eklutna Lake Proper

1 **Basis of Need** – there may be a need to improve (or add) to the AWWU Portal Project for various reasons as follows:

2 The AWWU Portal alternative is a "single straw" into Eklutna Lake. The operation and thus success of the alternative relies on 35-year old infrastructure to be 100% available. The suggested mitigation for the "single straw" option is use of an existing gated opening at the base of the Eklutna Dam spillway structure that would allow Eklutna Lake water (or some ponded water when the Lake level is below the gated opening) to flow into the Eklutna River. Project documentation has stated that the pond may be capable of supplying up to 12 hours of water. The gate will be controlled to open when the Eklutna Water Project infrastructure is unavailable. This is a flawed concept because the bottom elevation of the opening is Elevation 852. Eklutna lake is below Elevation 852 six months out of the year and thus the gate cannot provide reliable water for a long-term (greater than 12 hour) outage.

3 The last mile of the Eklutna River between the bottom of Eklutna Dam and the AWWU Portal facility is not part of the restoration zone.

4 The AWWU Portal release may impact the ability of AWWU to operate at the original design capacity of the Eklutna Water Project.

1. **Description of "Second Straw"** – Install one manhole (cylinder) pump station adjacent to Eklutna Lake near the Eklutna Dam and discharge to the pond that routes water to the gate at the base of the spillway structure. This Project alternative can alleviate all three concerns above**.**

National Office
1655 North Fort Myer Drive
Suite 1300
Arlington, Virginia 22209
(703) 525-6300
www.conservationfund.org

1. **Details of the "Second Straw":** Facilities necessary to construct the Second Straw:

- Construct one 16- foot minimum diameter concrete shaft adjacent to or in Eklutna Lake close to the existing pond. Bottom elevation should be at about 800. Top elevation should be at approximate Elevation 880 to match existing grade adjacent to the structure. The shaft top should be above Lake high water level for access and maintenance.
- Install three submersible non-clog centrifugal pumps, or three dry pit centrifugal pumps (depending on whether the shaft is designed for submersible or dry pit pump configuration). Pumps should be 8.6 mgd at about 45 feet of head (about 100 horsepower each) for 40 cfs total.
- Construct a suction pipe from the pump station into Eklutna Lake to obtain a bottom elevation of 800 to 805. Size would be 48-inch. Distance would be such to find the bottom elevation of 800.
- Install a stainless steel intake "crib" or box on the end of the suction pipeline.
- Install discharge pipeline from the pump station over the moraine to a close edge of the pond. Routing could be shallow bury and the pipeline must be anchored to prevent buoyancy. Pipeline number may be one at 36-inch diameter or two at 24-inch diameter. Civil works could reduce the piping length so that the water flows mostly overland to the pond.
- Provide a new electrical service from MEA to a new Electrical Room set at the top of the Pump Station. The pumps will be 480 volts.
- Construct one Electrical Room to house the electrical service equipment, three motor starters and control equipment.
- Operate the pump station in tandem with the AWWU Portal facility. Operation can take three forms: (1) the AWWU Portal Facility "straw" operates as primary; (2) the Eklutna Lake Pump Station "straw" operates as primary; or (3) both "straws" operate simultaneously. The two facilities will be communicating via SCADA so switchover for planned or emergency events can happen quickly and, if desired, automatically. No generator backup is thus required at the pump station.

1 **Pump Station Information:** Some information about the pump station in general and this adder alternative in particular:

2 Cylinder (manhole) pumps stations are very common in sewer and drainage projects around the country and around the world.

- AWWU has numerous cylinder (manhole) pump stations operating today of similar configurations and at depths of as much as 70 feet. Two example stations are Pump Station 2 in the Bootleggers Cove area of Anchorage (about 70 feet deep) and the Potter Creek Pump Station which is below water level all the time and is about 40 feet deep.
- Location of the pump station, location of the suction pipe and location of the discharge pipe within Eklutna Lake will require some study of the profile of the bottom of Eklutna Lake and also the geology of the bottom of Eklutna Lake. Exact placement can only occur after such study.

1. **Future Benefits of the "Second Straw":** This project adder blends well with the possibility of the future removal of the dam. The pump station can continue to operate as the dam is removed so the entire reach of the Eklutna River is maintained in a flowing condition. The pump station would also allow continued flow in the Eklutna River during periods in dry years when water is below the level of the moraine and is thus naturally unable to feed the Eklutna River.

Re: Eklutna Hydroelectric Project Draft Fish and Wildlife Program

Dear MOA, CEA, and MEA:

The Alaska Wildlife Alliance (AWA) provides the following comments on the Chugach Electric Association, Matanuska Electric Association, and Municipality of Anchorage ("Project Owners")'s Eklutna Hydroelectric Project Draft Fish and Wildlife Program ("Draft Program").[1] The Alaska Wildlife Alliance is a non-profit organization based in Anchorage, founded in 1978 by Alaskans, and speaks for more than 1,500 supporters of Alaska's wildlife. We advocate for healthy ecosystems which are ethically and scientifically managed to protect our wildlife for present and future generations.

Since the Eklutna Hydroelectric Project ("Project") became operational in 1955, it has caused the Eklutna River to run dry. The hydrological record is clear on this point:

> "Currently, no water spills over the Eklutna Lake Dam down the river except during floods. A 4.5-mile bypass tunnel diverts water from the lake to the power plant. Of the water diverted, 90% is diverted to the Knik River for hydropower, while 10% is diverted for Anchorage drinking and wastewater, effectively blocking the remaining 14 miles of Eklutna River from its water source."[2]

The Project's adverse effects on fish and wildlife resources in the Eklutna River were not evaluated for almost 70 years after project construction due, in part, to the existence of the lower diversion dam, which prevented salmon from ascending to Eklutna Lake and the upper reaches of the river. However, since the lower diversion dam was removed in 2018, the Project's continued diversion of all controllable flow at Eklutna Lake to the Project's powerhouse on Knik Arm and the complete disconnection of the river to the lake and upper tributaries are, and will continue to be under the Project Owners' Program, the primary causes for ongoing degradation of fish and wildlife habitat in the Eklutna River system.

[2] Native Village of Eklutna, "Eklutna River: Idlughetnu" (accessed Nov. 17, 2023) https://eklutna-nsn.gov/departments/land-and-environment/eklutna-river/; see also, Kleinschmidt Associates, Draft Instream Flow Technical Memo at 2 (Sept. 28, 2022) https://eklutnahydro.com/wp-content/uploads/2022/12/2022-9-27-EklutnaInstream-Flow-Tech-Memo_DRAFT.pdf ("In 1955, the federal government completed construction of a new hydropower project and in 1964 a new storage dam which effectively eliminated any flow releases from Eklutna Lake to the Eklutna River.").

Rather than fully evaluate alternatives that would avoid, minimize, or mitigate the project's adverse effects, as would generally be required for the relicensing of any other similarly-sized non-federal hydropower project, the Project Owners have put forward a Draft Program that would maintain those adverse effects by continuing to dewater a portion of the lower Eklutna River and deny salmon access to the majority of the system's salmon habitat for the next 35 years. The Draft Program shows that the Project Owners did not fully evaluate alternatives that would mitigate and enhance, let alone avoid or minimize the Project's ongoing impacts to sockeye, Chinook, and coho salmon habitat even though the loss of the sockeye salmon run was one of the express reasons for the 1991 Eklutna Fish and Wildlife Agreement.

Purpose of the 1991 Eklutna Fish and Wildlife Agreement

The purpose of the 1991 Eklutna Fish and Wildlife Agreement ("Agreement") and the resultant Fish and Wildlife Program is to develop and implement measures to "protect, mitigate damages to, and enhance fish and wildlife (including related spawning grounds and habitat)" from the harms of the Project.[3] Salmon spawning grounds and habitat harmed by the project include the lower Eklutna River below the dam, Eklutna Lake, and the upper tributaries to Eklutna Lake. The Divestiture Summary Report for the Sale of Eklutna and Snettisham Hydroelectric Projects ("Divestiture Report"), to which the Agreement is an appendix, notes that mitigating harms to sockeye salmon and their spawning habitat was particularly important in creating the Agreement. The Divestiture Report explained that "[d]uring reviews of the legislative proposal, loss of a sockeye salmon run that once spawned in Eklutna Lake was identified[...] This specific problem and the desires of the fish and wildlife agencies to provide appropriate consideration to fish and wildlife resources over the long run led to the August 7, 1991 Agreement."[4] The Divestiture Report notes that the Agreement's fish and wildlife measures were intended to "work at least as well as Federal regulation for the intended purpose of mitigation and enhancement of affected fish and wildlife resources," and were to be "quite similar to that under the [Federal Energy Regulatory Commission ("FERC")] licensing" process for hydroelectric projects.[5]

In comparison, the "AWWU Portal" plan proposed in the Draft Program by the Project Owners leaves Eklutna Lake and its upper tributaries completely disconnected from the lower Eklutna River, maintaining over a mile of dry streambed.[6] Furthermore, the flows the Project Owners propose to release from the AWWU Portal are the minimum flows considered by any of the signatory parties to the Agreement ("Parties") during the Agreement study process, with inadequate higher flushing flow events in only three out of every ten years.[7]

The Preferred Alternative ("AWWU Portal") is Insufficient for Salmon and Does Not Provide for a Connected Ecosystem

The AWWU Portal puts the least amount of water in the river of all the alternatives for regular flows and high-flow events.[8] The justification for choosing the lowest flow alternative primarily comes from economic considerations rather than what is best for fish and wildlife. The Agreement makes clear that the consideration of non-fish and wildlife factors should be made by the Governor, not by the Project Owners in the Draft Program. The preferred alternative continues to create a dead-end river, with over a mile of dry streambed below the dam. Creating a dead-end river hardly mitigates the damages caused to fish and wildlife from the Project because it prevents connectivity between Knik Arm, the lower Eklutna River, the lake, and the upper tributaries. The preferred alternative cannot mitigate damages to sockeye in any way because it will continue to prevent nearly all anadromous sockeye from spawning in the Eklutna River system. Because the destruction of the sockeye run was the "specific concern" leading to the Agreement, a Program that continues to prevent almost all sockeye from spawning is impermissible.[9] The preferred alternative permits less than 10% of the river to flow down its historic channel to the Knik Arm, the smallest amount of any proposed alternative.[10]

High flows are essential to mimic beneficial flooding. Seven of the nine alternatives proposed much more water during high flows, yet the Draft Program Plan settles on the lowest water discharge for channel maintenance flows of all discharges proposed. The maintenance flow regime in the preferred alternative is severely inadequate because it fails to return the river to its natural flow. The 220 cfs maximum flushing flows in the Draft Program is less than 20% of the average flushing flows of 1,402 cfs that USFWS estimated would be necessary to recreate the flows that historically supported the natural fishery and created the natural river channel and off-channel habitat.[11] Worse, the Draft Program imagines the peak flow for just a few hours for just three out of every ten years before returning to conditions that approximate a severe drought. NOAA Fisheries concluded that the proposed flushing flows in the Draft Program "are unlikely to modify substrates and support habitat complexity in a meaningful way after nearly a century of limited impactful flow events."[12] The chosen channel maintenance flow hardly mitigates for the Eklutna River's deprivation of almost a century of flooding with a maximum recorded value of approximately 3,000 cfs.[13]

The AWWU Portal proposal provides no solution for the complete blockage of salmon reaching the extensive lake spawning habitat required by sockeye salmon (which was the key driver for the Agreement in the first place) and 15 miles of upper tributaries spawning habitat above the lake that is

highly amenable to Chinook and coho salmon.[14] Without a connection to Eklutna Lake, restoring those key spawning grounds and habitat is impossible. The Project Owners admit in the Draft Program that "no change in sockeye rearing habitat is anticipated."[15] The proposed nominal flow releases from the AWWU Portal, which represent less than 10% of the inflows to Eklutna Lake, will only minimally enhance Chinook and coho salmon and their habitat in the lower Eklutna River and bear no resemblance to historic flows.[16]

As such, we do not support the AWWU Portal alternative because it does not provide for a connected ecosystem, as it:

- Fails to remedy the harms to sockeye salmon and their spawning habitat that instigated the Agreement and Program process;
- Leaves one mile of dry riverbed that prevents fish from reaching Eklutna Lake;[17]
- Blocks access to the majority of sockeye, Chinook, and coho salmon spawning and rearing habitat in the lake and its tributaries; and
- Delivers inadequate flows for fish below the Eklutna Lake dam.[18]

The Project Owners are not providing decision-makers and the public with the full range of alternative solutions and mitigation measures to meet the Agreement requirements. The Project Owners must select an alternative that would restore connectivity of Eklutna Lake and upper tributaries to the lower river.

The Program's Analysis of Non-Salmonid Wildlife is Severely Inadequate

The Agreement's protection, mitigation, and enhancement purpose is not limited to salmon but instead includes all fish and wildlife impacted by the Project. Reducing the ecological function of the tidal wetlands, lower river, lake, and upper tributaries from the Project's impacts reduces the health of fish and wildlife throughout the watershed. However, the Draft Program is not built upon any surveys or studies of marine mammals and its consideration of terrestrial and avian wildlife and habitat is severely inadequate.

The wildlife habitat survey study area boundary was limited to the lower end of the lake, the current river channel corridor, and a section of the wetlands at the river mouth.[19] This study area boundary is insufficient and should have included the entire Eklutna watershed, including the upper tributaries, the

entire lake, and the off-channel stream areas in the lower river valley, given the Project harms to the whole Eklutna watershed ecosystem. Because of the limited study area, the wildlife analysis could not fully consider the protection, mitigation, and enhancement from all the alternatives, including the potential restoration of habitat from increasing flows and reconnecting the lower river to the lake and upper tributaries. Terrestrial and avian wildlife and habitat studies were primarily conducted via aerial surveys and literature reviews, both which have issues regarding their accuracy and the amount of place-specific detail they can provide.[20] A recent scientific review of the accuracy of wildlife aerial surveys stated that aerial surveys can be an efficient platform to collect observational counting data "across large spatial areas," but which are far less well-suited for specific and small-scale geographies like the Eklutna survey area.[21] Furthermore, the review noted common errors such as "nondetection, counting error, and species misidentification" that if not adequately addressed at all stages of the study "can provide data that obscure animal-environment relationships or introduce biases into inferences."[22] The Project Owners provide no details or assurances that their limited surveys addressed these common errors. Furthermore, aerial and other surveys for wildlife were extremely limited. For example, only one day of raptor aerial surveys were completed, four days of migratory shorebird and waterfowl surveys were completed, and three days of moose surveys were completed, all during 2022.[23] These surveys would not account for any annual variation in wildlife abundance or timing in the Eklutna watershed, as well as seasonal access limitations, among other issues. Wildlife habitat analysis relied on historic and current aerial photography with no ground vegetation surveys completed.[24] Scientific literature on Alaska wildlife and habitat is rarely area specific and is therefore not necessarily a valid representation of species using the Eklutna watershed either for their full lifecycles or for their migration routes or travel corridors.

Overall, the Plan recognizes that increasing the Eklutna River's flow below the dam will "directly or indirectly benefit several ecologically and/or culturally important wildlife species" such as wolves, moose, raptors, and bears.[25] Yet, because of the severe lack of adequate baseline data, it is impossible to truly analyze and understand how the different alternatives would impact and potentially benefit all wildlife and their habitat and to what degree. For example, even though listed in the "observed or expected" wildlife list, the Draft Program fails to consider imperiled species like the Little brown bat (*Myotis lucifugus*) that rely on the Eklutna watershed and for which mitigation and enhancement of their foraging habitat in the lower Eklutna River valley, which is currently harmed by the Project, could be improved by increasing flows and rebuilding off channel habitat in the lower river.[26] The Draft Program also fails to analyze why certain wildlife populations appear to be below normal levels. For example, the Summary of Study Results notes that "[w]aterfowl and shorebird numbers in the study

area were moderate and low, respectively, during the field surveys" and that "[s]horebirds were noticeably absent during the spring surveys."[27] This may be an example of a system that is in depression from nearly a century of harms from hydroelectric dams. These examples, and many others, highlight the Draft Program's inadequacies in considering and rigorously analyzing how the different alternatives would impact all non-salmonid fish and wildlife in the Eklutna system and whether the preferred alternative provides adequate mitigation and enhancement.

Regarding marine mammals, the Draft Program fails to consider the protection, mitigation, and enhancement of Cook Inlet beluga whales (*Delphinapterus leucas*), one of the nation's most critically endangered marine mammals. The best available science shows that Cook Inlet belugas could significantly benefit from increased salmon runs in the Upper Cook Inlet. Given the mouth of the Eklutna River is within designated critical habitat in upper Cook Inlet where the majority of the Cook Inlet beluga population forages during the summer, the critically endangered whales should be a primary concern for the Program.[28] The 2011 critical habitat designation for Cook Inlet belugas identified shallow intertidal and subtidal waters of Cook Inlet in close proximity to medium to high flow anadromous fish streams along with four species of Pacific salmon (Chinook, sockeye, chum, and coho) as essential to the beluga's conservation (also known as Primary Constituent Elements).[29] NOAA Fisheries' 2016 *Recovery Plan for the Cook Inlet Beluga Whale* identifies prey availability as a threat of medium concern for their recovery.[30] NOAA Fisheries acknowledges the heightened importance of prey availability, specifically Pacific salmon, for conserving Cook Inlet beluga whales. NOAA Fisheries has also identified Cook Inlet beluga whales as one of the species most at risk of extinction, and in their Species in the Spotlight, 2021-2025 Action Plan, state that, "[s]urvival and recovery of Cook Inlet beluga whales depend on an adequate quantity, quality, and accessibility of prey resources."[31] In a recent notice to issue an Incidental Harassment Authorization (IHA) proposal from the Port of Alaska, NOAA Fisheries noted that, "Pacific salmon represent the highest percent frequency of occurrence of prey species in CIBW stomachs."[32] The notice highlighted that rich foraging areas to the north of the Port of Alaska, including the Eklutna River, are important to belugas and that the whales correlate their movements into Knik Arm around the timing of the salmon runs in those rivers.[33] A recent 2023 study by Wild et al. delineated portions of Cook Inlet, including Knik Arm and the mouth of the Eklutna River, as a Biologically Important Area (BIA) for the small and resident population of Cook Inlet beluga whales based on scoring methods outlined by Harrison et al. in 2023.[34] The best available science shows that restoring abundant salmon runs may be one of the key strategies available for Cook Inlet beluga recovery by creating more foraging opportunities for belugas in upper Cook Inlet. The results of a 2020 study by Norman et al. suggest that "reproductive success in [Cook Inlet belugas] is tied to salmon abundance" in the Deshka

River, which is also located in upper Cook Inlet near Knik Arm and the Eklutna River.[35] That study showed that "if salmon runs remained at their current levels, the [Cook Inlet beluga] population would likely continue its current slow decline," yet the study found that "if Chinook salmon increased 20% or more, the current decline would likely be reversed."[36] Furthermore, the study simulations found that "doubling the salmon abundance would be sufficient to allow recovery of the population regardless of impacts from other threats."[37] The study noted that while Chinook are the most nutritionally important salmon species for Cook Inlet belugas, belugas still rely on other salmon species as important prey.[38] Moreover, a recent 2023 study by McHuron et al. found that if there is enough prey available for Cook Inlet belugas, the whales can withstand other intermittent stressors, concluding that increasing prey availability increases the beluga's resiliency to threats.[39] Another recent 2023 study by Warlick et al. stated that "aerial survey data suggest that the [Cook Inlet beluga] population continues to decline[, and the] leading hypotheses include reduced prey availability […]."[40]

The proposed nominal flow releases from the AWWU Portal will only minimally enhance Chinook and coho salmon and their habitat in the lower Eklutna River. The AWWU Portal provides no solution for the complete blockage of salmon reaching the extensive lake spawning habitat required by sockeye salmon and miles of upper tributaries spawning habitat above the lake that is highly amenable to Chinook and coho salmon, both of which are primary forage species for Cook Inlet belugas.[41] Without connection to Eklutna Lake, protecting, mitigating, and enhancing those key spawning grounds and habitat is impossible. In turn, the mitigation and enhancement for Cook Inlet beluga whales are likely to be minimal as well. Furthermore, no analysis was completed for how the other alternatives considered would benefit Cook Inlet belugas. The Draft Program's severely inadequate analysis of non-salmonid fish and wildlife fails to meet the purposes of the Agreement and the standard of a similar federal process, and severely inhibits the Governor's ability to make an informed decision.

Conclusion

The Eklutna Project is the limiting factor preventing the restoration of the Eklutna River that flows from its headwaters to its confluence with the Knik Arm. Plainly, the Project Owners' Draft Program to continue to promote lack of connectivity of the ecosystem is inadequate to mitigate the Project's harms to fish and wildlife. Adequate and equitable fish and wildlife protection, mitigation, and enhancement, as required by the Agreement, requires the lake and upper tributary streams to be connected to the lower river and adequate flows for salmon to thrive. As such, we request that the Project Owners

Subject: Comment on Eklutna Hydroelectric Project
Date: Monday, February 19, 2024 6:36:52 PM

The Alaska Center
808 E St, Suite 100
Anchorage, AK 99501

To the Owners of the Eklutna Hydroelectric Project:

The Alaska Center is a 501(c)4 advocacy nonprofit organization, with over 50 years of history, based in Anchorage. We have tracked this mitigation process since 2019, in coalition with partners, including the Native Village of Eklutna and Trout Unlimited.

Our organizational vision is a thriving, just, and sustainable Alaska for future generations. In our view, the proposed Draft Fish and Wildlife Program is antithetical to that vision; it is unjust, unsustainable, and will fail to enhance the Eklutna River as is required by the 1991 Fish and Wildlife Agreement.

The Draft Program fails to acknowledge the needs of salmon; the proposed flows of 27 cfs in the winter and 40 in the summer are inadequate to bring back populations at even a fraction of what once existed. It is difficult to believe that a mere 3% of historic flows would be considered "mitigation and enhancement." This proposition is even more difficult to believe when compared to flows proposed by US Fish and Wildlife Service and National Marine Fisheries Service of 75 cfs in the winter and 160 in the summer. The fish deserve better, and an entire ecosystem that was once dependent on the vital nutrients provided by this keystone species deserves better. This proposition fails to rectify the harm done to the land for the last 100 years.

In addition to the flaws in the proposal itself, we have significant concerns about the process. As an advocacy organization, we care deeply about the ability of the public to comment on and be involved in decisions that directly affect us. One would hope that this mitigation process, which will lead to impacts on municipality taxes and utility rates, would encourage robust public participation. To be frank, we were shocked to learn that at the meetings, hosted by the owners group, the public comment would not be received in an open forum as is usually the case in such proceedings. It was only more disheartening to learn that the public felt so disregarded, that only 17 out of 230 attendees left comments.

Later in the process, we were heartbroken to learn that the utility companies signed a binding term sheet with the Anchorage Water and Wastewater Utility to use their portal in October 2023, prior to hearing the public's comments on the issue. Throughout this process, we have heard members of the public express that they wish to hear the sentiments of other member-owners on this issue. The public comment process did not allow for member-owners to hear each other, nor to hear directly from a party that is deeply impacted, The Native Village of Eklutna.

The Native Village of Eklutna has suffered immense harm as their river and fish were stolen from them in order to power Anchorage. Eklutna people have consistently helped Anchorage by providing land for schools and a power plant, and resources for the railroad. The Native

Village of Eklutna was not an original party to the dam agreement, nor are they a hydro owner–which is itself an injustice –but they are an important stakeholder in this mitigation process. The utility owners have consistently held meetings with the Native Village of Eklutna, and subsequently ignored their desires. The Native Village of Eklutna has consistently stated they want fish passage from the lake to the ocean. The mitigation process is a historic opportunity that should not be taken for granted. It is time for the utility owners and the community of Southcentral as a whole to take this crucial step toward righting a historic wrong of colonization.

Across the country, dams are being torn down as the harm they've inflicted upon the fish, land, and native peoples is being recognized. As Alaskans, we have an opportunity to right a grievous wrong and re-introduce a salmon run within upper Cook Inlet. We have an opportunity to protect the incredible natural resources within our state and prevent this land from being razed as it has in the Lower 48. We cannot fail our salmon as they have in Washington, Oregon, California, and Idaho. We need to do whatever we can to improve fisheries and give salmon the greatest chance of survival. This is a generational project. We cannot afford to think in the short term, as we have done for so long. There is an opportunity for fish to return, for our children and our grandchildren. The time is now. Renewable energy, salmon runs, and tribal sovereignty are not mutually exclusive. This river needs adequate flows and connection to the lake, morally and legally, and the proposed plan is insufficient to achieve these objectives.

Sincerely,

The Alaska Center

Chantal de Alcuaz

Co-Executive Director

CHUGACH STATE PARK CITIZEN ADVISORY BOARD

18620 Seward Hwy, Anchorage, AK 99516 Phone: 907-345-5014 Fax: 907-345-6982

Dear Eklutna Fish & Wildlife Program Development Team:

Municipality of Anchorage; Attn: Kolby Hickel
Chugach Electric Association; Attn: Andrew Laughlin
Matanuska Electric Association; Attn: Tony Zellers
McMillen Jacobs Associates; Attn: Samantha Owen
Hydro Regulatory Services; Attn: Steve Padula

The Chugach State Park Citizen Advisory Board (CAB) is a volunteer board composed of members of the public appointed by the Director of the Division of Parks & Outdoor Recreation. Among the CAB's purposes is a responsibility to "inquire into matters of community interest relating to State Parks and outdoor recreation". Furthermore, five primary purposes are outlined for Chugach State Park in statute (AS 41.21.120-41.21.125):

1. To protect and supply a satisfactory water supply for the use of the people.
2. To provide recreational opportunities for the people by providing areas for specified uses and constructing the necessary facilities in those areas.
3. To protect areas of unique and exceptional scenic value.
4. To provide areas for the public display of local wildlife.
5. To protect the existing wilderness characteristics of the easterly interior area.

We appreciate that the Program Development Team's mandate to select an alternative to fulfill the responsibilities of the 1991 Fish & Wildlife Agreement is an extremely complex task with a variety of implications for the Project Owners, Chugach State Park, the Native Village of Eklutna and the general public. The alternative implemented will have financial, cultural, recreational and environmental impacts for the next 35 years. While members of the CAB bring a diverse set of expertise and are personally sensitive to the wide array of potential implications of the various selected alternatives, as a board we remain focused on the potential impacts to Chugach State Park. Keeping both the CAB's purposes and the Park's purposes front of mind we respectfully submit the following comments on the 2023 Draft Fish and Wildlife Program.

We found the recreational study and subsequent discussion of impacts to recreation to be inadequate. While the recreational study did examine the *existing* quantity, frequency, location and type of recreation in the project area, it failed to sufficiently analyze how the park - and recreation - would be affected by the different alternatives. It also fails to account for future growth in recreation at Eklutna Lake over the project lifetime.

While both the Draft Summary of Study Results (Draft Study) and Draft Fish and Wildlife Program (Draft Program) acknowledge that substantial erosion has occurred to ~3.1 miles of the Eklutna Lakeside Trail - a direct result of the Project Owners' management of lake levels combined with wind caused wave action - there is no mention as to how to mitigate future trail damage. This mitigation is the responsibility of the Project Owners as laid out in the 1991 Agreement, and whichever alternative is selected should include a plan to

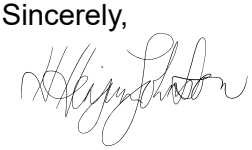
protect recreational assets such as the Lakeside Trail. Trail erosion primarily occurs at high lake levels when the lake is full (elevation 871 feet) and spilling via the ungated spillway, which has occurred 10 times since the dam was constructed in 1965 (Draft Program, Table 1-1, p.15). One infrastructure modification to the existing dam we encourage to be revisited is the fixed wheel gate. This would allow for more rapid drawdown of lake levels when the lake is full, preventing future damage to the Lakeside Trail. The fixed wheel gate also has the added benefit of allowing for increased channel maintenance flows, and is the preferred infrastructure modification to the existing dam favored by all entities except Alaska Division of Natural Resources and the Project Owners (Draft Program, Table 2-1, p.37-38).

The CAB is also concerned by the lack of specificity as to how the Project Owners will fulfill their obligation to contribute financially to needed repairs to recreation infrastructure. The Draft Study estimates the cost of Lakeside Trail Improvements to range from $860,000 to $3,441,000 (Table 2.9, p.60). However, the Draft Program abdicates responsibility for mitigation to trail damage by citing one time funding secured by a nonprofit partner (Section 3.3.2, p.57; Section 4.9 p.75). Unfortunately, the $234,000 in state capital funds approved by the legislature in 2023 represents a small fraction of the estimated repair costs and a very short term fix for only a limited section of dangerous, badly damaged trail. This does not absolve the Project Owners from the obligation to develop a long term logistic and financial plan to repair the remainder of trail damage (as identified in the Draft Study, Section 2.11, p.53), prevent future damage, and maintain the integrity of trails and infrastructure in the future. Furthermore, there is a rather large discrepancy between estimated cost cited in the Draft Study referenced above versus the Draft Program. The total median cost cited in the Draft Program (Appendix D, Table 2-1) was $1,347,100 less than that cited in the study results. This discrepancy should be reconciled.

While we acknowledge that the Project Owners are bound by the schedule laid out in the 1991 Agreement, multiple partners, including the Anchorage Assembly, have called for a delay to allow for time to better consider all alternatives. A delay would also allow the Project Owners to fully consider the dam removal alternative supported by the Eklutna Valley Community Council and the Native Village of Eklutna. The CAB supports a delay to allow the Project Owners and all interested parties to better analyze this option. With a 35-year implementation timeline, all parties will have to deal with the consequences of the selected alternative for decades to come.

Regardless of the alternative selected, the CAB expects the Project Owners to develop a plan to mitigate impacts to any recreational assets including, but not limited to, damage to the Eklutna Lakeside Trail. Additionally, in partnership with Chugach State Park and nonprofit partners, the Project Owners should establish an agreement and a corresponding fund to pay for assessments and repairs of existing and potential future damage to recreational assets over the lifetime of the project. The CAB recommends that the Project Owners make regular contributions to an approved financial vehicle equal to - at a minimum - the median estimated cost of trail repairs cited in the Draft Study. This financial burden should not be passed off to Chugach State Park, the State of Alaska or other nonprofit partners as it has in the past.

Sincerely,



Haley Johnston, Board Chair
Chugach State Park Citizen Advisory Board

Re: Support of Eklutna Salmon and a Free-Flowing Eklutna River

Dear Decision-Makers,

I am a resident of Upper Cook Inlet and an MEA ratepayer. I strongly believe that fish passage should be restored on Eklutna River all the way to Eklutna Lake and beyond. The Native Village of Eklutna, the National Marine Fisheries Service and the US Fish and Wildlife Service all have encouraged actions toward the implementation of a restored Eklutna River.

I fully support the Native Village of Eklutna's vision for Eklutna Watershed:

- The Eklutna River running freely, continuously, and naturally from its glacial headwaters through its dramatic canyon and its productive estuary to the marine waters of Cook Inlet.
- All five species of Pacific salmon (King, sockeye, silver, pink & chum) again swimming freely from Knik Arm through the entire length of the Eklutna River to their spawning grounds at Eklutna Lake.
- An abundant salmon fishery that supports the Eklutna Dena'ina and the people of Southcentral Alaska.
- Eklutna Lake, centerpiece of Chugach State Park, full to its natural lake level to support sockeye salmon shore spawning and human-powered recreation.
- An Eklutna River that rebalances the needs of fish, the Eklutna Dena'ina, drinking water for Anchorage, and low-carbon power production.

I fully support the comments and position of the Native Village of Eklutna (NVE) as presented in their December 4, 2023 comments on the Chugach Electric Association, Matanuska Electric Association, and Municipality of Anchorage ("Project Owners")'s Eklutna Hydroelectric Project Draft Fish and Wildlife Program. NVE's letter clearly presents the biased inadequacies of the Draft Program. The comments by NVE, the National Marine Fisheries Service and the US Fish and Wildlife Service all point out that the Draft Program fails to meet the fundamental purpose of the 1991 Eklutna Fish and Wildlife Agreement.

Please restore fish passage to Eklutna River to support salmon and other fish and wildlife, including Cook Inlet Beluga Whales.

Sincerely,
Jessica Winnestaffer

To Whom It May Concern,

I am writing to express my strong opposition to the proposal known as the "AWWU Portal," put forth by the group identified as The Owners. This proposition, aimed at mitigating the Eklutna River, is insufficient and fails to address the critical needs of the river's ecosystem, particularly concerning the thriving of all five species of salmon that historically inhabited those waters.

The 1991 agreement, to my understanding, was established with the intent of preserving the Eklutna River's ecosystem in a manner that mirrors its natural state as closely as possible. The proposal in question deviates significantly from this intention, offering a solution that undermines the ecological and cultural heritage of the area. The reliance on the AWWU Portal as a mitigation strategy overlooks the importance of maintaining a balanced and diverse salmon population, which is essential not only for the ecosystem but also for the cultural fabric of our community.

It is indeed challenging to provide concrete evidence of the species present in the Eklutna River prior to its current state. However, the oral histories and faithful stories passed down by the indigenous people of this region offer invaluable insights into the river's original biodiversity. These narratives highlight the presence and significance of all five salmon species, underscoring the importance of restoring the Eklutna River to a state that supports their lifecycle and migration.

Furthermore, the economic implications of a river ecosystem rich in salmon cannot be overstated. The Kenai River, with its abundant sockeye salmon population, serves as a vivid example of how such ecosystems can become economic staples for their communities. It showcases the potential economic benefits that could be realized in Anchorage by emulating a similar focus on ecosystem health and salmon population support.

In addition to the ecological and economic benefits, the construction of a new dam with an effective fish passage represents a viable alternative that aligns more closely with the goals of the 1991 agreement. Such an infrastructure project would not only facilitate the migration and repopulation of all salmon species but also stimulate our local economy by creating job opportunities. This approach offers a holistic solution that respects our environmental, cultural, and economic needs.

I firmly believe that the AWWU Portal proposal falls short of the comprehensive and sustainable solution required to restore the Eklutna River to its natural glory. It is imperative that we explore alternatives that prioritize the return and flourishing of all five salmon species, thereby honoring the legacy of our indigenous communities and securing a prosperous future for Anchorage.

I urge you to reconsider the current proposal and to seek a path forward that truly reflects the original spirit of the 1991 agreement. Let us commit to a solution that fosters a thriving ecosystem, respects our cultural heritage, and leverages the economic potential of our natural resources.

Thank you for your attention to this matter.

Sincerely,

Kyle Foster

To: Sam Owen
Subject: comment on the draft Fish and Wildlife Program
Date: Monday, February 19, 2024 7:21:29 PM

Dear Project Owners,

Thank you for the opportunity to comment on the draft Fish and Wildlife Program, prepared in response to the 1991 agreement, when you became co-owners of the Eklutna Project.

I do not believe this draft Program accords with the terms of the agreement and I urge you to expand the suite of considered alternatives and reevaluate the adequacy of the draft Program. It does not fully quantify the impacts of the project on fish and therefore the mitigation measures do not fully address these impacts.

1. Need for a FERC license. The 1991 agreement was put in place to "...obviate the need for the Eklutna Purchaser and AEA to obtain FERC licenses." This implies that the fish and wildlife protections should accord at least what a FERC license would require. The federal owner got out of its obligation and shifted it to you, the co-owners. We, who have benefited from the project, got a sweet deal for 35 years. Now the piper needs to be paid. That is, proper measures that would be required under a FERC license for this project must be put in place.

The Eklutna hydropower project has dried up 11 miles of Eklutna River for at least 60 years. Apparently there is no baseline for conditions before the dam(s) were built. This does not mean that the present situation serves as baseline or even that the condition with the lower dam (since removed) in place served as baseline. The agreement says the Fish and Wildlife Program shall consist of measures for the protection, mitigation of damages to, and enhancement of fish (including relating to spawning grounds). You should **look seriously at the comments from NOAA and USFWS for guidance on changes to the Fish and Wildlife Program that will satisfy the FERC requirements** for hydropower project licensing.

In parts of the lower 48 states, hydroelectric dams have been removed because satisfying the FERC relicensing requirements is too onerous. That seems to be exactly the case here.

2. Condition of the hydropower plant itself. The draft Program proposes a $44 million investment at the intake to the penstock to continue hydropower production at the 60-year old plant. The plant supplies a minor percentage of electricity for Chugach and MEA customers. Given that Eklutna hydropower only accounts for 3% of the power supplied by Chugach Electric, this project does not represent a large share of the power supply. **What is the condition of the power plant and does it warrant such an investment for the small percentage of power it supplies**? Does the plant itself need improvements and, if so, what is the price tag for those? Can that money be better spent on renewable sources that do not depend on continued dewatering of formerly productive salmon habitat?

3. Anchorage's potable water supply. Recent comments by AWWU and by the Assembly's consultant indicated that effects of the draft Program on Anchorage's water supply from Eklutna Lake have not been fully considered. It appears that AWWU built its water treatment plant intake pipeline in the river bed, sometime in the same time period that the sale of the power plant to the owners was being negotiated (1988-1989, according to the timeline in the January public meeting presentation). If this pipeline was not constructed to consider different future conditions (e.g.,protection for scour from streamflows and at-grade crossing rather than bridges), then what kind of agreement was actually made with the owner and AWWU? Even if restoring flows in the riverbed where the pipeline was buried was not considered in the design, that does not seem to be an adequate reason not to consider rewatering the river bed. The geomorphologist consultant at the Public Meeting in Anchorage specifically told me that they were only asked to evaluate the geomorphic effects of certain (those currently proposed) flows (e.g, not historic or higher flows) and also that they did not evaluate potential depth of scour for any flows. This suggests that the full range of flows or impacts on the pipeline has not been considered, even though there was a comment on an earlier study from a former AWWU general manager specifically addressing a concern about the effects of scour. Apparently we can only wring our hands and say the pipeline will be washed out, without evaluating the likelihood of and costs to prevent this. Finally, **what are the content and conditions of the most recent agreement between the owners and AWWU** that has not been made public and was the subject of a recent executive session of the Municipal assembly?

4. Obligations to Indigenous peoples and complicity with past injustices. I have been a rate payer to ML&P, and subsequently a Chugach Electric member, since 1994. **I have benefited from low electricity rates and I deeply resent being complicit in this project.**

Touting the Eklutna hydropower plant as an example of Chugach's renewable energy sources disregards the detrimental effects of the plant on the environment. It completely ignores the fact that the federal government has not adequately compensated the Eklutna tribe and gave the benefit of the stolen goods to the current owners and their customers. As a rate payer and member of the Chugach Electric cooperative, as well as a rate payer and consumer of water supplied by AWWU, I believe that the owners have an obligation to the inhabitants at the time the dam was constructed and the water diverted, and to their descendents, to correct 90 years of benefiting from trespass.

5. Take a pause. **Seriously consider and honor the proposition offered by The Native Village of Eklutna** in its December 4, 2023, letter commenting on the draft Program. This is a generous deal to the owners, allowing them time to develop alternative electric power sources and better evaluate the best use of the $44 million of investment suggested by the draft Program. Given the looming gas shortage for electrical generation and the urgent need to develop new energy sources for generating facilities, this has to happen anyway.

Sincerely,

Margaret Langdon

NATIVE MOVEMENT
Building Healthy & Sustainable Communities
www.nativemovement.org

February 19, 2024

Chugach Electric Association, Inc.
Matanuska Electric Association, Inc.
Municipality of Anchorage

RE: October 2023, Eklutna Hydroelectric Project, Draft Fish and Wildlife Program

Submitted via: info@eklutnahydro.com

Native Movement[1] is pleased to offer comment on the October 2023 Eklutna Hydroelectric Project, Draft Fish and Wildlife Program. Native Movement is an organization dedicated to building people power rooted in an Indigenized worldview. Our mission is to foster healthy, sustainable, and just communities for all, with a particular emphasis on upholding social justice, Indigenous Peoples' rights, and the rights of Mother Earth. At Native Movement, we prioritize grassroots-led projects that align with our vision and values. We recognize the interconnectedness of environmental stewardship, cultural preservation, and social equity. It is within this framework that we engage in efforts to protect and restore our natural environment, promote traditional knowledge, and advocate for policies that prioritize the well-being of both present and future generations.

Native Movement stands with the Native Village of Eklutna, local community councils, and others who support the restoration of the Eklutna Lake and River ecosystem.

Proposed Eklutna River Flows
The Project Owners are proposing to release year-round instream flows of 27 cfs in the winter and 40 cfs in the summer from Eklutna Lake into Eklutna River from a new Eklutna River Release Facility which will be located adjacent to the AWWU portal valve. The Project Owners claim this will water 11 of 12 miles of the Eklutna River.

Native Movement concurs with growing public sentiment that a stream flow rate of between 27 to 40 cfs is marginal, and whether a flow rate of between 27 to 40 cfs is adequate would likely depend on many factors that would have to work in unison. Some species of salmon may be more adaptable to lower flow rates than others. Species like pink salmon or chum salmon might

[1] https://www.nativemovement.org/what-we-do

be more tolerant of lower flow conditions compared to species like Chinook or Coho salmon. At the proposed marginal flow rate it seems the quality of the water would be very critical for salmon survival and reproduction. Even if the flow rate is suitable, the water must have adequate oxygen levels, be free from pollutants, and maintain appropriate temperatures that salmon prefer. Flows between 27 to 40 cfs may be sufficient for some aspects of salmon habitat, such as migration corridors or summer rearing habitat, but it may not provide enough space or suitable conditions for all life stages, especially spawning habitat. Salmon require a variety of habitats throughout their life cycle, such as riffles, pools, and areas with suitable substrate for spawning. It is possible the proposed flows of between 27 to 40 cfs may only allow for limited stream habitat types.

Removing the Eklutna Dam

Native Movement is convinced that full restoration is consistent with the existing 1991 agreement. If the Tribe and the public demand justice for restoration, then it seems reasonable and consistent with the 1991 agreement to consider full restoration. The relevant language of the 1991 agreement is as follows: *"protection, mitigation of damages to, and enhancement of fish and wildlife (including related spawning grounds and habitat) affected by hydroelectric development."*

The statements "*protection, mitigation of damages to, and enhancement of fish and wildlife (including related spawning grounds and habitat) affected by hydroelectric development*" should not exclude restoration because each component–protection, mitigation, and enhancement–contributes comprehensively to fish and wildlife populations and their habitats. Each component—protection, mitigation, and enhancement—addresses different aspects of managing the impacts of hydroelectric development on fish and wildlife; they collectively can easily contribute to the broader goal of restoration. By integrating these components into a strategy, it becomes clear that recovering and restoring fish and wildlife populations and their habitats affected by hydroelectric development is inclusive of full restoration.

Water Rights

The Project Owners have claimed that their Priority of Appropriation gives them a superior claim to water over other users who value a restored Eklutna River ecosystem. Native Movement is not convinced the Project Owners have the right to prevent changes in the condition of water occurrence if the will is to restore an intact Eklutna River ecosystem. Native Movement believes it is within the rights of the Tribe and the public to propose appropriation of water rights for the Eklutna River ecosystem, and the Project Owners cannot prevent subsequent generations from securing water for fish and wildlife. The law may uphold the priority of appropriation principle. However, subsequent appropriators could be allowed to reasonably access water for fish and wildlife even if it means the prior appropriator may need to adapt to the new circumstances or if the will of the public demands water rights be relinquished to benefit fish and wildlife.

1991 Fish and Wildlife Agreement
The Project Owners are claiming the 1991 Agreement is the guiding document they have followed during development of the draft fish and wildlife program. The Project Owners also claim to have fully met the procedural and schedule requirements of the 1991 Agreement. They go on further to say: "The Project Owners have gone well beyond the requirements of the 1991 Agreement in terms of consultation, documentation, and analysis of Draft Program alternatives." However, the Draft Fish and Wildlife Program puts forth one alternative and rejects many others. During the January 2024 public hearings in Eagle River, it was noted that a dam removal analysis option would be drafted after the comment period closed.

By considering only one alternative in the Draft Fish and Wildlife Program and rejecting many others, there is a lack of transparency in the decision-making process. This has an impact on public trust by giving the impression that decisions are made without considering diverse perspectives or fully informing the public about available options. By compiling a dam removal analysis option after the comment period closes, the Project Owners are excluding a significant alternative after the public input phase, and that creates the perception that decision-makers are not genuinely interested in hearing and incorporating public feedback or exploring all viable options.

Sockeye Salmon
The Project Owners have claimed: "*that no adult sockeye were observed spawning in the lower river during the 2-year study program. Therefore, any attempt to establish a sockeye salmon run in the Eklutna watershed would either rely on sockeye straying from other river systems or intentional stocking efforts.*"

This statement casts doubt on traditional ecological knowledge (TEK) and the potential for sockeye salmon to thrive in the Eklutna watershed. The Project Owners seem to be suggesting that since no adult sockeye were observed spawning during a two-year study program, the dream of witnessing these majestic fish returning home to their ancestral waters seems bleak. However, Tribal Administrator Brenda Hewitt testified at a House Energy Committee hearing on February 8 that the Tribe in fact had seen and tagged sockeye salmon on the river in the last year. She further testified that the Tribe had informed the project owners of their findings, indicating that project owners are either ignoring or actively hiding information contrary to their conclusions. Even if sockeye had not been recently documented in the river, that would not mean that sockeye could not return. Nature has a way of surprising us, and Native Movement is convinced of the TEK already put forth, that once there was enough salmon that one could walk across their backs. It's crucial to remember that the absence of evidence is not evidence of absence. We also must not overlook the prospect of sockeye straying from neighboring river systems. Salmon are nature's wanderers, after all salmon embark on a journey out to Cook Inlet to who knows where, venturing far from their natal stream.

Lack of Free, Prior and Informed Consent, or Even Meaningful Consultation with the Tribe
The Eklutna Tribe has been stewarding the Eklutna River for generations. The original dams were built without the Tribe's input or consent, and they have been devastating to the Tribe's

ability to fish. It is time to stop trampling the rights of the sovereign Eklutna people. Any proposal for the Eklutna Hydro project can only move forward with the free, prior, and informed consent of the Tribe. This process has been none of those. The Tribe does not consent to the proposal. It has not been given the opportunity to work meaningfully with the decisionmakers prior to the utilities publishing a proposal. And the Project Owners have actively worked to hide information from the Tribe and the public. In fact, although the Project Owners claim to have consulted with the Tribe, they have rejected the Tribe's input at every turn and worked to silence the Tribe's voice. They barred the Tribe from speaking at the public hearings and did not invite the Tribe to speak at a recent legislative hearing on the project. There is no free, prior, and informed consent for the project proposal; there is not even real consultation.

Inadequate Public Process

In addition to ignoring the Eklutna Tribe's rights, the Project Owners have not provided adequate public process. In the meetings that were advertised as public hearings, the Project Owners did not allow time for public testimony. Instead, they only allowed the public, including members of the Eklutna Tribe, to submit comments in the back of the room. Across all 6 public meetings, only 17 out of 230 attendees submitted written comments. Many attendees were disappointed to not hear what others in the room thought. The utilities themselves gave a presentation that left out important information and included slanted information. They had McMillen Inc. scientists and engineers available after the presentation to answer questions. However, there were no tables for other experts and parties to the 1991 Agreement, including Native Village of Eklutna, the US Fish and Wildlife Service, or the National Marine Fisheries Service.

Moreover, in putting forward only one alternative, the Project Owners have not provided an adequate basis for the public to weigh in. With the tight timeline that the Project Owners have put themselves on, there is no time for the public to fully develop and analyze a new alternative. The Project Owners should have fully analyzed multiple alternatives, including the Tribe's preferred alternative. Without valid alternatives to consider, the public is hindered in its ability to weigh in meaningfully. Therefore, we support the Anchorage Assembly's request for a two-year pause to complete additional analysis of true river protection, enhancement, and restoration alternatives.

We were also disheartened to learn during a recent special Assembly meeting that a binding agreement between AWWU and the Project Owners to implement the portal alternative was signed prior to the public process and any resolution of differences amongst the Parties to the Agreement. According to the 1991 Agreement, any documents related to the Agreement process should be made available to the public upon request. When the Assembly requested a copy of that agreement, their inquiry was denied, further demonstrating the disingenuous nature of the purported public process.

Conclusion

The Project Owners seem to be suggesting a sense of finality that law and agreements are on their side and their draft fish and wildlife program has met all the requirements. The journey to

establish salmon in the Eklutna watershed may be fraught with challenges, but it is also filled with hope. The first people of Eklutna whose lands were taken from them without consideration for this hydroelectric project deserve to have their voices heard, and all Alaskans deserve to have Eklutna River restoration looked at as a viable alternative.

Thank you for your time and consideration.

Sincerely,

Austin Ahmasuk

From:	Sarah Cronick
To:	Sam Owen
Subject:	Strongly oppose the Eklutna Draft Fish and Wildlife Program
Date:	Monday, February 19, 2024 12:40:56 PM

Greetings:

I am a born and raised Alaskan who currently resides in Anchorage. I am a paying member of Chugach Electric Cooperative and Municipal Light and Power.

I am writing today to express my strong opposition to the current draft for the Eklutna Fish and Wildlife Program.

I have attended the public meetings to become engaged and learn more, from all involved parties. I keep up with articles published, and read between the lines.

This plan is not backed up with substantiated evidence. It is based on unsubstantiated claims, assumptions, and desires of a few. It does not support the return and survival for not only King Salmon, but all salmon species. The proposed CFS flow rates are not sufficient to support the survival of these fish.

Closed door contracts and an unwillingness to be transparent with the public is a tremendous red flag.

This plan does not include well-rounded data and perspectives of all involved parties. It favors the utility companies, and does nothing to repair relationships with the Eklutna People. It also does not consider other renewable energy options; in fact, there have been reasonable requests made from renewable interests that are met with a clear "no."

What kind of thinking would limit all perspectives? We can do so much better.

It is heartbreaking to learn that utility leaders are serving only certain, short-term interests, rather than looking at the long term needs.

Please consider the young ones, and future generations to come. What is in their best interest? Proceed from there.

Again, I STRONGLY OPPOSE the current plan and am deeply dismayed with the process led by the utilities.

I look forward to hearing how you will do better to be more transparent, clear, and factual moving forward.

Warm regards,
Sarah Cronick (she/her)

CAUTION: This email was received from an external source

THE POWER COMPANIES WANT YOU TO BELIEVE THAT WE MUST SACRIFICE SALMON TO SAVE THE PLANET. THAT IS A FALSE CHOICE.

iT IS POSSIBLE TO HAVE HYDROPOWER THAT DOES NOT KILL SALMON. THAT MEANS GIVING THEM ENOUGH WATER AND ALLOWING THEM TO REACH THEIR SPAWNING GROUNDS. tHE PLAN PROPOSED BY THE POWER COMPANIES AT EKLUTNA FAILS ON BOTH COUNTS. tHE POWER COMPANIES PROPOSE TO DELIVER A TRICKLE OF WATER VIA A SPIGOT THAT CREATES A DEAD-END RIVER, LEAVES A DRY RIVERBED FOR ONE MILE, AND REQUIRES SALMON TO WALK TO THEIR SPAWNING GROUNDS IN EKLUTNA LAKE.
tHE POWER COMPANIES' PLAN ALSO WOULD JEOPARDIZE THE ANCHORAGE DRINKING WATER SYSTEM.

THE ORIGINAL IMPACT, 93 YEARS AGO, WAS THE LOSS OF A SOCKEYE SALMON RUN TO EKLUTNA LAKE. THE RETURN OF THAT SOCKEYE RUN WOULD BE A BOON TO SOUTHCENTRAL ALASKA. BUT IF WE LET THE POWER COMPANIES HAVE THEIR WAY NOW WE WON'T GET ANOTHER CHANCE FOR 35 MORE YEARS.

THE POWER COMPANIES ARE PEDDLING FEAR OF CLIMATE CHAOS, DWINDLING GAS SUPPLIES AND RISING ELECTRIC RATES. ALASKANS ARE SMART ENOUGH TO SEE THROUGH THIS SMOKESCREEN.

RATHER THAN RUSH TO SPEND $60 MILLION NOW TO BUILD A FLAWED AND RISKY GUTTER THAT KILLS SALMON, WE PROPOSE WAITING TO DO THE JOB RIGHT ONCE RENEWABLE ENERGY SOURCES COME ON-LINE TO REPLACE EKLUTNA HYDRO. THEIR PLAN WOULD REDUCE EKLUTNA HYDROPOWER NOW, RAISE YOUR RATES NOW AND FAIL TO HELP SALMON. OUR PLAN WOULD HAVE NO IMPACT ON RENEWABLE ENERGY, HAVE NO IMPACT ON RATEPAYERS, AND WOULD RESTORE THE EKLUTNA RIVER AND ITS SALMON.

SALMON ARE THE ULTIMATE RENEWABLE RESOURCE IN ALASKA. IF WE GET OUT OF THEIR WAY, THEY KEEP COMING BACK TO US.

Date: Friday, January 12, 2024 2:21:02 PM

As solicited, here are my comments about the Eklutna hydroproject.
Remove the Eklutna dam and return salmon to the Eklutna River. This is a critical opportunity to bring salmon back and protect the resource into the future. Salmon need access to Eklutna Lake and its upper tributaries.
One can't put a price on the salmon resource. Any issues with increasing rates for energy in the future can be dealt with via renewable resources and technology. Humans are intelligent and can figure this out. The salmon should be the priority.

I am in favor of removing the dam.

It has been a long time since salmon made their way up the Eklutna.

In the long run, removing the dam is the right thing to do for the Eklutna people, for public/park users, and for the fish.

It may be a much more costly alternative now, but it will not get less expensive in the future. And these salmon are a natural resource in the public trust that will continue to migrate up the Eklutna and spawn long into the future if the dam is removed.

I support the community alternative. I don't understand why the utilities want to spend $57 million on infrastructure that won't even fix the fish situation halted nearly a century ago. Take the dam down. Provide clean drinking water to Anchorage without harming the water utility.
I would have supported a revised dam with a fish ladder but the utilities didn't put that forward as an option. I hope Governor Dunleavy can fix that or take the dam out.

My name is Kenn Moon. I first came to Alaska as a pilot with the Air Force in the 1950's, homesteaded in the 1960's and have seen many ecological changes
Since. Almost all them bad. The opportunity we have now to open up and restore the Eklutna River and lake to its natural state seems
Almost miraculous to me. We as humans don't often have a chance to correct the errors of the past. We do now and should seize it!
Do the right thing. Take down the dam at the lake, Open up the full flow of water to the Eklutna River. Bring back the fish !

I support the Native Village of Eklutna's Community Alternative Plan. The Restoration of the Eklutna River is more than a litmus test for the project owners, it is a socio-economics moral imperative for the entire Alaskan Community. If this small river cannot be fully restored what hope do we have of restoring the largest loss of wildlife resource in this nations history. Alaska was documented as the least productive wildlife harvest state in the nation in 2004. Since then it is now known that 90% of the moose harvest is gone in the lifetime of this hydro project. It's gone because bears lost their salmon and turned to moose calves. If this lesson of restoring salmon cannot be learned within walking distance of the states largest city then there all is lost. The policies responsible for the loss of salmon on the Eklutna River are also the policies responsible for the loss of salmon statewide.

Date:	Wednesday, January 17, 2024 3:42:56 PM

Dear Owners of The Eklutna Hydroelectric Project,

Hello,

Chugach Electric, Matanuska Electric, and the Municipality of Anchorage need to adopt the vision for the Eklutna River endorsed by the Village of Eklutna and Eklutna Inc. The vision demands a level of restoration that allows for the habitat of all five species of Pacific salmon. Chugach's preferred alternative will leave a segment of the Eklutna River dry. This will inhibit the return of sockeye salmon as they require lake habitat to spawn. This proposed plan is not in line with the Village of Eklutna and Eklutna Inc.'s vision for the river or the 1991 Fish and Wildlife Agreement, which mandates that the utilities must mitigate their impacts on sockeye salmon and their spawning grounds.

We have an opportunity to completely restore the Eklutna River and a food source for the Eklutna people. I'm very supportive of cheap and renewable energy, but keeping the damn intact is not worth the social and cultural cost. Across the country, utilities, localities and states are recognizing the harm of forced damning of cultural significance waterways and are starting to completely remove damns. The Klamath River damn removal started just the other week and it was announced 4 damns on the Lower Snake River will be removed. This is the moment to write an enormous historical wrong. Please don't fall short. Restore the entire Eklutna River.

Sincerely,
Bennett Norman

Audio Recording Transcription of Chantal de Alcuaz

January 17, 2024, 2:00-4:00pm, Arctic Center, Anchorage AK

“My name is Chantal de Alcuaz and I live here in Anchorage, Alaska. I'm a CEA Chugach Electric Association ratepayer. Before I talk about the proposal, I just want to start by saying that I think the structure of these meetings is very disappointing. We started with the presentation by a contractor who works for the owners group without any opportunity for other perspectives or rebuttal, even from the Native Village. And now the public is separated for their submission of testimony, so that they can't hear what each other is saying. And I fear that the format was deliberately designed to obscure the growing consensus that the restoration plan presented today is, at best insufficient and at worst unjust. So, to get to the matter at hand outside of the meeting format, I'd like to express my disappointment about the “AWWU Portal Option” and conversely, my passionate support for the community alternative of specifically complete dam removal once other sources of renewable energy have been secured. For years now, my own utility, Chugach Electric Association, has been disappointingly reluctant to add renewable energy to the grid. Now it is using the loss of a relatively small amount of renewable power, approximately 3% of its total production, I'm told, and subsequent rate hikes as its rationale for this inadequate plan. I believe that pitting salmon against renewable energy is a false choice that we don't have to make, and I believe that no amount of money saved, or costs avoided can justify perpetuating the shameful legacy of colonization. Unlike the AWWU Portal Plan, the community alternative would create a continuous flow of water from the lake to the ocean for the restoration of all five species of salmon, as well as for the fish to return to the miles and miles of tributaries above the lake. We have a very generous commitment from the nonprofit groups to remove the dam, so that the ratepayers and taxpayers will not have to bear the cost of dam removal. And most importantly, we have a historic opportunity to restore salmon and to right a wrong that the Eklutna people have now borne for generations. I sincerely hope that the powers that be come to their senses so that we won't squander the opportunity. Thanks for the time.”

Date: Wednesday, January 17, 2024 9:41:47 PM

Dear operators,

I strongly oppose the draft Fish and Wildlife plan that was proposed for the Eklutna River that leaves a mile of the river dry, fails to provide fish passage to critical habitat, and is contrary to the wishes of the Indigenous People of Eklutna.

As a recreational angler, I know the importance of intact habitat and healthy streams. As the region continues to grow in population size, a thriving and fish-filled Eklutna River can help meet the needs of increased use of our local fisheries. On top of fishing, I visit the Eklutna area as a runner, skier and paddler; I often bring visitors to Eklutna to show them an iconic Southcenral Alaska location. I want to be able to speak to the health of the fishery when I bring them here instead of showing a dried out river.

Additionally, the Native Village of Eklutna has clearly communicated its vision for thriving wild salmon in the Eklutna River and adjacent waters. We have a responsibility to honor the wishes of the original stewards of this land, who have kept Eklutna the incredible place that it has been for generations.

Please remove the Eklutna Dam, fully reconnect the river, and return the water flows needed to support the fishery.

Sincerely,
Meghan Barker

I went to your presentation on 1/17/24 @ Artic Rec center. As I can see you have shown no Good will toward your customers. It was CLEARLY a one sided presentation. Plenty of money has been spent on the "owners" side when it could have been doing something useful. You didn' t have to pay for the removal of the lower dam. Now all you have to do is remove the rest of the dam. With the help of other groups to help fund it. You are afraid to give up your control. There is no SHORTAGE of water in Alaska. Your evaluation to send a trickle of water down the river will not restore the salmon to the lake.
Please remove the dam coming from the lake and make the Ekluna a free flowing river. Thank you

J Schoen comments on the draft fish and wildlife plan for the eklutna Dam

I have lived in Alaska for 47 years and have been an Anchorage resident for over 30 years. I am a wildlife ecologist and have spent much of my professional career working on wildlife conservation issues throughout the state. I do not believe that the proposed Eklutna plan adequately address the ecological requirements of salmon, the vision and needs of the Eklutna people, or the legal responsibilities to mitigate the Eklutna project's ecological impacts to fish and wildlife resources in the Eklutna Watershed.

The Eklutna River must be re-connected to Eklutna Lake to ensure fish passage and restoration of the river's coho, chinook, and sockeye salmon. The proposed plan will leave one mile of the river dry and only release 3% of historic water flows. This will not allow fish passage into the lake and its upstream habitat. Salmon populations will not recover without a reliable and consistent supply of water and access to important up-stream spawning and rearing areas. I do not believe that the Chugach Electric Association, Matanuska Electric Association, or Municipality of Anchorage can meet their mitigation obligations within their budget constraints with anything less than removal of the dam. Therefore, I strongly recommend that the Eklutna Dam be removed to restore water flows required to support the Eklutna fisheries.

I recognize and appreciate the region's current reliance on the Eklutna hydroelectric energy source. However, it seems reasonable to remove the Eklutna dam within the next decade, when replacement renewable energy is expected to be available. I also understand that community partners are willing to assist in offsetting the costs of dam removal. Thus, this cost-sharing opportunity will be a fiscally responsible decision. Electric ratepayers and many Anchorage citizens support this vision that is also shared by the Eklutna people who have depended upon this salmon fishery for millennia.

In conclusion, I strongly recommend that the Eklutna Dam be removed to restore water flows required to support and sustain the Eklutna ecosystem and its important fisheries for the benefit of current and future generations.

Thank you for considering my comments.

Sincerely,

John W. Schoen, Ph.D.
Wildlife Ecologist, retired

Subject: Eklutna Draft Fish and Wildlife Program Comment
Date: Thursday, January 18, 2024 1:08:21 PM

After reading and listening to the proposed solutions for Eklutna Lake it appears that we are missing an obvious solution.

As it is now, there are two sides in this debate. The side that wants to open up the entire Eklutna drainage to salmon, and the side that wants to keep the existing hydro project operational.

Except for its effect on salmon migration, the Eklutna Hydroelectric project is a gem. Producing enough greenhouse gas free renewable energy to power 25,000 homes. Of equal importance, the lake reservoir stores electrical power, it is essentially a massive battery, that can be used to quickly meet daily power demand fluctuations. This is exactly what is needed to integrate other renewables such as wind and solar energy into our electrical grid.

Restoring salmon to the Eklutna River is a laudable goal, but at a time when we are facing an existential climate crisis, we must do all we can to reduce use of fossil fuel. The Eklutna Hydroelectric Project has a critical role to play in our low carbon future and should not be removed until we have turned around our climate.

Apparently, there is a 1991 document that says something must be done. So, an alternative is proposed to spend $57M to put in a valve to release some flow into the river. This alternative satisfies no one. It does not significantly restore salmon, it stresses our critical water supply infrastructure, and it is a waste of ratepayer money.

The obvious solution is to rewrite the agreement. Do nothing now. Put a subsidy on each kilowatt hour of Eklutna generated power that will go into a dedicated fund to remove the project in the future. And designate this time in the future to be when there is either a surplus of renewable energy or the project reaches its usable life. The $57M would be much better spent as the seed money for this fund.

An agreement is only as binding as the parties involved agree to. Let’s go back to the table and come up with a solution that works for all. Things are different now than when that original document was written. Climate change was an unknown. We need to acknowledge this. The salmon will wait.

From:	Valanne Glooschenko
To:	Sam Owen
Subject:	Comment re: the Draft Fish and Wildlife Plan
Date:	Thursday, January 18, 2024 2:34:31 PM

Please note that I support restoration of the Eklutna River and the historic salmon runs, as currently proposed by the Native Village of Eklutna and partner organizations.

The Native Village of Eklutna plan proposes a reasonable time line of a decade when replacement renewable sources of energy are expected to be available. In addition, two nonprofit community partners have agreed to source funds for the dam removal.

I reject the draft Fish and Wildlife Plan now up for public review by supporters of the Eklutna Hydroelectric Project.

That draft plan would only restore 3% of water back to the river. And in addition prevent salmon from accessing critical habitat in and around Eklutna Lake and its upstream tributaries.

Sincerely,

Valanne Glooschenko, M Sc.,

As a permanent multi-decade resident and Eklutna Valley homeowner, I support the full restoration of the Eklutna River and its former salmon run. Anchorage energy producers have a legal and moral responsibility to return the salmon they destroyed in 1928.

For nearly 100 years local energy producers have enjoyed unfettered financial benefits from Eklutna River and Eklutna Lake without regard to the financial and cultural loss to this historical fishery. It is long past due for the State of Alaska to help restore this watershed, and take full responsibility for the destruction of this significant public resource.

Comments on the Draft Fish and Wildlife Program's preferred alternative

The electrical producers and Municipality of Anchorage signed a contract in 1991 wherein they agreed to restore fish populations and other ecosystem functions and values lost when two dams were built on the Eklutna River in 1928.

The draft program contains some good field research but it missed at least one major issue. Eklutna Lake is a glacial lake with very cold water. In a lake, the warmest water tends to rise to the surface and the coldest tends to sink to the bottom. In a natural system, it is the warmest water that flows out of the lake and into the river. But if the preferred alternative is chosen, the AWWU pipeline will be the source of the river's water. The intake structure is on the lake's bottom. The colder water flowing into the river from the AWWU pipe will limit production of some aquatic invertebrate populations (fish food), retard fish growth rates, and affect survival of eggs and fry by freezing sooner than water that would have flowed out of the lake naturally. The final fish and wildlife program should consider the potential impacts of using the "wrong" water to provide optimal downstream fish habitat.

Conversely, removing the colder water from the lake would delay when the lake freezes (it typically freezes in mid-December but has frozen over as late as early January). It might also affect ice thickness. These could have local environmental impacts but are more likely to be relevant to winter recreational activities.

Much more concerning is the program's own finding that the preferred alternative will restore only about one-third of the watershed's potential fish habitat, and the amount of water released through the AWWU pipeline will represent only 4% of the river's historical summertime flow. A fast and simple multiplication of these two figures suggests that the preferred alternative only intends to restore about 1% of the watershed's historic fish-related functions and values. This clearly does not satisfy the requirements of the 1991 agreement.

Notably, none of the municipal, state, and federal agencies that participated in the field research and planning effort support the preferred alternative, except Alaska State Parks, which is certainly no expert on fish and wildlife habitat and productivity. The Native Village of Eklutna, the entity most affected by the loss of most of the river's salmon, does not support the preferred alternative. Instead they have proposed a "community alternative," one that wasn't considered in the draft plan.

I support the "community alternative," which will remove the dam in the near future, when the small amount of electricity that the hydroelectric facility's turbines produce is replaced by other alternative energy sources.

From: stephen Parker
To: Sam Owen
Subject: Eklutna River
Date: Saturday, January 20, 2024 5:03:17 PM

I am writing to support the removal of the Eklutna River dam.
The Eklutna River Hydro has a legal obligation to restore adequate river flows to support and reestablish wild salmon in the river and to the Eklutna Lake.
The restoration of the river must include connecting Cook Inlet to the Lake with adequate flows to allow for passage of wild salmon. Any alternative is inadequate, in violation of the agreement of sale of The Eklutna Hydroelectric Project and a waste of tax and ratepayers' money.

Thank you,

Write your comments on the Draft Fish and Wildlife Program here:

I am in support of either removing the dam entirely after replacement renewable energy has been secured or of replacing the dam with one that could be at a lower elevation and closer to the minimum amount of water left in the lake when drawn out by AWWU's the hydroproject. Either of these options would completely reconnect the entire watershed again, allowing salmon to travel through the watershed freely, as they should. I love that restoring 12 miles of fish habitat is important to the eklutna hydro stakeholders, but its really only 11 out of 30+ miles of fish habitat restored. I believe that salmon would utilize the watershed in its entirety. Thanks!

As a 73-year-old white woman who has lived a life of 'white' privilege, I wholeheartedly urge you to remove the Eklutna Lake Dam. By doing so, you will be helping to re-establish a slowly vanishing culture in a small native village. Haven't the native peoples of North America suffered enough at the hands of 'white' people over the past centuries?

Give them the respect they deserve and their culture back. Help them to re-establish the salmon run and therefore bring back the cultural side of people gathering to harvest nature. Listen to their desires and needs - they were here long before man moved in to try to 'civilize' them. Help them to keep their culture strong by removing the dam.

I am 2nd generation American, a descendant of Lebanese people who moved here at the turn of the 20th century. My biggest regret is that I was not immersed in my culture to the degree that I was able to pass more of it along to my children and grandchildren.

Cheap renewable energy for 25,000 Anchorage and Matanuska-Susitna Borough homes for decades? They will survive despite the increased cost. I'd hate to tell you what I pay GVEA for their power.

The natives were here long before the 'white' man. Give them their culture back.

Respect and support native pride!

Sincerely,
Candace Smith

Dear Operators of the Eklutna Hydroelectric Project,

As a tribal member of the Native Village of Eklutna, I can not stress how important fish are to our community and people. It is one of the most important traditional subsistence foods in our area. I grew up catching fish and setting fish nets in Eklutna. Those are my favorite memories. Learning how to cut fish, learning what the different parts are, how to set the net, how to bait the hook, how to tie fishing knots. All with my family. My siblings, parents, cousins, aunties, uncles, grandparents and great grandparents. When I have kids and grand kids, I want them to be able to fish those waters. Just how I did as a kid, and the rest of my family and elders. The fish are so important to our peoples health. Please remove the Eklutna dam. I stand strong with my family and ancestors. This means so much to our people. Restoring the fish back to their waters, that is their home!!

Chin'an.

Sincerely,
Isabelle Saam

The Eklutna hydroelectric project is a false solution to green energy. If a project destroys an entire river, including an integral part of the ecosystem - its salmon runs - it cannot be considered “green.” Of all of the potential alternatives offered by technical working group partners, the project owners chose the one that was the worst for the ECOSYSTEM BUT had the cheapest price tag. This violates the 1991 Purchase Agreement, which requires them to protect and enhance fish and wildlife habitat. The mitigation plan directed by said Purchase Agreement is in place so history doesn't repeat itself. The project owners need to come up with a new plan that respects the environment and the wishes of Native Village of Eklutna, who have been living on this land for generations and have been excluded from the decision-making process. Instead of wasting Alaskans dollars on a plan that won’t fully revive the river and its salmon runs, I ask you to remove the Eklutna Dam (at no cost to the project owners might I add) and fully reconnect the river to bring back a thriving Anchorage area fishery. Thank YOU.

To Whom It May Concern,

I am very concerned about the MEA and CEA plan and how little water it would leave in the Eklutna River. Their project has caused significant damage to the river system, and they should take more responsibility for restoring in-stream flow and ensuring salmon can return to Eklutna Lake. The current plan does none of those things. The only responsible course of action would be to honor the past and enduring connection the Indigenous people have to this place by removing the Eklutna Lake dam, fully reconnecting the river, and returning the water flows needed to support the river and its fisheries.

Thank you,

To those working on this project,

In Acknowledgment of Land Ancestors,

I was born to Denai'na Chickaloon territory; raised on Denai'na Kenaitze land at Eagle Rock on the Kenai River; and for more than forty years have made my home near Kachemak Bay and Homer, on traditional lands of Denai'na Athapbascan and Alutiiq Sugpiak people. I recognize responsibility to respect and care for this Indigenous land and inhabitants.

My parents moved to Alaska from Minnesota.
I am in full support of complete removal of the hydro electric dam. It is time to restore the Eklutna River to its full environmental habitat potential. This is the right thing to do. And it is overdue.

Sincerely grateful for this opportunity to offer comment.

There is no other reasonable option than to remove the Eklutna Dam entirely. There will be some temporary pain for electric utility ratepayers, but correcting a grave ecological error is worth the cost.

As with all obstacles to free-flowing rivers, here the river will eventually win. Instead of waiting centuries for natural forces to undo the damage of the dam, let's do it now so that our children can enjoy what Alaska Natives did 100 years ago.

I support restoring the entire Eklutna River, as the Native Village of Eklutna is entitled to from over 90 years of land taken from them and no direct benefit or fulfillment of an agreement between the entities in power and their Tribal government.

Other renewable energy sources are quickly entering the market for clean electricity. The time is now to advance the technology for the good, while correcting a past wrong.

I am reading a fascinating book How Infrastructure Works by Deb Chachra: 9780593086599 | PenguinRandomHouse.com: Books

How Infrastructure Works by Deb Chachra: 9780593086599 | PenguinRandomHo...

NAMED A BEST BOOK OF 2023 BY PUBLISHERS WEEKLY "Revelatory, superbly written, and pulsing with wisdom and human...

And the author suggests renewable energy sources work well in smaller, dispersed networks rather than a centralized mega station. There is also a safety benefit by having more redundancy in the system to mitigate major failures and weather disruptions from climate change.

I am glad this topic is coming to the public and that the Village of Eklutna is at the table this time. thank you

Subject:	The Eklutna River Draft Fish and Wildlife Program is inadequate!
Date:	Friday, January 26, 2024 4:13:35 PM

Dear Owners of The Eklutna Hydroelectric Project,

This comment is in regard to the Eklutna Hydroelectric Project's Draft Fish and Wildlife Program for the Eklutna River. The Native Village of Eklutna's vision for river restoration should be supported. Removal of the Eklutna Lake Dam is necessary to fully reconnect the river and return the water flows needed to support the river's fisheries. I urge you to consider removing this dam within the next decade, once replacement renewable energy is available.

The current proposal does not provide fish passage into the lake and upstream habitat. The river's historic salmon runs will never return under this plan. Approximately a mile of the river will remain dry and very little of the historic flow will be restored. You have a legal duty to mitigate the harm of this project. This proposal does not achieve that.

Please consider removing the Eklutna Dam so that all five species of salmon can once again return to the river.

Sincerely,
Christine Everett

Subject:	Comments on Eklutna Hydro: The only true restoration is dam removal
Date:	Friday, January 26, 2024 11:22:49 AM

Please consider these comments in the decision to fully restore the Eklutna River from its headwaters all the way to Cook Inlet.
The village of Eklutna is located on the banks of the Eklutna River for a reason. Based on my understanding, that reason was and still is SALMON.
One of the two dams has already been removed and the second dam will be removed free of charge to ratepayers.
None of the current analysis accounts for this best option. Also, none of the current analysis accounts for the potential benefits related to each option and none accounts for the future energy picture. If no further analysis is being conducted, the best option is to set a timeline for when our changing energy infrastructure will be able to allow the freeing of the Eklutna River and Lake ONCE AND FOR ALL ... FOR ALL 5 SALMON SPECIES. I support the entire removal of the Eklutna dam - removal that is free to ratepayers.

Hello,

I am in strong favor of dam removal, once other renewable energy sources are in place. The AWWU Portal option is insufficient; it would not allow sockeye salmon to spawn in Eklutna Lake, it will leave a mile of the river dry, and there are large amounts of habitat in the waters above the dam that will not be restored. After speaking with some of the experts you brought to the public comment meetings, they told me that they believe this is a good "first step" toward restoring adequate habitat and salmon populations. I am not interested in a "first step," as the time to act to restore Alaska's salmon counts and natural areas is now.

Hearing Chief Leggett of the Native Village of Eklutna (NVE) speak at the public meeting and express his displeasure in this plan should be enough to inform your decision. If you pride yourself on listening to the NVE, as you appear to by how many times it is mentioned in the Draft Fish and Wildlife Program and in your public meeting presentations, then please listen and act in accordance with NVE's wishes. This is a beautiful opportunity to engage in some small act of justice for the NVE, whose lands and waters were largely taken away and mismanaged through projects like the Eklutna Hydroelectric Dam. It is because of projects like the Dam that fish and wildlife populations are depleted, and it is through choosing to remove the dam and restore the river that healing can happen.

Please remove the dam and restore Eklutna River and Eklutna Lake. Please do so once other renewable energy sources are in place. Renewable energy, like the hydroelectric dam, is meant to help the environment. I believe in the Project Owners' ability to have renewable energy that does not come at the expense of salmon, wildlife, and Indigenous Peoples.

Thank you,
Emily Cohen, resident of Anchorage

Subject: Eklutna Lake dam
Date: Sunday, February 4, 2024 5:54:09 PM

I encourage the removal the dam on Eklutna Lake within 10 years, after other renewable energy sources are brought online to replace the hydroelectric power produced by the dam. The current Eklutna Hydroelectic Project provides 3-6% of electricity for the area. Wind, solar, and battery storage could replace this amount, and these renewables are declining in cost. Removing the dam will fulfill the 1991 agreement to let fish run from the ocean to the lake and its tributaries.

From:	Suzann Speckman
To:	Sam Owen
Subject:	Public comment
Date:	Monday, February 5, 2024 11:24:09 PM

To the Owners of the Eklutna Hydroelectric Project,

The 1991 Eklutna Fish and Wildlife Agreement required the Project Owners to develop and propose to the Governor a program to "protect, mitigate damages to, and enhance fish and wildlife impacted by the project." The alternative under consideration as the Draft Program does not meet the goals of the 1991 Agreement and is therefore inadequate. A different alternative must be considered that truly mitigates the damage done by years of diverted river flow, and truly enhances the fish and wildlife populations that were impacted.

I heard that someone called the proposed alternative a "Dead-End River," and that is regrettably true. The proposed alternative leaves one full mile of riverbed dry, with no water, which will prevent fish from reaching Eklutna Lake. As reported in the Anchorage Daily News on 04 February 2024, an engineering consultant, Don Spiegel of GV Jones & Associates, studied the portal valve that is key to the proposed alternative. These experts concluded that the portal valve would provide inadequate and irregular water flows to fish in the 11-mile section of the Eklutna River that is proposed to be re-watered. If salmon in those 11 miles of river would suffer periodic die-offs from inadequate and irregular water flow, as these experts determined, the proposed alternative becomes even less acceptable.

Why would we spend $57 million dollars for half of a project that fails to mitigate damages to Eklutna Lake, fails to mitigate damages to salmon in the river, and fails to accomplish the purpose of the 1991 Eklutna Fish and Wildlife Agreement?

The Eklutna Dena'ina people are clear in their desire to see the Eklutna River run wild again, along its full length, with healthy salmon runs in its tributaries and in the lake.

Allowing runs to rebuild for all five salmon species in the Eklutna River and Eklutna Lake would protect salmon populations and mitigate previous damages to salmon populations. It would also mitigate damages to other species that resulted when salmon runs in the Eklutna system were destroyed by installation of the hydroelectric system. Humans, especially the Eklutna Dena'ina people, would benefit from being able to fish in their traditional areas and ways. Bears and other fish-eaters would have more food, and browsers like moose would benefit when the nutrients from salmon carcasses spread into the surrounding riverside vegetation.

One of the most important species that would benefit from rebuilding salmon runs in the Eklutna system is the Cook Inlet beluga whale, which is listed as endangered under the Endangered Species Act. In the 2016 Cook Inlet Beluga Recovery Plan, NMFS listed anthropogenic disturbance and cumulative impacts as threats of high concern and prey availability as a threat of medium concern (NMFS 2016). Since publication of the Recovery Plan, evidence continues to accumulate that Cook Inlet beluga whales are suffering from limited prey resources, and this is contributing to the failure of the population to recover in numbers. Recent studies of Cook Inlet beluga whales conclude that reductions in prey availability, especially from late spring to early fall, adversely affect vital rates of Cook Inlet beluga whales (Norman et al. 2020, Warlick 2022, McHuron et al. 2023, Warlick et al. 2023). McHuron et al. (2023) also found that intermittent disturbances that resulted in lost foraging opportunities, such as those caused by anthropogenic activities during the ice-free season, had little impact on body condition or vital rates if prey were abundant during the summer and early fall.

In other words, availability of salmon and other prey influences beluga whale adult and calf survival, calving rates, age of first reproduction, interval between successive calves, and other life history characteristics. These in turn drive population trends. Beluga whales in good body condition, with

abundant prey, are better able to tolerate anthropogenic activities such as those that create noise.

Loss of the salmon runs in the Eklutna River and Eklutna Lake may be one of the many reasons the Cook Inlet beluga whale population is lagging in its recovery. Removing the dam and allowing full passage of the Eklutna River and Eklutna Lake to the five species of salmon would also increase prey availability to endangered Cook Inlet beluga whales. Removal of the dam is a remarkable opportunity to "enhance fish and wildlife impacted by the project," a stated goal of the 1991 Eklutna Fish and Wildlife Agreement, by enhancing the likelihood of survival of the endangered Cook Inlet beluga whale.

Removing the Eklutna dam to provide access for salmon to the full reaches of the Eklutna River and Eklutna Lake is an easy, concrete, quantifiable recovery action for both the five species of salmon and the endangered Cook Inlet beluga whale. We know that beluga whales use Knik Arm occasionally in early summer and daily in summer and fall from about August to October or November. Beluga whales forage in Eagle River and Ship Creek. They likely foraged in the Eklutna River when salmon were abundant there. Red salmon are a favored prey species for beluga whales, and their smaller size makes them more available to younger animals that cannot swallow a larger king salmon. Red salmon need access to Eklutna Lake to spawn and grow, and would become available to beluga whales in Knik Arm.

The Native Village of Eklutna is proposing a very reasonable compromise alternative that involves a delay in removal of the dam until more renewable energy sources have been developed. This alternative deserves closer examination because it more closely adheres to the goals of the 1991 Eklutna Fish and Wildlife Agreement to develop and propose a program to "protect, mitigate damages to, and enhance fish and wildlife impacted by the project." Community partners have committed to help offset costs of the dam removal, reducing the burden on public funds.

Please fulfill the intent of the 1991 Eklutna Fish and Wildlife Agreement and listen to the local people, scientists, and engineers who advocate for a healthy Eklutna River and Eklutna Lake system with access to the full 12 river miles and lake for salmon.

Finally, the Anchorage Daily News article on Sunday, 04 February 2024, described some confusing aspects of the proposed alternative that we simply do not yet understand. This includes a secret agreement between the utilities that will impact prices and the water rights of Anchorage. Not only should the alternative put forward support full passage for salmon, but I agree with the Assembly's proposal to delay the decision on the preferred alternative until the new information about contracting is analyzed and understood. The outcome of the process is too important to be rushed or hidden from the public's understanding.

Thank you for your consideration.

Sincerely,

Suzann G. Speckman

Dear Owners of The Eklutna Hydroelectric Project,

The Eklutna ecosystem is a gem waiting to return to its former glory.

With salmon runs in decline it is important to invest in the future of this historic salmon producing watershed.

This is an excellent opportunity to restore an ecosystem and invest in the salmon future of the Eklutna Dena'ina people who will be sustained by this resource.

The economic benefits of full restoration will outweigh the cost. The economy and wildlife will benefit from a restored fishery.

We need these fish. Alaska needs this resource. Removing the dam and full restoration makes plenty of sense. It is in everyone's best interest to take this opportunity and bring this system back. This can and should be completed.

Let us do what is right for the Eklutna people and for all Alaskans. Give the salmon a chance to come back.

Subject: Eklutna Dam removal comment
Date: Friday, February 9, 2024 5:19:55 AM

Hello,

The dam must be completely removed so that the river flows freely and naturally through its ancestral channel from the lake to the sea. Recreating the Eklutna River salmon cycle—with its ecological benefit to the watershed and Cook Inlet—should be our priority. Yes, this will reduce or even eliminate the flow to the Eklutna Power Plant. It may increase the cost of electricity. And there will be challenges for the municipal water supply system. But we (the community, CEA and other utilities, and the Muni) will muddle through and figure out alternatives that will work.

The carbon benefit of hydro should not blind us to that dam's historic destruction of Eklutna's wild salmon runs and the subsequent incremental degradation of the entire watershed. Removing that dam is a once-in-a-century opportunity for the community that will deliver priceless ecological, recreational and social justice benefits. We can find and develop alternative sources of power. There is no comparable alternative to a fully restored Eklutna River.

As a homeowner and rate payer, I'm willing to bear my share of increased power costs to help make this happen. I walk the talk too—we have 18 solar panels on the roof of our home.

Sincerely,

Doug O'Harra

Re: Eklutna Hydroelectric Project Draft Fish and Wildlife Program

The Ninilchik Traditional Council (NTC), governing body of the federally and state recognized Ninilchik Village Tribe, supports the Native Village of Eklutna (NVE) Eklutna River Restoration goals of their Resolution 2022 – 4; "Łiq'a nagh qinqtudeł - We are hopeful the salmon will return to us." "This includes 1) continuous flow in the river below the lake sufficient to support thriving salmon populations, with intermittent higher, habitat maintenance and re-creation flows, 2) salmon passage between Eklutna River and Lake, and 3) moderation of Eklutna Lake level variability, at levels sufficient to facilitate sockeye spawning."

No water is currently released downriver from Eklutna Lake, with 90% diverted for hydroelectricity generation. Fish passage is blocked to 8 miles of sockeye habitat in Eklutna Lake and 15 miles of Chinook and coho habitat in its tributaries at the Eklutna lake outlet dam. Kleinschmidt habitat assessments find abundant potential sockeye spawning habitat around Eklutna Lake, if provided restoration of fish passage at the lake dam and sufficient lake levels. Also, NVE habitat assessments found abundant Chinook and coho habitat in the Eklutna Lake tributaries, which only await restored fish passage to facilitate restored runs.

The electric utilities have put forward a Draft Fish and Wildlife mitigation Program "portal option" which would release minimal flows to the lower river from the Anchorage water supply pipe a mile below Eklutna Lake, leaving a dry river above that. It would be insufficient to restore historic multiple and side channels, and off channel habitat. Fish passage would remain blocked to sockeye habitat in Eklutna Lake and Chinook and coho habitat in the lake

tributaries. It ignores the advice and options submitted by NVE, resource agencies and other groups.

NTC joins NVE and allied organizations involved in the multi-year effort to restore the Eklutna River in advocating for removing or replacing the dam at the outlet of Eklutna Lake to allow adequate flows downriver and fish passage to upstream habitat. Dam removal is the cheapest option and NVE allies have offered to pay for it. Water could still be drawn for Anchorage's needs and some for power generation. This could be implemented within 10 years, once renewable energy alternatives are in place, allowing the river to flow more naturally. Thank you.

Sincerely,

NINILCHIK TRADITIONAL COUNCIL

Dear Owners of The Eklutna Hydroelectric Project,

I am incredibly disappointed with the project owners disregard for the land and the original inhabitants of the land. By choosing the cheapest solution they also choose to continue the unjust degradation of the Eklutna Village's most precious resource- salmon. As they continue to destroy salmon habitat, the owners greenwash their project in order to confuse taxpayers into thinking this is the most eco-conscious choice. Let's not fall victim to their immoral marketing and support a full restoration of the Eklutna river via damn removal or flows much higher than those proposed. Free the Eklutna River!

Sincerely,
Mandy Smith

To whom it may concern:

I am a homeowner and Chugach Electric member-owner in the Municipality of Anchorage. I am writing in my personal capacity today to support the Native Village of Eklutna's goal of restoring the river and full water flows to support salmon and other species - specifically through adoption of a plan that ends with complete dam removal.

The current proposed mitigation plan does not go far enough, fails to provide for fish passage into the lake and upstream habitat, does not have the support of the public, and would only release 3% of historic water flows.

Dam removal, in the alternative, would meet the recommendations of biologists from USFWS, NMFS, and NVE. It would begin to address a century of cultural and environmental neglect in this region, and be a step toward greater recognition of tribal sovereignty. While dam removal cannot happen overnight, it is possible and essential to adopt a plan that allows for onboarding of new renewable energy projects.

I urge you to strongly consider dam removal, and if necessary, to take additional time to do a full analysis of how to best meet the needs of NVE and the Owners of the project.

Sincerely,
Alex Petkanas

Subject: Comment on. The Draft Fish and Wildlife Program - Eklutna Lake
Date: Thursday, February 15, 2024 4:55:05 PM

I do not support the alternative proposed by the utilities that would not restore water flow to the full river and does not provide for fish access to the lake and upper tributaries.

The fish and wildlife plan should be a long term solution. By that I mean to look to plan for a 100, 500 year solution.

What is proposed accepts that the infrastructure established in the past, and the habitat harm that has resulted, is the new base to plan from. That is short sighted.

Imagine instead a river/lake system with natural salmon runs with all the benefits of such to wildlife and humans.

I do support the alternative proposed by Eklutna Native Community with, in part: full length river water flow, fish access to the lake and upper tributaries, ten years to allow for alternate power generation sources to come on line. I recognize this is an expensive alternative, however, it is the only alternative that remediates the impacts of the past in a meaningful way for the benefit of all Alaskans in the long term.

I am a 65 year Alaskan having lived in Kenai, Anchorage, Fairbanks, and Sitka. I have commercial, sport and subsistence fished for salmon. I am an active hunter for subsistence purposes.

Bart Meyer,
Sitka

To whom it may concern:

This comment is regarding the Eklutna Hydroelectric Project's Draft Fish and Wildlife Program for the Eklutna River. I'd like to start by expressing my disappointment in the format of the public meetings. The meeting I attended in Anchorage began with a presentation by a contractor employed by the utilities, without opportunity for other perspectives or rebuttals. The public was isolated for their submission of testimony rather than being able to hear from one another. I fear that the format was deliberately designed to obscure the growing consensus that the restoration plan presented is at best insufficient, and at worst, unjust.

Regarding the mitigation plan, I'd like to express my passionate support for the community alternative – namely, complete dam removal, once other sources of renewable energy have been secured.

For years now, my utility, Chugach Electric Association has been painstakingly slow to add renewable energy to the grid. Now, it is using the loss of a small amount of renewable power – approximately 3% of its total production – and subsequent rate hikes as its rationale for this inadequate plan. Pitting salmon against renewable energy is a false choice. And no amount of money saved or costs avoided can justify perpetuating the shameful legacy of colonization.

Unlike the "AWWU portal" plan, the community alternative would create a continuous flow of water from the lake to the ocean, for the restoration of all five species of salmon, as well as for the fish to return to tributaries above the lake. We have a generous commitment from nonprofit groups to remove the dam so that the rate payers and tax payers will not have to bear the cost of dam removal. Most importantly, we have a historic opportunity to restore salmon and to right a wrong that the Eklutna people have born for generations. I sincerely hope the the powers that be come to their senses, so that we won't squander the rare opportunity to wrong the rights of the past and restore salmon, beloved by all Alaskan, to this river.

Respectfully submitted,
Chantal de Alcuaz

Hello,

I am a ratepayer of Chugach Electric living in Anchorage and I am writing you to voice my support for the Community Alternative put forth by the Native Village of Eklutna.

As a ratepayer, I have no interest in paying for a 57 million dollar project that will not *meaningfully* restore the river. The current plan put forth in the Draft Fish and Wildlife Program, with the flow being restored below the AWWU portal valve, seems like an expensive bandaid that does not meet the asks of the Native Village of Eklutna to have this watershed fully restored, and so sounds like a waste of money to me.

I support their desire to have the Eklutna Dam completely removed at a later date, once replacement renewable energy is available to replace the hydro we get from Eklutna. The Eklutna river is a community asset not only to the Eklutna Tribe, but to Southcentral Alaska residents as a whole, and our utilities and municipality, have a responsibility to act as community stewards. Please work toward a *real* solution - I am fine with the necessary rate hike that will accompany a project of this size as long as it will lead to true restoration of this important watershed and the cultural implications it carries.

Thanks for you time,

Gabrielle Markel
Anchorage Resident

Subject:	Comments on the Eklutna Draft Fish and Wildlife Program
Date:	Saturday, February 17, 2024 5:49:22 PM

Thank you for the opportunity to comment on the Eklutna Draft Fish and Wildlife Program document. I appreciate the work you have done on the historical, contractual and alternative modification construction options to maintain hydro power for Chugach Electric/Matanuska Electric and protect the water supply for Anchorage. Your efforts are commendable; however there appears to be considerable differences of opinion on the best way to execute the 1991 Fish and Wildlife Program. It appears to me that most of the effort in the draft Plan is not for the fish and wildlife but for economics and ease of execution to modify in-place infrastructure. The simplest alternative, removal of the existing dam and restoration of the original river channel is missing. I find the **recommended solution presented in this draft to be based on unrealistic modeling[1] and it falls woefully short for the fish and wildlife.**

I am a double MEA ratepayer, so I appreciate the need to keep utility rates low. However, based on your report we are talking about at most only 6% of Chugach/MEA power generation. Other informed sources state[1] "The Eklutna Hydro Project produces 40-47 MW, which is 2.2% of the Railbelt's 2000 MW installed generation capacity. As a portion of CEA and MEA combined installed generation capacity, it's about 3.5% ". As a double MEA ratepayer, I would appreciate it if the economic portion of your draft proposal could clearly state what rate increase from ~$0.22/kWh I would incur **if NO power was currently available from Eklutna Hydro**. This should be a single sentence addition.

Recently electric rates have been in the news due to the fact that Cook Inlet (CI) gas is rapidly running out; 2 to 5 years has been stated in sources. Several solutions have been discussed: (North Slope NG pipeline-$50+ billion, 10 years minimum; major State subsidies for CI Producers, many $ billions; or imported LNG, higher costs). These all require State investment or subsidies with an accompanying electric rate increase estimated to be 50% to 100%. So what will Chugach and MEA do for the other 94 to 96.5% of their power generation? They will raise member electric rates 50 - 100%, I suspect. The increase to ratepayers for missing Eklutna hydro power will be relatively minor I believe. It would be simple for me to approximate the future impact on my power costs if you provide the information above regarding the current removal of Eklutna Hydro from the rate.

My preference for the Plan is to restore the five species of salmon to a pre-1914 Eklutna Lake watershed. That is not difficult according to UAF professor Dr. Peter Westley. He has recently stated "Salmon can recover quickly if given a chance." Removal of the dam would allow Chinook, coho and sockeye salmon (the most sought after species) to have a chance to repopulate the river, lake and tributaries, which is 65% of their available habitat. Over time, the watershed has the potential, with a resurgence of nutrients from spawned out fish, to also support native Dolly Varden and trout.

The Community Supported Alternative to remove the dam and restore the river channel has been offered funding by The Conservation Fund and Trout Unlimited at no cost to electric utility ratepayers. They have already removed a lower dam successfully in 2018 with this approach. The effort may be delayed for up to ten years to allow the utilities to replace the relatively small Eklutna Dam baseload generation (2-6% of current generation) with renewables, like wind and solar. Backup baseload reserve to support the renewables when the sun isn't shining and the wind isn't blowing could be easily provided on the rail belt by the planned 160,000 MWh Dixon Diversion to Bradley expansion or the 1.2 GWh utility-scale long-duration Pumped Thermal Energy Storage Project near Healy selected by US DOE in September 2023.

This latest Community Supported Alternative recommended by NVE could save the utilities and

ratepayers money and let Nature take us back to the watershed and salmon runs of the early 1900s. This option should not impact the AWWU water line serving Anchorage. The water intake is lower than the lake elevation managed for hydropower lows. There have been concerns regarding the water line within the river bed and downstream bridges under extreme flows, but those are both solvable engineering issues. This is a relatively simple solution compared to the complex scheme proposed in the current plan**. I strongly support the removal of Eklutna Dam and return of the early 1900s Eklutna River in the old drainage.** Evaluation of this alternative needs to be added to the Eklutna Draft Fish and Wildlife Program document. To present anything less, shortchanges the Fish and Wildlife aspect of the Plan and does not satisfy requirements of the 1991 Agreement.

More concerning, in my opinion, is Bretwood Higman's comment here about potential large-scale landslides above Eklutna Lake and accompanying lake tsunamis. These potential events will affect any option; during higher water levels with a dam breach results could be more catastrophic than a natural lake and downstream flowing river. Lower lake levels and the natural river drainage may offer a surge capability of sorts. Eklutna Village and surrounding areas need to learn more about this concern.

I am writing as a private individual, not in my former role with the Alaska Center. I am also writing as a lifelong resident of ANchorage Alaska, as an ecologist, as an Indigenous person, and as an advocate for renewable energy. Any Fish and wildLife program which does not explicitly attempt to restore populations for each species of salmon impacted by the hydroelectric project, including access to the entire stretch of habitat, from mouth to headwaters, is an unequivocal failure of the owners to live up to the requirements and expectations of the 1991 agreement, as well as their responsibility as public utilities to the Native Village of Eklutna, to the community of Anchorage, and to the integrity of their respective organizations. This reality has been embodied throughout the restoration process by the explicit manipulation of the study and review process, by the willful negligence of Mayor Bronson's management, by the misrepresentation of data, methods, and community perspectives by Macmillen Jacobs to the owners and the public, and by the secret contractual commitment with AWWU. In fact, every aspect I mentioned before, and countless others I have personally born witness to are nothing short of shameful. Every escalation of resistance to the owner's process is a direct consequence of their management of this project, and indeed the certain continued escalation and ensuing waste of taxpayer and ratepayer funds will also be a direct consequence and responsibility of the owners management as well. It is with clarity and urgency that I call upon the owners of the hydroelectric project follow through on their ultimate responsibility and select the community alternative, for the wellbeing of our community and future generations.

Subject: Eklutna Hydroelectric Preferred Alternative
Date: Saturday, February 17, 2024 12:37:06 PM

To the Operators of the Eklutna Hydroelectric Project:

I am resending my letter from yesterday that corrects a minor error.

This is a momentous opportunity to do something grand for natural resources conservation in the Anchorage area - restoration of what might have been the biggest salmon fishery in the entire Municipality. We owe it to the Native Village of Eklutna and to all the residents of the Municipality. Unfortunately, the preferred alternative of the Operators falls short. It is the least expensive option and has the smallest impact on current renewable power generation, but also produces the smallest gains in water flows and fish habitat. And because it relies on the AWWU portal it does not restore connectivity to the lake which means restoration of a modest sockeye salmon run will not occur. I could probably be talked into supporting an alternative that relies on the AWWU portal provided it was an interim solution that would eventually be eclipsed, in say 10 years, by a better alternative that restores full connectivity from the lake to the Inlet. An interim solution involving the portal would also provide additional time to bring other sources of renewable energy on line to replace that lost through reduced hydro generation especially in the winter. There are a number of other alternatives proposed by the Native Village of Eklutna, Trout Unlimited, The Conservation Fund, the U.S. Fish and Wildlife Service, and the National Marine Fisheries Service that do a far better job of improving fish habitat and restoring fish populations. Dam removal is also something that should be evaluated. The U.S. Fish and Wildlife Service said it well in their comments, "The Program should provide connectivity to the lake, release year-round flows to support salmon spawning and rearing habitats throughout the river corridor, and accommodate periodic high-volume flows for maintaining characteristics through a self-sustaining dynamic equilibrium between the hydrograph and natural sediment supply."

This is our opportunity to do something right, to right a wrong, and treat a neglected and abused river in a way that we can all be proud.

Sincerely,
Anthony R. DeGange

Subject: Comment on the Eklutna River Draft Fish and Wildlife Program
Date: Sunday, February 18, 2024 12:09:44 PM

To the Owners of The Eklutna Hydroelectric Project,

I am commenting on the Eklutna Hydroelectric Project's Draft Fish and Wildlife Program for the Eklutna River. The preferred restoration option of using existing AWWU infrastructure, leaving 1 mile of the river disconnected from the lake, and releasing only 3% of historic flows is insufficient and disappointing. The Native Village of Eklutna (NVE) has shared many times that their vision for the Eklutna River is to fully remove the dam. While this is the most expensive option for the owners and presents challenges, I believe that creative solutions can be found with the two year extension that the Anchorage Assembly has proposed. I urge the owners to support the dam removal option and work toward legal pathways to allow for two more years of study and planning to make this a reality.

As an earth scientist myself, I appreciate the years of study and work that have gone into developing the different restoration pathways in this process. I've also been following the updates and discussion at Chugach Electric Association board meetings for the last year. I believe the Eklutna Hydroelectric Project owners have been, in good faith, trying to find an acceptable restoration solution. However, the restoration of the Eklutna River and the Draft Plan, do not exist in isolation of other challenges on different timescales – from colonization and the destruction of the NVE's relationship to the river in the early 1900s, to the current gas crisis and need for renewable energy.

The importance of Eklutna to our renewable energy needs and the desire to keep energy costs low has been repeatedly stated by the owners, but how do we weigh this with the unprecedented opportunity to correct a historical injustice and center the needs of the Native Village of Eklutna? How do we assess the value of a thriving river with all five species of salmon to our communities against our energy costs? I know the owners have been grappling with these exact questions. The current timeline to provide a draft plan to the governor by April 2024 does not allow for an adequate resolution to these questions. Continuing to move forward with a plan that does not meet NVE's goals for the river is a missed opportunity.

The utilities have plans to adopt more renewable energy in the coming years (and doing so would lead to lower energy costs than continuing to rely 80% on gas). If larger renewable energy projects and associated storage for regulation are brought online, the argument of keeping the Eklutna dam and hydroelectric project for our renewable energy portfolio begins to dissipate. While I understand the 1991 Agreement may not necessarily legally require complete restoration and a return of the river to historic flows, it's about doing what's right and seeing this as an opportunity. The Native Village of Eklutna and conservation

organizations are ready to work toward creative solutions, to raise money to ease the financial burden to ratepayers, and to share a common goal with you, the project owners. The question is whether you choose to work toward what is right, despite the challenges, or hide behind legal language while knowing your current preferred option will result in dollars spent toward a solution that does not meet everyone's needs.

Thank you for the opportunity to comment.

Subject:	Comments on the Eklutna Draft Fish and Wildlife Program
Date:	Sunday, February 18, 2024 4:33:01 PM

Dear Ms. Owen and Chugach Board members,

I am writing to express my support for full restoration of the Eklutna River, consistent with the desires of the Native Village of Eklutna, multiple community organizations, and the majority of my neighbors and community members who have spoken up on the draft program to date. There are multiple reasons why the owners should pursue full restoration, i.e. removing the dam and restoring fish passage.

- As a rate payer and property tax payer, I am concerned about the cost of the AWWU portal option. We get essentially nothing for $57M. Dam removal would be cheaper and achieve full restoration of the river. As you are aware, two conservation groups have generously offered to pay for dam removal - and even graciously agreed to give you ten years to replace Eklutna hydro's energy generation, a mere 2-3% of Anchorage's energy. That's ten years on top of the 30 we've already been waiting for restoration of the river. The CEA letter shared with Anchorage Assembly members disingenuously compared this potential dam removal to the Klamath dam removal effort. Giving CEA staff and lawyers the benefit of the doubt, perhaps they are not aware that the Klamath effort entails removal of FOUR large dams on a much more complex river system spanning two states, with multiple invested parties and an adversarial history. My wife works for a Tribal organization engaging in this work. The Eklutna dam is not at all similar, and dam removal would be paid for a third party. This comparison was and is inaccurate.
- Dam removal honors Native values and historic and current uses of Dena'ina land and waters. The Native Village of Eklutna asked for evaluation of dam removal before the owners put forward their preferred alternative in the Draft; the owners didn't analyze it then, and still haven't. Refusal to do so is both disrespectful and financially reckless.
- Dam removal is better for fish and wildlife. I won't go into detail on why a natural, free flowing river is better for fish than a pipe, because that should be obvious.
- None of the parties except the utilities think the AWWU portal option is the best option. Please follow the advice of NVE, conservation groups, and the federal agencies engaged in this work.
- The 1991 Agreement envisioned that this process and the mitigation resulting from it should be as robust as would typically be required. The AWWU portal option and the process leading to it has not met this standard.

I have been interested in and watching this process for years, first as an elected official and now as a member of the community. As someone intimately familiar with public processes, I have honestly been shocked by yours. Having public meetings where the public can't speak? Not truly analyzing an option that a majority of folks, including the local Tribe, have requested? Signing a secret deal with AWWU before the public process theoretically begins? It is shameful.

I urge you to graciously admit your mistakes - it's not too late - and truly partner with NVE to move toward a program that restores the Eklutna river and the harms perpetuated for decades. If you need more time to do this, I suggest a delay to the program (which, by the way, despite

what CEA claimed in its letter, is not impossible - an agreement can be amended by the parties).

Thank you,

Austin Quinn-Davidson
Former Anchorage Acting Mayor, 2020-2021
Former Anchorage Assembly member, 2018-2023

February 18, 2024

To operators of the Eklutna Hydroelectric Project,

We were saddened to read what you proposed for returning water to revive the Eklutna River and its five species of salmon in draft Fish and Wildlife Plan. How can a non-contiguous flow of water from Eklutna Lake to the Inlet be considered an option? This plan does not meet your legal obligation to mitigate the project's impact to fish and wildlife. As we understand it, your proposal would still leave almost a mile between the lake and the "river" with no water flowing?? Also, the amount of water you suggest, (3 percent of the historic amount of water in the river) seems like a paltry amount for fish to survive. Steve and I don't see how anyone serious about really restoring this fishery could actually support this proposal. We feel that this is an attempt to deal with the problem without really coming up with a viable solution. Your recommended proposal will not restore the river's salmon runs and is unacceptable.

The Eklutna people and all Alaskans expect that this wrong be corrected. It is obvious to us that you need to remove the second Eklutna Dam to fully reconnect Eklutna Lake to the Inlet via Eklutna River. In addition, it is a no brainer for anyone who knows anything about salmon, that adequate, year-round flows of water from Eklutna Lake all the way to Cook Inlet are necessary for successful reintroduction of viable salmon runs. This should be the minimum requirement in your proposal for this wrong to be corrected.

We have lived in the Peter's Creek area since 1985, so we understand the need for the energy provided by the hydro power plant, but a viable proposal would address this issue and look at options for renewable energy that could replace this need. There have been huge improvements in our ability to harness energy in other ways including wind, geothermal, tidal options and certainly, in the summer, solar energy. Your proposal needs to look toward the future and suggest options that will actually bring the salmon back. As we understand it, there is a commitment from The Conservation Fund to orchestrate and fund removal of the second Eklutna Lake Dam. They already helped with the more expensive, bigger dam down river, so why not take advantage of this offer? It is at least a start toward moving to a permanent viable solution.

The Eklutna Hydroelectric Project deprives the Eklutna River of water and blocks salmon from migrating in and out of Eklutna Lake. Salmon populations will never recover without a reliable and consistent supply of water and access to important up-stream spawning and rearing areas. This is particularly true for sockeye salmon. If they can't access Eklutna Lake and its tributaries they cannot survive. All involved parties cannot meet their mitigation obligations without removing the second dam as a start to solving the problem, in my opinion.

The Native Village of Eklutna has been clearly wronged and a majority of Alaskans also feel that protecting and revitalizing all waterways that have, or once had, healthy salmon runs is very important. Locals and visitors alike are in favor of a proposal that will bring back the wild salmon species in healthy numbers to the Eklutna River, including Eklutna Lake and headwater tributaries.

Owners of the Hydoelectric Power Company and other involved parties need to make this right and not propose something that will cost a lot of money and still NOT FIX THE PROBLEM you are tasked with. Please invest in revitalizing the Eklutna River so that it is a viable habitat for the five species of salmon and right a wrong that has already taken too long to be resolved. This is something that you could take great pride in and show your support for the Native community that depended on the salmon, Alaskans, and our beautiful state's resources.

Sincerely,

Barbara A. Johnson Steve C. Johnson

Dear Operators of the Eklutna Hydroelectric Project,

Thank you for the opportunity of a public comment period on the draft Fish and Wildlife Plan proposed for the Eklutna River.

While I am not fully aware of our energy situation and all the details surrounding the future of our energy creation and consumption, I still strongly urge you to heed the recommendations of the Native Village of Eklutna to remove the dam and fully restore the Eklutna River. They feel strongly that removing the dam will restore the salmon to the river, and that the dam removal costs could be covered by two nonprofit organizations who have agreed to pay for it. I agree that at this point we should work to find other ways to create/harness energy, and make the choice that returns the river to it's natural state before the dams were built.

Damming rivers has rarely been the right choice for local people. There are many examples of this from around the world, throughout history. By restoring the wild salmon run, you would be righting a historic wrong on the Eklutna River.

Sincerely,
Candice Kotyk

Date: Sunday, February 18, 2024 11:26:44 AM

To the operators of the Eklutna Hydroelectric Project,
I am writing regarding the Eklutna River and your draft Fish and Wildlife Plan. As I read it, your proposed plan does not meet your obligations to the Eklutna Peoples, including the restoration of an accessible salmon run. It is an inadequate plan that leaves a mile of the river dry and releases only a small fraction of the past flow of the river. It is an inadequate plan that does not provide fish passage into the lake and upstream habitat.
The best plan would be to remove the Eklutna Dam and fully return the water flows that support the salmon and other river fisheries. The Native Village of Eklutna wants the river restored. Many Alaskans and those watching this unfold from outside Alaska support the removal of the dam and the restoration of the river. The salmon need a consistent supply of water and access to spawning areas in order to recover.
I see you are proposing the removal of the dam a decade from now, but that may be too late. I support removing it sooner.
Thank you for your consideration.

Subject: Public Comments on Power Companies Draft Eklutna River Fish and Wildlife Plan
Date: Sunday, February 18, 2024 5:33:33 PM

Thank you for the opportunity to comment on the draft Fish and Wildlife Plan proposed for the Eklutna River.

I request the power companies (MEA, CEA and MOA) adopt the community alternative for restoring the Eklutna River based on the following factors:

Restoration of culturally and biologically significant salmon runs:
Adopt the "community alternative" of dam removal to bring back a once-thriving salmon river to its historic capacity, thus providing restoration of culturally significant salmon resources to the Eklutna Tribe and access to large multi-species salmon runs to residents of Southcentral Alaska. Only restoration of significant in-stream flow from mouth to headwaters will fulfill the requirements of the 1991 agreement. Anything that does not do so leaves the power companies liable for not meeting the agreement requirements and open to legal action for not doing so.

Zero effects on the electricity in South Central Alaska:
Eklutna hydroelectric currently is a source of only 2.2% of the Railbelt's energy capacity. The community alternative, which calls for the removal of the dam, would take place within the next decade, and only when replacement renewable energy is expected to be available. It is shameful that the power companies never evaluated dam removal despite being requested to multiple times and then used their own hand picked consultant to deliver one-sided information to support the abrogation of their duty under the 1991 agreement. It is significant that the hydro project remains still operational even with the dam removed!

Zero effects on drinking water:
The water intake is located low in the lake and if the dam were to be removed, the lake would return to natural levels and leave the water intake (as well as the hydro intake) unaffected.

Power companies' proposal puts increased costs on the backs of ratepayers and abrogates their fiduciary responsibilities:
The proposal in the draft plan from the hydroelectric project owners would cost ratepayers and taxpayers an estimated $57 million, while the community alternative replaces the Eklutna hydro capacity and removes the dam at no cost. This power company plan predicts rate increases of .65% for CEA ratepayers, .87% MEA ratepayers, and $0.54 annually for Anchorage taxpayers. And, this does not include any consideration of legal costs once a poor decision heads to court.

Summary:
The deeply flawed power company proposal generated by a one-sided, poorly run technical review process along with the refusal to incorporate community input during the "working group" process also leaves a mile of the river dry, which prevents salmon returning to the lake

and upper tributaries. In contrast, the removal of the dam (community alternative) would be paid for by two non-profit organizations that have agreed to cover the costs. Why are the power companies ignoring a cheaper and more community-oriented proposal and instead pushing blindly ahead with an ill-considered option that puts additional costs on the backs of rate payers? This is truly headed to court and throwing away ratepayers money beyond even the $57M initial cost. Furthermore, it is unconscionable that the power companies are choosing to not honor the Municipal Assembly request to wait two years for making this significant decision, especially when the Assembly's interests have not been included or even represented during this terribly flawed review process.

Closing:
I strongly urge you to heed the recommendations of the Native Village of Eklutna to remove the dam and fully restore the Eklutna River. Not only would removing the dam restore salmon to the river, it will avoid financially burdening utility ratepayers and MOA taxpayers with a short-term, insufficient plan. Instead, the dam removal costs could be covered by two nonprofit organizations who have agreed to pay for it.

You have the opportunity to be leaders - learning from historic mistakes of damming rivers, by restoring a wild salmon run, and in righting a historic wrong on the Eklutna River all while making the appropriate fiduciary decision for rate payers.

Sincerely, Joe Banta

Eklutna Dam Issue	Community Proposal	Power Company Proposal
COST	Zero cost to ratepayers	$57M on backs of ratepayers and headed to litigation
DAM REMOVAL	Yes	No
DRINKING WATER	No effect	No effect
SALMON RUN RESTORATION	Yes	No
CULTERALLY RESPONSIVE	Yes	No
PROPOSAL DEVELOPMENT	Consensus based	One sided and technically flawed

To whom it may concern:

Since the Eklutna Hydroelectric Project became operational in 1955, it has caused the Eklutna River to run dry. The amount of power being produced by the hydro-dam is not sufficient to warrant leaving the Eklutna River disconnected from Eklutna Lake. The salmon migration has been blocked for long enough. The Native Village of Eklutna's alternative plan to remove the dam would allow for the recovery of Chinook, sockeye, and coho salmon, by re-connecting the river to the lake.

Tsin'aen (thank you),

Andrea James

Subject:	Comment on the Eklutna River Draft Fish and Wildlife Program
Date:	Monday, February 19, 2024 2:58:27 PM

Dear Owners of The Eklutna Hydroelectric Project,

It's time to remove the Eklutna Dam and work to restore precious salmon runs all the way up the Eklutna River, including into the lake! This will mitigate the 73-year impact of the dam and fulfill the 1993 Mitigation Agreement that was signed by all involved parties. Dam removal will restore salmon that have been important to the subsistence and culture of the Eklutna people who live in the area.

I recognize that the power from the dam - only a fraction of what Anchorage uses each year - may seem more important as a clean energy option as our gas supplies are drying up over the next several years. But a smart alternative has been proposed that will protect the energy provided by the dam while it is most needed, and will also allow the restoration of this important subsistence, cultural, and ecological resource.

That option is the one that has been carefully studied and is supported by not only the federal agencies with responsibility for the fish and associated natural resources of the Eklutna area (U.S. Fish & Wildlife Service, National Marine Fisheries Service), but also the Eklutna tribe that has subsisted here for generations, and conservation groups such as the The Conservation Fund and Trout Unlimited.

I urge you to accept and implement this option, which is to remove the dam in 10 years. This will provide enough time for planned renewable energy projects to come online. Moreover, two groups have come forward to generously cover the full cost of dam removal, so that Anchorage ratepayers will not be burdened. We owe a tremendous debt of gratitude to the Conservation Fund and Trout Unlimited for providing these funds This will save ratepayers money and restore an environmental gem to Anchorage. Most importantly, it’s the right thing to do.

By the way, I am not new to this discussion, or the science behind the proposal. I was the Field Supervisor for the Anchorage Fish and Wildlife Field Office in the 1990s and 2000s when the mitigation plan for the Eklutna River was first being developed. Back then we worked with all the involved groups, including the Conservation Fund, the Eklutna Tribe, and the Municipality to determine how to best restore the salmon and the river so that all would benefit. It's time to put this best option of dam removal in place!

Sincerely,
Ann Rappoport

Subject: Eklutna Public Comment
Date: Monday, February 19, 2024 6:17:24 PM

Note: For public record I am submitting the following letter on behalf of Native Movement. It was signed by 118 individuals across Alaska and the country in support of the Community Alternative put forth by the Native Village of Eklutna. The spreadsheet with their names and contact information is also shared below. Thank you ~ (this e-mail was also submitted via brandon@nativemovement.org but our domain is down today)

To Whom It May Concern,

Thank you for the opportunity to comment on the Eklutna Hydroelectric Project. Native Movement is a statewide non-profit organization dedicated to building people power, rooted in an Indigenized worldview, toward healthy, sustainable, and just communities for all.

The Eklutna Dena'ina peoples have relied on and carefully stewarded the Eklutna River's rich salmon runs since time immemorial. The proposed Eklutna Hydro Plan is inadequate to protect salmon and the Eklutna Dena'ina peoples. We therefore support the Community Alternative put forth by the Native Village of Eklutna. This alternative respects the Native Village of Eklutna's stewardship and addresses decades of cultural and environmental neglect. It would restore the natural flow of the Eklutna River and its salmon habitat, allowing the salmon to return to their spawning grounds. It would also save ratepayers money and allow for the transition to new renewable energy projects. To learn more, check out these FAQs compiled by the Eklutna River Restoration Coalition.

Additionally, Native Movement supports the Anchorage Assembly's resolution AR 2024-40 that passed unanimously and seeks a two-year extension of the 1991 agreement. This extension would provide an opportunity for more meaningful consultation between the Native Village of Eklutna and the project owners (Chugach Electric Association, Matanuska Electric Association, and the Municipality of Anchorage).

We stand with the Native Village of Eklutna in demanding a long-term solution that restores the Eklutna River to its natural condition.

Signed,

Re: Comments in Support of Eklutna Salmon and a Free-Flowing Eklutna River

To Whom it May Concern,

Chickaloon Native Village (CNV) is a federally recognized Ahtna Dene Tribe in southcentral Alaska, governed by Chickaloon Village Traditional Council (CVTC). CNV's ancestral territory and traditional area of influence include trading trails that span from the Beaufort Sea to the Copper River Delta. This territory also encompasses much of southcentral Alaska, Upper Cook Inlet, the Copper River Region, the Alaska Range, the Matanuska River watershed, and the Susitna River watershed. We acknowledge that this region overlaps neighboring Dene and other Tribal traditional customary use areas, including those of the Native Village of Eklutna. Actions that occur within Dene traditional ancestral territory and customary area of use (as noted above) may impact the environment, Dene cultural resources, and the health of Tribal citizens and community members.

CVTC fully supports the Native Village of Eklutna's vision for Eklutna Watershed:

- The Eklutna River running freely, continuously, and naturally from its glacial headwaters through its dramatic canyon and its productive estuary to the marine waters of Cook Inlet.
- All five species of Pacific salmon (King, sockeye, silver, pink & chum) again swimming freely from Knik Arm through the entire length of the Eklutna River to their spawning grounds at Eklutna Lake.
- An abundant salmon fishery that supports the Eklutna Dena'ina and the people of Southcentral Alaska.
- Eklutna Lake, centerpiece of Chugach State Park, full to its natural lake level to support sockeye salmon shore spawning and human-powered recreation.
- An Eklutna River that rebalances the needs of fish, the Eklutna Dena'ina, drinking water for Anchorage, and low-carbon power production.

CVTC fully supports the comments and position of the Native Village of Eklutna (NVE) as presented in their December 4, 2023 comments on the Chugach Electric Association, Matanuska Electric Association, and Municipality of Anchorage ("Project Owners")'s Eklutna Hydroelectric Project Draft Fish and Wildlife Program ("Draft Program"). NVE's

letter clearly presents the biased inadequacies of the Draft Program and CVTC agrees fully with NVE. The Draft Program fails to meet the fundamental purpose of the 1991 Eklutna Fish and Wildlife Agreement.

From page 4 of NVE's December 4, 2023 comments:
NVE's alternative of dam removal within ten years will provide fish passage upstream and downstream to and from the lake and upper tributaries and return the river's natural flow regime that salmon co-evolved to depend upon, restoring the entire river and lake ecosystem. This proposal aligns closely with National Marine Fisheries Service ("NMFS"), US Fish and Wildlife Service ("USFWS"), and other Technical Working Group ("TWG") member's study period preferred alternatives with fish passage to and from the lake and flows that closely mimic the river's historic natural flow regime. The Conservation Fund has pledged to pay all the costs of removing the Eklutna Lake dam.

From page 12 of NVE's December 4, 2023 comments:
The preferred alternative [of the Project Owners] continues to create a dead-end river, with over a mile of dry streambed below the dam. Creating a dead-end river hardly mitigates the damages caused to fish and wildlife from the Project because it prevents connectivity between Knik Arm, the lower Eklutna River, the lake, and the upper tributaries. The preferred alternative cannot mitigate damages to sockeye in any way because it will continue to prevent nearly all anadromous sockeye from spawning in the Eklutna River system. Because the destruction of the sockeye run was the "specific concern" leading to the Agreement, a Program that continues to prevent almost all sockeye from spawning is impermissible. The preferred alternative permits less than 10% of the river to flow down its historic channel to the Knik Arm, the smallest amount of any proposed alternative.

CVTC staff have taken the time to review the Eklutna Fish and Wildlife Program draft, the Cultural Resources Report, and Native Village of Eklutna's (NVE) comments dated December 4, 2023. CVTC fully supports NVE's response to the Draft Program including NVE's Traditional Ecological Knowledge (TEK) that has been ignored throughout the report. CVTC will remind the "Project Owners" that the Indigenous peoples of Alaska are the Original People of the land and understand its ecosystems far longer than Euro-Americans and colonists that have moved in over the last 150 years into the immediate area.

The following concerns regarding the Cultural Resources Report as follows:

- 2.1 Indigenous Occupation: "The United States purchased Alaska from the Russian Empire in 1867." This is technically not correct, by the Doctrine of Discovery and international laws on conquering nations, Russia technically only owned two forts on two different islands within Alaska, they never completely conquered Alaska or all its Indigenous Peoples.
- 5.1 Eklutna Lake Shoreline Survey – report mentions shovel tests were excavated along the lake shore but did not specify the screen mesh size. Was it 1/8" or ¼"?
- Earliest cultural resources investigations noted in the report are 1983 to 1984, 40 years ago while the Eklutna river and lake had been disturbed with construction in the 1920s with no mention of archaeological survey. The report mentions considerable disturbance and bulldozing throughout construction, land clearing, and redirection of flow. It is likely considerable cultural resources were lost during this time and SOI-Q Archaeological and Tribal monitors should be present for all ground disturbance.

Lastly, the Draft Program assumes that all costs associated with dam modifications and restoration will be borne by the rate payers. This is unnecessary and highly unlikely, especially if there is extensive restoration for fish and wildlife habitats. The Conservation Fund has already (and repeatedly) agreed to fund removal of the Eklutna Lake dam and there are numerous federal grant funding sources available for fish habitat restoration activities. This funding information should be shared publicly and with the governor for more accurate understanding of the costs of the alternatives. CVTC appreciates the opportunity to comment on this biologically and culturally very important project and urges all decision-makers to restore fish passage to Eklutna Lake and the entire Eklutna Watershed.

From: Christine Wilcox
To: Sam Owen
Subject: Eklutna dam
Date: Monday, February 19, 2024 1:32:20 PM

I am deeply concerned about Eklutna dam project. I support the removal of the dam in 10 years to allow for renewable sources to come online to replace the dam. For the health of the community and the waterway, this is the healthier and cost effective solution.

RE: Public comment on the draft Fish and Wildlife Plan

To the Eklutna Hydro Program Development Team:

Cook Inletkeeper is a community-based nonprofit organization formed by concerned Alaskans in 1995 to protect the Cook Inlet watershed and the life it sustains. Please accept these comments on the Eklutna draft Fish and Wildlife Plan on behalf of our organization and its more than 6,000 members and supporters throughout southcentral Alaska. Our concerns in this matter center on people and environmental justice, wild salmon and their habitat, and the critically endangered Cook Inlet beluga whale and its potential for recovery.

We support the people of the Native Village of Eklutna and their desire for wild salmon to thrive once again in the Eklutna River watershed providing for cultural practices and food sovereignty.

The 1991 Purchase Agreement allowed the Eklutna Project Owners to side-step the federal licensing process by FERC, thus official government-to-government consultation with Federally Recognized Tribes was not conducted thirty years ago, or likely any time before that. This injustice must be rectified. The people, who stewarded these lands and waters for thousands of years, must be respected as the priority stakeholders and their wishes and knowledge considered above all others in the selection of a final alternative.

We support removal of the Eklutna Lake Dam because it is the only alternative to meet the purpose of the Purchase Agreement.

The Purchase Agreement requires that the utilities work with key federal agencies to develop a Fish and Wildlife Plan with the purpose of developing and implementing measures to "protect, mitigate damages to, and enhance fish and wildlife (including related spawning grounds and habitat)." We agree with comments submitted by one of the key federal agencies - the U.S. Fish and Wildlife Service - which states that the draft plan does not meet the intent of the purchase

agreement because it does not address fish passage:

> "The Program should provide connectivity to the lake, release year-round instream flows sufficient to support salmon spawning and rearing habitats throughout the river corridor, and accommodate periodic high-volume flows that maintain habitat characteristics through a self-sustaining dynamic equilibrium between the hydrograph and natural sediment supply." (p. 3, U.S. Fish and Wildlife Service comments)

The inadequacy of the "Selected Alternative – Portal Release Facility" to achieve the intent of the Purchase Agreement should make it a nonresponsive option for the Fish and Wildlife Plan.

In addition to widely-shared concerns about the Selected Alternative providing inadequate stream flows to support downstream habitat, Inletkeeper rejects that three (3) years of winter temperature monitoring is adequate to assess thermal suitability of salmon habitat. With our rapidly changing climate and documented warming freshwater conditions in Cook Inlet salmon streams (Mauger et al. 2017), year-round monitoring is needed for a bare minimum of five (5) years.

We support removal of the Eklutna Lake Dam to create more foraging opportunities for beluga whales in their critical habitat in upper Cook Inlet.

The majority of the Cook Inlet beluga whale population forages at the mouth of the Eklutna River during the summer. Despite the obvious omission of the impact restored Eklutna salmon runs would have on potential recovery of this critically-endangered species, Inletkeeper requests that this analysis be completed and considered before a final alternative is selected.

We'd like to highlight comments submitted by one of the key federal agencies – NOAA and its National Marine Fisheries Services – regarding the link between beluga recovery and an increase in Eklutna salmon:

> Listed as endangered in 2008, the Cook Inlet beluga has experienced continued population decline and range retraction, with the entire population now occurring primarily in the upper and middle Inlet. Pacific salmon are a key prey item for Cook Inlet belugas, and the geographic distribution of the whales is strongly influenced by seasonal fish runs. Knik Arm, into which the Eklutna River flows, is important Cook Inlet beluga whale foraging habitat. In addition, Knik Arm, including the mouth of the Eklutna River, is designated critical habitat for the population. … Improving fish passage and habitat connectivity, as we recommend here, is anticipated to have beneficial effects to both the Cook Inlet beluga whale and its critical habitat and will support recovery of the population. (p. 6, NMFS comments)

Conclusion

Inletkeeper wholeheartedly supports renewable energy solutions to our climate and local energy crisis. By removing the Eklutna Lake Dam, the Railbelt will lose 3-4% of its generation capacity; however, this loss can be easily made up by renewable energy project coming online in the near future. We believe the Community Supported Alternative is the solution that is a win for people, a win for salmon, and a win for belugas. We support removing the Eklutna Lake Dam in the next 10 years with great investment by the conservation community and restoring the Eklutna River and its wild salmon populations to benefit the Native Village of Eklutna and all the Alaskans who recreate and enjoy the area.

Re: Public Comment on Eklutna River Fish & Wildlife Program

Dear Eklutna Hydro Project Owners,

The Eklutna, Inc. Board of Directors respectfully submits these comments in response to the draft Eklutna River Fish and Wildlife Program (Program) released October 27, 2023.

I. Introduction

Eklutna, Inc. is an Alaska Native village corporation managing the land and interests of Eklutna shareholders. It is well-known Eklutna, Inc. is the largest private landowner in Anchorage, but Eklutna should also be recognized as one of Anchorage's largest philanthropic organizations. Eklutna, Inc. has endlessly contributed its most precious resources to the development of Anchorage – willingly or not.. At first, the flow of the Eklutna River was dammed in 1928, severing the water and salmon from our people. Then, in 1936, a federally-withdrawn reservation of 328,000 acres was withdrawn for the benefit of Eklutna but was eventually reduced by the US Government to a mere 1,900 acres by the 1950s. Part of these remaining lands housed the Eklutna Vocational School, where Eklutna and other tribes' children were made to assimilate to western culture and forced to cede our cultures. Shortly after the school was closed, the US Army began creating one of Alaska's most heavily contaminated sites at Camp Mohawk inside the Eklutna Village. Around the time the US Army left Eklutna, the Alaska Railroad started mining the granite knobs from which the name 'Eklutna' was derived. These acts perpetrated upon Eklutna are difficult to comprehend now.

Our lands provide many painful reminders of what our people have given to Anchorage's development. However, Eklutna, Inc. has continued to contribute to the growth of Anchorage. Utility lines and roads etched through our land. More than a thousand units of housing built on our lands. Land provided for school sites, airports, municipal purposes, parks, and public safety. Eklutna has long been deeply invested in the prosperity of Anchorage and Alaska as a whole. And now, as one of the state's largest land developers, we recognize the critical intersection between environmental stewardship and economic development. The restoration of the Eklutna River is more than a conservation effort; it is a strategic investment that will protect salmon habitat, boost tourism, elevate recreational activities, and increase property values.

Eklutna, Inc. and its partners took the first step in restoring the Eklutna River by taking down the lower river dam. Now, we urge the Project Owners (Chugach Electric Association, Matanuska Electric Association, and the Municipality), but also the entire Anchorage community, to collaborate in enhancing the draft Program to restore the remainder of the Eklutna River. By doing so, we will shape Anchorage into a city that offers a high quality of life, with the Eklutna River serving as a natural, cultural, and economic centerpiece of the city. Simply put, the AWWU Portal option[1] forwarded by the Project Owners does not achieve those goals for the Eklutna River.

II. NALA, ANSCA, and the Eklutna River

We urge a more thorough examination of the economic impact on landowners, such as our corporation, due to the devaluation of landholdings. Eklutna, Inc. owns nearly all the land on either side of the Eklutna River and around Eklutna Lake. Additionally, the State of Alaska's Public Access Assertion and Defense unit has deemed Eklutna, Inc. as the owner of the riverbed of the Eklutna River. By this assertion, the Eklutna Dam is sitting upon Eklutna, Inc. land. We would then pose the question of whether the Eklutna Dam, on Eklutna, Inc. property, is in trespass. There should be consideration of the legal ramifications of Eklutna, Inc.'s ownership of the riverbed. There is also a need for the Program to account for riparian zone rights with the consideration of the effective regulatory taking of the Eklutna, Inc. land, suppression of economic opportunities on these lands, and the continued destruction of public and subsistence resources. These are "other considerations under State law" that are important to the analysis.

On a related topic, the North Anchorage Land Agreement (NALA), as interpreted by the State of Alaska, prohibits development of Eklutna lands within the Chugach State Park. This prohibition has been in place for over 40 years. NALA is rooted in the conflicts between the Municipality, State of Alaska, and Alaska Railroad as Alaska Native Claims Settlement Act (ANCSA) selections were made. ANCSA lands were selected based on cultural and subsistence values and areas of potential economic value - a vehicle for economic development leading to opportunities and benefits for the shareholders of Eklutna. NALA freezes nearly 40,000 acres of Eklutna, Inc. lands within Chugach State Park from any economic or occupational benefits due to park management restrictions. The combination of NALA lands, lands bordering the Eklutna River, and a dry river bed results in the decimation of economic value for over half of the Eklutna, Inc.'s ANCSA land conveyances with severely diminished subsistence and cultural value. These agreements, where promises to the Eklutna people are broken or where we were not even considered a party, continue to stunt economic growth for Eklutna, Inc. and Municipality. Meanwhile, various public and quasi-public entities have generated hundreds of millions of dollars in revenue from the resources on the lands for the last 30 years.

III. Preserving Indigenous History and Rights

[1] The AWWU Portal is also referred to as the Eklutna River Release Facility option in the Program. This option proposes to draw water from Eklutna Lake to spill 27 to 40 cubic feet per second at river mile 11 through an AWWU facility. This leaves one mile of the Eklutna River dry from the release facility to the Eklutna Dam, thus not connecting Eklutna Lake to the river system.

The historical presence of Eklutna around the Eklutna Lake and subsistence issues must be acknowledged and integrated into the decision-making process. In most documents evaluating project alternatives, the original condition of the environment is considered. We suggest including a detailed accounting of the Eklutna River before the 1928 hydroelectric power project, rooted in tribal ecological knowledge from the records of the Native Village of Eklutna and other available sources. The public deserves to understand better what may be gained through connecting the Eklutna Lake to the Cook Inlet. Currently, the Program advances selective studies dispelling the existence and viability of sockeye in the Eklutna Lake. A fair and balanced document would include the narrative of pre-1928 Eklutna River conditions.

Protection of Native hunting, fishing, and gathering rights is a part of Alaska law and federal law. There was no discussion of subsistence rights and resources in the study. This analysis would be included in a Federal Energy Regulatory Commission re-licensing process. We believe the public would expect a detailed description of subsistence resources along the Eklutna River. Rather than discuss Eklutna River public and subsistence resources, the Program inexplicably assesses the recreational impacts on an artificial fishery – Eklutna Tailrace. Please explain the obligation to mitigate an artificial fishery likely created to substitute for the destruction of the prominent Eklutna River salmon runs less than 10 miles away. We do not understand why that impact is worth considering while the value of subsistence fishing and legal obligations to protect these rights is essentially ignored. Another requirement under State law mostly ignored in the Program.

IV. Energy Considerations

Eklutna, Inc. is situated within the service areas of Matanuska Electric Association (MEA) and Chugach Electric Association (Chugach). Eklutna, Inc. is currently exploring alternative energy projects with both utilities that would augment energy generation from alternative/renewable energy sources. We believe it is worth exploring an option where the Eklutna Dam is removed once adequate renewable energy sources are commissioned to replace the production from the Eklutna Project. With the expansion of the Bradley Lake hydro project in the next decade, it appears adequate replacement renewables are available in the next few years.

The stated need for the continuing existence of the Eklutna Hydro Project is the economic value of damming the River. The Program states the Eklutna Project is the lowest-cost energy source in the MEA and Chugach systems. The Program indicates the electricity is generated at $85/MWh. Recently, it was reported that the Houston Solar project power was purchased by MEA at $65/MWh. New power purchase agreements are typically based on the avoided cost of the utilities' portfolio, which is the cost the utilities would have to pay to produce the same power. Chugach Electric's avoided cost is reportedly even lower. A major cost, forwarded by the Project Owners, for dam removal or dam replacement is replacement energy costs – upwards of $150 million in the next 35 years. The Program predicts replacement electricity rates to reach over $130/MWh in 24 months and likely escalate sharply from there. We understand solar is an intermittent energy generation source, and a firm power source such as natural gas or hydroelectric is preferred, but we question how the replacement energy is determined based on these numbers as well as the CAPEX costs we will address later in this letter.

We would also note the Eklutna Generation Station (EGS) is rarely operating at full capacity, which would employ all of its 10 gas-powered turbines. It is important to consider the necessity of a 40-MW of hydroelectric generation when the EGS is only fully-employed for a handful of days per year. The EGS provides the same firm power supply as the hydro project for timely dispatch and offsetting renewable energy variability. We understand natural gas supply is reportedly waning, but shortfalls in gas supply cannot be offset by Eklutna Hydro. Thus, what is the "utility" of this hydropower resource when there is gas plant eight times its size nearby, providing firm power, needed for a handful of days per year, which dwarfs power to be dispatched from Eklutna Power Plant. When utilities are actively lobbying against Renewable Portfolio Standards, is it really the clean, firm power that is desired or maintaining the low-cost status quo at the expense of another resources?

The Eklutna people had their lands and resources diverted to Anchorage public water usage and electricity generation for the Eklutna Generation Station (ESG) and the Eklutna Dam. We understand the competition between Eklutna, Inc.'s needs and those of the utilities bringing power and water to our community. However, the Eklutna, Inc. board of directors demands a better approach to balance these needs, namely a means of fish passage to Eklutna Lake and more in-stream to the Eklutna River.

V. Corporate and Government Accountability

The Program outlines the remaining process for public review and the Governor's decision on the final Program. The utility-driven public process is closing, but the Governor's Public Interest Determination (Determination) process is not well defined. The Program alludes to the Alaska Energy Authority leading the State evaluation process; however, that agency would be an unlikely candidate for executing a public process and delivering a fair decision on the Governor's behalf. We request greater clarity on which department or division within the State of Alaska will be responsible for the State's public process leading to the Governor's Determination decision. Additionally, we request a meeting with the Governor and the state officials directing the public process to express our further position.

VI. Economic Analysis and Utility Revenue

We appreciate the Program recognizing Eklutna, Inc.'s contributions to the CAPEX for the dam replacement options. During the public meetings in January, McMillen consultants were unable to articulate how CAPEX figures for dam replacement ranged from $118-170 million when Eklutna, Inc. determined the cost of dam replacement would be closer to $57 million or lower.[2] The inflated CAPEX has been a driver for the Project Owners to promote the AWWU Portal option, disillusion rate payers, and deny options to meaningfully mitigate damages and enhance fish and wildlife habitat.

The Project Owners have had since 1997 to plan for enhancement and mitigation of the Eklutna Dam's deleterious impacts upon fish and wildlife habitat on and along Eklutna River. The Eklutna Dam was sold to the utilities, heavily discounted, in a private sale complete with a FERC

[2] McMillen asked Eklutna, Inc. for cost estimates advice due to our team's experience in construction and land development.

licensing workaround. Even with that head start, the Project Owners fail to save or plan for the future of the Eklutna River. The result of this level of myopia in the corporate world often results in bankruptcy or plummeting stock prices. Here, the lack of planning and foresight results in the Project Owners advancing the lowest cost and lowest benefit approach to compensate for more than 30 years of neglecting their responsibilities while the Eklutna and ratepayers cover the costs.

VII. Eklutna River Public Access

We would like to note there is public access to the Eklutna River through the Eklutna, Inc. permit system. Historically, we have provided free public access to our lands. Page 58 of the Program incorrectly states there is currently no public access to the Eklutna River that would prohibit new recreational opportunities for fish returning to the Eklutna River. The Project Owners were corrected several times in meetings that Eklutna lands are accessible to the public. With statements like this still included in the Program, it just goes to show the lack of rigor and attention to detail in this process.

VIII. Inadequate Alternative Analysis

We are also disappointed, yet unsurprised, by the option selected by the Project Owners; however, we are more disappointed with the analysis in the draft document. It is extremely unusual for a preferred option to be advanced in a preliminary plan without fully evaluating each viable option for the public's review. Typically, in a planning or project document, a suite of 3-4 options is identified, and each option is discussed and evaluated through a series of criteria, on a point-by-point basis, leaving the public with an opportunity to review the case for each option. Options forwarded by the federal agencies and the Native Village of Eklutna were not thoroughly evaluated under the same criteria the Portal option was given. Thus, the public reviewing the Program only received a serving of the benefits on the AWWU Portal while the other options were summarily dismissed. This is not dissimilar from the eight public meetings where a representative of the Project Owners focused on the merits of the preferred alternative while deriding the other options. For the Program to be legally-defensible, a full evaluation of each option – now including dam removal – should be included in the Program. By only forwarding analysis of the AWWU Portal option, it is our believe the Program is ripe for legal challenge as it rendered this multi-year planning process moot by not explaining each viable option and explaining the reasons for a preferred alternative based on a critical, purposeful evaluation of what the Agreement parties and working groups advanced to Project Owners.

IX. Request for Eklutna River

Six years ago, Eklutna, Inc, and partners removed the lower Eklutna Dam – an artifact of an initial violation of rights of the Eklutna people. Eklutna, Inc. and the Native Village of Eklutna have worked with US Environmental Protection Agency and US Army Corps of Engineers to remediate the Camp Mohawk contamination. The Alaska Railroad stopped mining the Eklutna Knobs and returned the land to Eklutna where we host youth cultural camps and pow-wows for the general public. The need to reconcile past harms have been recognized and addressed by

most public entities. Now, this is the time for the Project Owners to meet the intent of the 1991 Agreement's obligation and invest in our community's future.

The Eklutna, Inc. Board of Directors strongly urge the Project Owners to prioritize the concerns raised in our comments and work collaboratively with us towards solutions that ensure the sustainable development and preservation of the Eklutna River ecosystem. A solution where the Eklutna River is fully-connected from the Eklutna Lake to the Knik Arm/Cook Inlet is our desired outcome. If additional time is needed to continue negotiations and evaluations on how to reach the desired outcome, we support delaying finalization of the Program and delivery to the Governor for up to three years to ensure the outcome is sensible for our community.

In order to further outline our position on the future of the Eklutna River, we welcome the opportunity to meet with the Project Owners. Please feel free to contact the Eklutna, Inc. CEO, Kyle Foster, at 907-696-2828 or kfoster@eklutnainc.com.

Sincerely,

Michael Curry

RE: Eklutna Hydroelectric Project Draft Fish and Wildlife Program

Friends of Fish Creek (FOFC) is an Anchorage-based non-profit with the mission to daylight (restore underground waters of the creek to the surface) and rehabilitate the creek, making it possible for Coho to once again inhabit and spawn in its waters.

We wholeheartedly celebrated the removal of the lower Eklutna dam, accomplished by a partnership of the Native Village of Eklutna and environmental NGOs. It was one step forward in restoring Eklutna River, which has been dammed for 100 years, to the detriment of traditional salmon runs and Eklutna's Dena'ina peoples.

As well, we wholeheartedly support the removal of the upper Eklutna dam and the restoration of its waters, which will have the beneficial effect of welcoming the river's salmon home. We believe dam removal to be the legal obligation of the Utility in order to mitigate the project's negative impacts to fish and wildlife.

The Utility's proposed plan fails to consider removal of the upper dam, which constitutes a fundamental flaw in the plan. As such, FOFC is encouraged by the unanimous resolution passed by the Anchorage Assembly on 2 February of this year to pause the plan for two years in order to address this.

The current proposal will also leave one mile of river without water and releases only 3-4 percent of historic flow, without which, fish passage is impossible without additional infrastructure, such as fish ladders.

Current electrical output is minimal from the dam and can be reasonably replaced by renewables like wind and solar within a decade.

Without dam removal, fully connecting the rive,r and returning water flow, negative impacts to fish will remain and obligations set forth in a 1991 agreement between the Native Village of Eklutna, the State of Alaska, the hydroelectric project owners, and the federal government to address the environmental damage will go unfulfilled.

For these reasons, we stand with the Native Village of Eklutna, the Anchorage Assembly, and the environmental groups who want to see removal of the upper dam. Further, because the proposed plan fails to consider dam removal, we also support a two-year pause and reset.

Thank you for the opportunity to comment on this important issue.

Respectfully,

Karen Button, board president

Re: Eklutna Hydroelectric Project Draft Fish and Wildlife Program

I write today on behalf of the Kenaitze Indian Tribe, a federally recognized Tribal government with operations within view of the mouth of the Kenai River, in Old Town Kenai, Alaska, one of the most productive salmon producing rivers in the state. We call ourselves the Kahtnuht'ana Dena'ina – the Kenai River people – to recognize the source of the salmon that have nourished our bodies, minds and souls since time immemorial. Today, the Tribe has more than 2,000 members and provides services to about 8,000 Alaska Native and American Indian people. Our traditional lands are bordered by those of the Ninilchik Village Tribe to the south and the Native Village of Eklutna to the north.

It is with the traditional Dena'ina Value of Nagh'utdalts'ina – "respect for our neighbors and others" – that the Kenaitze Indian Tribe supports the removal of the Eklutna dam and restoration of the Eklutna River. Our Tribe specifically supports the Native Village of Eklutna (NVE) Eklutna River Restoration goals, as stated in NVE Resolution 2022 – 4; "Łiq'a nagh qinqtudeł - We are hopeful the salmon will return to us." These goals include "1) continuous flow in the river below the lake sufficient to support thriving salmon populations, with intermittent higher, habitat maintenance and re-creation flows, 2) salmon passage between Eklutna River and Lake, and 3) moderation of Eklutna Lake level variability, at levels sufficient to facilitate sockeye spawning." The Kenaitze Indian Tribe also supports the earlier comments submitted by NVE, the National Tribal Water Coalition, and other Alaska Native Tribes.

Our Tribe is fortunate to live near a huge flowing river that the salmon return to each summer, as they have for multitudes of generations. As a result, our members can use traditional methods to harvest fish, to stock their freezers with subsistence foods, and to share their cultural way with the next generation. Unfortunately, our sisters at NVE do not have that same ability, and the plan put forward by the electric utilities will not change that. Instead, the utilities' preferred option would leave a mostly dry river for nearly a mile between the Anchorage water supply pipe and Eklutna Lake. This alternative is insufficient to restore historic salmon habitat, including the main channel, side channels, and off channel habitat, which studies have shown still provide abundant potential sockeye spawning habitat if only there was water flowing through them. Moreover, fish could still not pass to sockeye habitat in Eklutna Lake and chinook and coho habitat in the Lake tributaries. This

alternative would not restore historic wrongs and it ignores the advice, options, and requests of NVE and other groups.

We ask that you adopt NVE's proposed alternative to remove the dam and restore the Eklutna River flow for the entire length of the river. This alternative would still allow water to be used for the City of Anchorage and for some power generation, but also allow the Tribal community to return to its traditional ways on its traditional lands.

Duk'idli, respectfully,

Chelsea Hendriks
Interim Executive Director
Kenaitze Indian Tribe

To the Owners of the Eklutna Hydroelectric Project,

This comment is in regard to the Eklutna Hydroelectric Project's Draft Fish and Wildlife Program for the Eklutna River. I do not believe that the plan's proposal to utilize the existing Anchorage Water and Wastewater Utility (AWWU) water supply infrastructure meets the needs of salmon, the vision of the Native Village of Eklutna, or your legal obligation to mitigate the project's impact on fish and wildlife. I support the Native Village of Eklutna's vision for river restoration and ask you to consider dam removal or another alternative that will fully reconnect the river and return the water flows needed to support the river's fisheries. As an Anchorage resident, utility payer, and water drinker, this is also my vision - undoing the damage caused by this project in the first place and restoring the Eklutna River and its salmon runs.

The current proposal leaves a mile of the river dry, releases only 3% of historical flows, and does not provide fish passage into the lake and upstream habitat. Salmon populations will only recover with a reliable and consistent water supply and access to crucial upstream spawning and rearing areas. This proposal is unacceptable and needs to go further to restore the river's salmon runs. I attended one of the public comment meetings in Anchorage in January and spoke with you - the project Owners. You stated that your main concern for increasing flows to the river beyond what is in the draft proposal is the threat of erosion to pipe infrastructure underneath the river channel. When I asked you for specifics about this, you could not provide details on how various flow rates might affect the pipe infrastructure. You also could not provide information on any studies that you undertook to understand engineering or other solutions that might mitigate this risk of erosion while returning life-sustaining flows to the river. Given the mandate of the 1991 Fish and Wildlife Agreement, these are unsatisfactory answers and I implore you to do more research before making such an impactful decision.

I do not believe that the draft proposal and studies included by the out-of-state consultant took into account sufficient data and knowledge from the Native Village of Eklutna. When I asked one consultant about their process for understanding pre-dam salmon levels in the river, they gave many reasons why this number is so difficult to quantify and then outlined their process of sampling the lake, which gave them a range of population numbers. When I asked if they talked to the people with knowledge and experience fishing that river before the dam went in, they acknowledged that oral histories tell them that there were abundant salmon runs in the river before the dam. And yet the cost-benefit calculations throughout the report leave out this critical piece - the impact of this dam on a generation of salmon runs and a generation of people. The calculations do not include the enormous cultural, social, nutritional, environmental, and economic loss that this dam inflicted. When I asked the consultant if she thought that this was a problem, she sort of cryptically but also very tellingly told me that I was asking the right questions. The draft proposal for the Eklutna River minimizes the concerns, vision, and voice of the Eklutna people. It also minimizes the voices of all of us interested in a balanced solution - one that provides clean water, a restored ecosystem with salmon runs, and a future of renewable energy. I believe that we can do better than this proposal to strike that balance.

The Native Village of Eklutna has communicated its vision for thriving wild salmon in the Eklutna River. Dam removal looks to be the most effective way to achieve this important goal. I understand the reliance on this hydroelectric energy source in the near term. That said, I believe that the numbers were misrepresented in the public meetings - the power coming from the hydroelectric dam as a percentage of renewables is just 2 - 3% of the electricity on the grid as a whole. I support the plan to remove the dam within the next decade when replacement renewable energy is expected to be available. We cannot continue to rely on a system that is inflicting harm and pretend that it is without consequence. Can you imagine if there was a proposal, in 2024, to dam the Kenai River for hydroelectric power, eliminating the sport and subsistence fisheries there? It would never happen. This is a once in a generation opportunity to come together with a bold, forward-thinking, responsible vision to restore a cherished and beloved river system and mitigate the harm caused to its people, its salmon, and its ecosystem. It is a once in a generation opportunity to work hand-in-hand, and in good faith, with the Native Village of Eklutna. I urge you to reconsider the draft proposal which disappointingly fails to prioritize salmon return or the voice of the Native

Village of Eklutna.

Thank you for considering this comment.

From:	Mary Langdon
To:	Sam Owen
Subject:	public comment on hydro project
Date:	Thursday, February 15, 2024 6:19:55 PM

I am writing in strong support of returning the Eklutna River to its original free-running state, from the lake to the inlet, as per the vision of the Native Village of Eklutna's proposal. I have reviewed the Eklutna Hydroelectric Project Draft Summary of Study Results, US Fish and Wildlife Service comments on the same, as well as the Native Village of Eklutna's vision and proposal per their 4 December 2023 letter to Samantha Owen. I was not able to attend any of the public presentations, though my sister was able to and gave me feedback.

By way of background, my family came to Alaska pre-statehood, and my husband and I maintain a home in Anchorage.

I understand the Assembly has requested a two year extension on the project plan process. I sincerely hope this is granted; and, if granted, there is an on-going communication with the public about this process.

I agree with Assemblyman, Kevin Cross' statement (from APM article dated 6 FEB 2024): "If you're a small, limited government human being like I am, then you should be very concerned and angry about what we did to Native Village of Eklutna – just, honestly," he said. "Now, we've been very blessed and we've benefited from it ever since. Anchorage has benefitted wildly from the wrongs we have created. It's not a justification for why we can't move forward."

There's far too little of his thinking in government agencies and elected officials. I believe moving forward means returning the river back to its original state.

Re-Wild the river! Bring back the salmon!

From:	Nelli Williams
To:	Sam Owen
Subject:	Eklutna comment
Date:	Monday, February 19, 2024 9:57:47 PM

I live in Anchorage and am a Chugach Electric Association rate payer. Our family are avid outdoor adventurers, anglers, and hikers and the Eklutna area is one of our favorite places to play within an easy drive of Anchorage.

I have been following this issue closely for many years and am disappointed in the owner's draft fish and wildlife program. It doesn't meet the terms they agreed to in 1991, and spends millions of dollars without meaningfully helping salmon, an important local river and many, many families.

There has been a lot of scientific input that has been ignored thus far. I encourage the owners to go back to the drawing board and put for a plan that's based on science, upholds the vision of NVE and makes a meaningful attempt to bring back the salmon runs that have been severely impacted by this project.

We have a once in a generation to restore a river that all Alaskans can be proud of...right now we are simply heading down a path to throw good money after a bad, inadequate idea (the AWUU portal option).

I support the idea that NVE, TU others have brought forward - removing the dam. While there are still questions that need to be answered, there have been numerous successful dam removal projects all over the country. While complex, dam removal is doable and likely our strongest return on investment. Removing the dam is also very likely the most cost effective with the community partners that have stepped forward to help with that effort.
The utilities current proposal is a short cut to a dead river, continues to short-change the Native village of Eklutna, and doesn’t make a whole lot of economic or logistical sense. Let's work on a creative forward-looking solution that gets us to the salmon-filled future that Alaskans want. We can do better.

Sincerely,

Nelli Williams

To:	Sam Owen
Subject:	Remarks opposing draft, "portal-valve" proposal for Eklutna Hydro project
Date:	Monday, February 19, 2024 3:20:58 PM

To Those It Concerns —

I am writing to comment on the draft proposal by several utilities & agencies for partial restoration of the Eklutna River.

I oppose the current draft proposal and instead support full restoration of the river, which includes removal of the dam at the lake outlet. This alternative is supported also by the Native Village of Eklutna and the Anchorage Assembly.

The citizens of Anchorage, including the village of Eklutna, have a precious opportunity to reverse the damage done to the river and the fish it supports, and we should take full advantage of it. The concept of "rewilding" — returning some segments of our physical environment, of the land we live on, to a state approximating what it was before industrialization and development — should guide our social-economic decisions whenever possible, and restoration of the Eklutna river and the salmon it once supported is a perfect example of the right project, in the right place, at the right time.

The effects of such a change can be mitigated over the next decade:
— additional support structures and/or reinforcement can be added to existing road and rail bridges over the Eklutna River;
— piping for city drinking water can be protected and/or enhanced;
— the loss of electrical power, while of concern, can be made up through continuing energy-conservation measures and additional renewable-energy projects (more wind turbines, for example) throughout the Municipality and beyond.

It is understandable that the electrical-power utilities involved in the Eklutna hydropower project wish to preserve the one-mile stretch of the river directly below the dam. I respect their views and motivations. But the spirit of the 1991 agreement goes beyond its direct call for mitigation of damages and some enhancement of the river and requires restoration in full. Let's do it.

(Because a wrinkle in this process has been created by a secretive pact between the electric utilities and the Anchorage Water & Wastewater Utility to bind the parties to the "portal valve" proposal, my comment here and those of many others may be rendered moot. It's impossible for us to know, at least as of now. Nevertheless, I wish my view of this matter and support for the Eklutna River's full restoration to be recognized as strongly felt opposition to the secret agreement and the draft proposal.)

Thank you.

I haven't lived in Anchorage for many years, but I still live in southcentral alaska (talkeetna,) and i know how fortunate we are to have an opportunity to remove the dam and restore water to the eklutna river. In fact, I thought the decision had already been made to do so. one of the problems with dams is that they reduce or completely eliminate water from the river and, if water is released, temperatures are radically different than natural temperatures. It was my understanding that removing the dam was going to happen and that The conservation fund and trout unlimited would fund the removal. i fully support complete removal of the dam in a timely fashion. I've heard a 10 year time-line, and while not ideal for the fish and wildlife, it would give the project members time to plan and implement other projects. In the meantime, it is imperative to choose an alternative that provides enough water be released that water will flow all the way to knik arm as soon as possible. A true eklutna fish & wildlife program will meet these objectives.

Hello!

I am an Anchorage resident and Chugach Ratepayer.

I am writing in support of the Community Alternative plan as proposed by the Native Village of Eklutna.

The current plan (Draft Fish and Wildlife Program) would create a dead-end river, provide just a trickle of water, leave a mile of dry river, prevent salmon from reaching Eklutna Lake, and jeopardize the Anchorage drinking water system. The operators are legally required to make up for the damage caused by their hydroproject, but their plan doesn't do the job.

Instead, please consider the Community Alternative. I am in full support of this plan and know of many others in the local community who are as well.

Thank you for your attention,

Subject:	Comments on the Eklutna Draft Fish and Wildlife Program
Date:	Monday, February 19, 2024 3:06:34 PM

Dear Ms. Owen and Chugach Board members,

I am writing to support full restoration of the Eklutna River. I'm a fisheries scientist with over a decade of experience working for the Alaska Department of Fish and Game and Tribes in Alaska on salmon fisheries. I currently work as the Restoration Policy Manager for an indigenous conservation organization based on the Klamath River, working with Tribes on post-dam removal efforts. I've also served on the municipality of Anchorage's Watershed and Natural Resources Commission, where we received several presentations on Eklutna River restoration from agency scientists. I've served as the Vice-President, President-Elect, President, and Past-President for the Alaska Chapter of American Fisheries Society and sit on the Advisory Council for the University of Alaska College of Fisheries and Ocean Sciences. I want to address three areas that drive my support for full restoration of the Eklutna River.

1. Full restoration is what the Native Village of Eklutna (and many other community members) want and, frankly, deserve.
The colonial taking of indigenous lands has been and continues to be one of the world's greatest environmental injustices. The construction of the Eklutna dam, the original agreement (and how the Tribe was excluded), the years the owners have let slip by without coming up with a reasonable approach to rehabilitation of the river, and this sham of a public process currently being undertaken is no exception. It is baffling to me that many in Alaska continue to stand by this colonial mindset and refuse to acknowledge the historical trauma that has been inflicted on the Native Village of Eklutna. You have a chance here to right the wrongs of history with full restoration of the river; anything but full restoration will be a choice you're making to instead barrel ahead with continued ignorance.

I'm currently involved in a Department of Energy funded effort called Uncommon Dialogue: Hydropower, River Restoration, and Public Safety, which brings together stakeholders from the hydropower industry, conservation groups, and Tribes to find common ground on hydropower reform in the United States. It is unprecedented to think that these groups, historically at odds, could agree on something, but Uncommon Dialogue showed that it was possible. Through this effort, the group provided joint recommendations to Congress related to hydropower reform that "reflected the groups' shared goals of enhancing the health of river ecosystems, respecting the rights of Tribes, and providing greater regulatory certainty for hydropower facilities". (found here: https://woods.stanford.edu/research/hydropower/hydropower-ucd-core-documents)

While the Eklutna dam is not a FERC-licensed dam and therefore is exempt from federal regulations through the Federal power Act, it was the intention of the original signers of the agreement to adhere to standards equal to the federal licensing process. You have undoubtedly received a number of comments about how you have failed to meet that standard, so I won't belabor that here. Instead, I want to focus on the recommendations made by the diverse group brought together through Uncommon Dialogue and highlight how river restoration and hydropower are being addressed throughout the rest of the country - and how Tribes are being uplifted in the process, rather than trampled or, in Eklutna's case, ignored. In particular, a bi-

partisan bill before Congress now - widely supported by the hydropower industry, environmental groups, and Tribal organizations (see statements of support here: https://www.daines.senate.gov/2023/06/14/what-they-are-saying-industry-and-community-leaders-endorse-daines-bipartisan-hydropower-bill/) - **empowers Tribes and recognizes their inherent decision-making authority to prevent future environmental and economic destruction on their ancestral lands,** and increases the cooperation between among Tribes and federal and state agencies in this effort. A bi-partisan effort in Congress is elevating the voices of Tribes in hydropower issues, while the approach pursued by the project owners here seeks to stifle Tribal input. Why are we doing things differently in Alaska?

There is a clear example for you to follow here and involve and genuinely listen to the Native Village of Eklutna. The rest of the country is showing you the way - will you follow or will you continue to perpetuate the decades-long environmental injustice?

2. Full restoration is the only viable option for restoration of sockeye salmon.
Sockeye salmon spawn in lakes. To restore the Eklutna River sockeye run, they need full, unobstructed access to the lake. Full restoration - ie dam removal - is the only option here.

Unfortunately, the spokesperson for the utilities is trying to mislead you into believing that sockeye salmon never occurred in the lake, citing a study published in 2017. The study examined the nitrogen isotopic signature of sediment cores as a way to document possible historic salmon spawning. My Ph.D. thesis used stable isotopes of nitrogen and carbon to reconstruct the historical food web of the Great Lakes fisheries. I'm quite familiar with using isotopes to study the historical ecology of ecosystems. They can be an invaluable tool, but like most scientific methodologies, they are not without flaws. I won't go in to details, as Rick Sinnot provided an excellent overview of these potential flaws in his editorial in the ADN (https://www.adn.com/alaska-life/we-alaskans/2017/12/02/fishing-for-prehistoric-traces-of-sockeye-salmon-in-eklutna-lake/). No scientific study should ever be interpreted in isolation. That's just bad science. As scientists, we replicate. We conduct other complementary studies. We look at oral history to help inform the results we're seeing for any given ecosystem. And oral history, as provided by the Native Village of Eklutna, tells us that there were certainly sockeye salmon present in the lake. The 2017 study authors state "...we contend that even a conservative interpretation of the model results demonstrates the possibility that sockeye salmon could have used Eklutna Lake before 1929 without leaving a detectable isotopic signature." Nevermind that kokanee - which are landlocked sockeye - are present in the lake today, most likely a relic of the historic anadromous population. If kokanee are present in any appreciable numbers, it's because of a relic population - not because someone threw a few sockeye in the lake at some point. The takeaway here is that the spokesperson for the utilities is not providing the full story and is cherry-picking from the study they are citing to serve utility interests. Please do not be duped.

3. Full restoration is, indeed, economically and logistically feasible.
Thanks to the generous offer of environmental groups, full restoration of the Eklutna River is, in fact, the most economically feasible option. The utilities won't have to pay a penny to remove the dam - far better than the utilities/ratepayers on the Klamath River which, by the way, are removing the dams because it was cheaper than building fish passage facilities to come in compliance with federal law... and because of widespread public support, not unlike the situation on the Eklutna River. And logistically speaking, it will be a relatively minor lift compared to other river restoration efforts happening around the country. If the power companies, state and federal agencies, Tribes, environmental groups and other stakeholders

can come together to remove (much larger and multiple!) dams on the Elwha and Klamath Rivers, then we can realistically remove a small, single dam on the Eklutna River.

Claims that removing the dam and AWWU winter water withdrawals would cause the river to dry up at times are - to date - not backed up with credible, reviewable science. It's impossible for any reputable hydrologist to review these claims by the project owners given the lack of transparency around their analysis. And in my professional opinion, the analysis does not seem to take into account changes in lake levels with predicted climate change impacts in Alaska. Models are showing higher winter lake levels in Alaska, as winter precipitation shifts from predominantly snowpack to more rain (https://www.nps.gov/articles/aps-19-1-10.htm), which would offset AWWU winter withdrawals.

I strongly encourage you to slow down your process and work with the Native Village of Eklutna to achieve a common, shared objective of rightfully returning salmon to the ecosystem while meeting water and power needs for the municipality. There are numerous examples to learn from where utilities, agencies, and Tribes are working together in the L48 on these same issues. I can't think of what would hold you back from taking a more thoughtful, holistic approach, can you?

Thank you for your consideration,
Dr. Stephanie Quinn-Davidson, Ph.D.
Fisheries scientist
Restoration Policy Manager, Ridges to Riffles Indigenous Conservation Group

Hello,

I'm writing to submit my opposition to the utilities' recommended option called the "portal valve alternative". This option has some unknown impacts on anchorage's drinking water system, plus it has know impacts on preventing salmon access to eklutna lake and its tributaries.

I much prefer the alternative suggested by the native village of eklutna and others that recommend full eklutna dam removal in 10 years or so once other energy sources come online to replace some of the loss of hydroelectric generation. Its a conservative proposal that addresses most concerns.

I remember when utilities proposed a hydro electric project on the snow river in the kenai peninsula a few years back. The public response was clear: we didnt want to SACRIFICE a salmon fishery for electricity. I believe the same applies to eklutna.

Additionally, many groups have worked to open up and enhance salmon habitat in upper cook inlet, including the Mat-su Bourough (fish passage culvert program), mat-subasin salmon habitat partnership, and the Mat-su fish and wildlife commission as a small sample. The portal valve alternative counteracts all these efforts, the NVE proposal doesnt.

Finally, as a fisher and recreational user of eklutna lake, i want to see a restoration of this ecological system to what it was. Additionally, with the closed door negotiations the utilities have done with the A.W.W.U. I dont exactly trust my utility these days. If it quacks like a duck…

I oppose the portal valve alternative for these reasons, and suggest you forward the native village of eklutna proposal and restore the full length of the eklutna river by removing the eklutna lake dam and allow full access to the eklutna lake and tributories to anadromous fish.

Please make my comments part of the public record. Thank you.

To the Esteemed Officials and Stakeholders,

I am reaching out to articulate my profound reservations regarding the "AWWU Portal" initiative proposed by The Owners. This plan, targeting the mitigation of the Eklutna River, starkly misses the mark in addressing the essential ecological requirements of the river and its historic salmon populations. The Eklutna River, with its legacy of supporting all five species of salmon, is a jewel in our ecological and cultural landscape, a fact that the proposed project fails to honor adequately.

The foundation of the 1991 agreement was to ensure the preservation and restoration of the Eklutna River's ecosystem to a state as close to its original condition as feasibly possible. However, the AWWU Portal proposal diverges alarmingly from this foundational goal, presenting a path that risks the ecological integrity and the rich cultural history tied to the river. Ignoring the critical need for a diverse and thriving salmon population in the river does a disservice not only to the ecosystem but to our community's heritage and future.

Understanding the species composition of the Eklutna River before its alteration poses challenges, yet the oral histories and traditions passed down from our indigenous communities offer a rich tapestry of knowledge. These stories are not mere anecdotes; they are testaments to the river's historical biodiversity and a guide to what restoration should aim to achieve.

The necessity of a vibrant river ecosystem, particularly for sockeye salmon fishing near Anchorage, cannot be overstated. The Kenai River serves as a testament to the socio-economic benefits of such ecosystems, showcasing the potential for Anchorage to harness similar benefits. A revitalized Eklutna River would not only enrich our community with natural beauty and recreational opportunities but would also serve as a crucial economic asset, much like its counterpart.

While I recognize the utility's objective to maintain affordable rates, it is crucial to embrace a broader vision—one that considers the paramount importance of sustaining our environment and, by extension, the Anchorage and Alaskan economy. This vision requires a commitment to solutions that foster all aspects of our community's well-being, from ecological health to economic vitality.

Moreover, the opportunity to leverage federal grant funds for this project should not be overlooked. Numerous federal initiatives aimed at environmental restoration and sustainable infrastructure offer financial resources that could mitigate the costs associated with more comprehensive and ecologically sound mitigation strategies. Investing in such solutions would not only align with the original goals of the 1991 agreement but also stimulate our local economy through job creation and long-term economic benefits.

In conclusion, the AWWU Portal proposal is insufficient for the monumental task of restoring the Eklutna River to its rightful state. I strongly advocate for a reconsideration of this approach in favor of a strategy that fully embraces the return and prosperity of all five salmon species. Such a strategy should honor our indigenous heritage, contribute positively to our economy, and seize the potential for federal funding to support these endeavors.

Let us choose a path that reflects a deep commitment to our environment, our economy, and our community's future. I urge you to seek an alternative that aligns with the profound spirit of the 1991 agreement and the collective aspirations of our community.

Thank you for considering this critical matter. I am eager to see how our collective efforts can lead to a sustainable and flourishing future for the Eklutna River and our community at large.

Warmest regards,

Valeria Foster

B-6. Against Dam Removal

Subject: Keep the Damn Dam
Date: Thursday, November 2, 2023 8:13:23 AM

Good morning and thank you for taking the time to review my comment. I am a voting Chugach Electric member and homeowner in Anchorage.

With dwindling natural gas supplies, rising electricity costs, a warming planet, and hundreds of undammed rivers across this state, it's incredulous to me to think that we're seriously considering removing a reliable source of renewable energy from our electricity portfolio.

I generally support the Anchorage Assembly, but do not on this topic. I grew up in Washington State which has 80%+ of its power coming from renewable energy AND has some of the lowest power costs in the nation. It is because of its hydroelectric resources that it can accomplish is.

Furthermore, the Municipality has a Climate Action Plan that has been sitting on a shelf, collecting dust, not being acted on or taken seriously while the Assembly and Mayor squabble over homelessness. I find it offensive that our "progressive" elected leadership is taking time and effort to weigh in on this issue without offering any reasonable alternatives AND acting upon them.

It feels to me like this yet another example of "playing politics." Let's return the salmon to the stream without removing the dam. Let's build more dams that do not block salmon runs. And let's quit burning fossil fuels. Real leadership would accomplish this.

Subject: Leave the Eklutna dam as it is
Date: Wednesday, January 10, 2024 11:01:27 AM

Please leave the Ekluta dam as it is. The electric co-op utilities have/are spending millions of dollars enhancing water flow in the river at the expense of cheap electricity and drinking water for Anchorage. Do not give away this fossil fuel free, power on demand, environmental friendly part of our electric grid. The utilities recently received a 50 year extension to their permit from the federal government.

This is a valuable asset owned by all the co-op electric utility members in the rail belt area and it is the cheapest supply of electricity in the rail belt area. Do not trade it for the several hundred fishermen who might catch a fish in this river. There should be a cost analysis for dollars to remove and energy lost versus each fish that could be caught.

The governor has committed to Alaska to have 50% non fossil fuel free electrical grid by 2050 This asset is already constructed and upgraded and will cost millions of dollars to remove. Lets evaluate dam removal the next time the dam is up for permit renewal.

What's next? Remove dams at Bradley Lake and the dams in Southeast Alaska?

I have two CONCERNS ABOUT REMOVING THE HYDRO DAM. THE FIRST IS THAT MOST OF THE DRINKING WATER FOR ANCHORAGE COMES FROM EKLUTNA LAKE. HOW IS THAT GOING TO BE ADDRESSED?
THE SECOND ISSUE IS THAT HYDRO IS A CHEAP GREEN ENERGY SOURCE. WE GET A TREMENDOUS AMOUNT OF CLEAN POWER FROM THE HYDRO DAM. WE SHOULD BE ADDING TO CLEAN ENERGY POWER, NOT TAKING THEM AWAY.
MY QUESTION IS, HOW MUCH MORE COAL AND GAS WILL NEED TO BE USED TO REPLACE THE CLEAN ENERGY FROM THE HYDRO?

I strongly support leaving the dam in place, this benefits most of the people in Anchorage and the rail belt. We have the best drinking water in the country and low cost, renewal power generation. Eklutna is also a wonderful, accessible recreation area. Please do not remove this asset. Thank you, Keith Sopp 99502

As a former powerplant/gas handling facility operator for Taps in Valdez, I Encourage both MEA and CEA not to be bullied by the eco terrorist. REnewable energy via wind and solar is a joke. Natural gas is in abundance in Alaska, especially on the north slope, which should be utilized for local power generation. There apparently is the MEA natural gas power plant in eklutna as well to supply needed power to the valley and anchorage. Generally, few fish migrate into a glacier fed lake unless there is fresh water sources. Perhaps the eco terrorist prefer to collapse Alaska's economy and reduce population via progressive, unreliable, UNREALISTIC measures?

CAUTION: This email was received from an external source

I have been in Anchorage since 1968. The hydro. Project has been the most stable source of electricity we have. At the time environmental impact statements were done. Due diligence was used. It is as green a project we have ever had. It seems foolish, and not cost effective to remove it. There are fish in the river, I have fished there myself. If additional ladders and such need to be added do so. But we can not afford tearing this down, when it is one of the only consistent and reliable sources of energy we have. It was green before anyone was worried about it. It is counter productive to WAste funds to remove this dam only to have to build another. If it were damaged that's another issue, but until then, please use common sense and let it remain.

Subject: New Message From Eklutna Hydro - CONTACT US
Date: Tuesday, January 16, 2024 11:36:36 AM

CAUTION: This email was received from an external source

I am against removing the Eklutna Hydro plant. Water for Anchorage and cheap clean energy for citizens is essential. REmoval of the DAm would also lead to flooding of area surrounding the Eklutna lake, destroying trails and camp areas as well as displacing fish and animals in the local habitat.

Public Comment Regarding Removal of the Eklutna Hydroelectric & Water Dam
by Fr. Randy Hillman, MEA Member and members of
Valley Anglican Fellowship Church who are also MEA members.

January 16, 2024

To: Whom it may concern: Mr. Tony Izzo, MEA CEO,
and other MEA Board Members

First, thank you, Mr. Izzo, for allowing the MEA members to express our opinions on the Removal of Eklutna Hydroelectric and Water Dam (Eklutna Dam) via email, info@Eklutnahydro.com ,

Mr. Izzo and fellow MEA Board members, a long time ago I was in Nuclear Physics and worked with radioactive materials and NBC warfare in the US Navy. I am also speaking with input from the church members. That being said, I cannot see how the Removal of the Eklutna Dam will help improve anything or anyone . To the contrary, the Removal will also cause more harm to the Environment in many ways; as well as, the discussion on the replacement of the electric power and a water source to the growing water needs of the largest city in Alaska, Anchorage.

Let us discuss the many ways the destruction of the Eklutna Dam harms the Environment.

1. **Where will MEA and Chugach Electric Association replace this renewable, carbon zero, scalable base load power? The Wind Turbines on Fire Island are not working and are being subsidized by the members at an additional cost for no value. They kill birds! Microreactors (Nuclear) Power plants are not available now and nor will they will be available in the near future. See then Department Of Energy's December 13, 2023, report.**
2. **The Carbon Dioxide generated from the equipment to remove Eklutna Dam is how much? It's definitely not "Net Zero", as it is now.**
3. **The Environmental impact from the waste from the removed concrete, which in itself has a great deal of Carbon from the manufacturing to the installation of the Eklutna Dam's concrete.**
4. **Where will the old removed concrete be placed? Again, Carbon Dioxide will be emitted from the destroyed Eklutna Dam's wasted/old concrete.**
5. **Are there any material(s) that are Environmental Hazards that you know for a fact are not in Eklutna Dam? If so, what kind of workers Personal Protective Equipment (PPEs) will be used, and what kind of Environment Abatement will be used? Can the people and property be safeguarded from any downwind emissions of Hazardous particulates?**
6. **Environmental Hazardous waste will be transported to and stored where? What will be the cost now and the cost for future storage?**

Now, let us discuss the Impact on the Loss of a Clean, Renewable, Carbon Zero and Scalable Base Load Electricity on the Mat-Su.

1. **The Loss of this Clean, Renewable, Carbon Zero and Scalable Base Load Electricity in the Mat-Su will impact Every Citizen (approximately 125,000 people) from Student Education to the Pumping of Water to survive and everywhere in between.**

2. **The Loss of this Clean, Renewable, Carbon Zero and Scalable Base Load Electricity will impact every Citizen multiple times from the Rising Costs of Electricity that we personally use as well the additional retail costs that will be passed on to the consumers as the cost of doing business.**
3. **What does the MEA Board have planned to replace the Loss of Eklutna Dam's Electricity when additional Electricity will be needed for the growing Mat-Su area that is Clean, Renewable, Carbon Zero and Scalable Base Load Electricity before Eklutna Dam is removed so there isn't any Electrical Power disruption?**
4. **As MEA members, how much monetary Refunds should we expect (not in future power credits) from Electric power disruptions as Mat-Su Citizens, Retail Users, Both Routine and Emergency Communications from the Loss of Eklutna Dam's Electric Power?**

In Conclusion

I do not believe this would be in the best interest of any MEA members to Remove the Eklutna Dam. Even though the "Environmentalists" do not consider Dams as a part of Carbon Reduction or Renewable Energy, where it truly is.

However, as a MEA member, I believe that Eklutna Dam should be upgraded so that the Dam could withstand and/or resist an Electromagnetic Pulse (EMP) and be able to have the ability to provide Electrical power within a short time period which may or may not affect National Defense (see Oak Ridge National Laboratories, appendix on HEMP/EMPs & the EMP Commission of Pres. Obama administration). The new modification should include a Fish Ladder for the migration of Fish.

Further, as a MEA member, I recommend that the MEA Board revisit building the Susitna River Dam project because of the ongoing issues in providing Clean, Carbon Zero, Renewable, Scalable Base Load Electric Energy, and designing it also to withstand or be resistant to an HEMP/EMP. The Susitna Dam should include in its design a Fish Ladder for the migration of Fish. The construction of the Susitna Dam would supply around or more than 300 MWs of Electrical Energy depending on what capacity the utility-scale electric power generators are operated.

Respectively Submitted,

Fr Randy Hillman

Subject:	Comments for the record
Date:	Tuesday, January 16, 2024 9:42:56 PM
Attachments:	image001.png

Good day,

My name is Rick Whitbeck, and I am a nearly 40-year Alaskan and current Chugach ratepayer. I have thoughts on the proposed alternatives under the draft Fish & Wildlife plan as found on the Eklutna Hydro website.

To expand on those, I've written two opinion pieces that have been recently published. The first is on Must Read Alaska here:
https://mustreadalaska.com/can-the-eklutna-dam-be-removed/

And the second in the Anchorage Daily News here:
https://www.adn.com/opinions/2024/01/14/opinion-keep-the-eklutna-dam-as-it-is/

I'd ask that both pieces be made part of the record for the purposes of advancing the draft-to-final process for the Fish & Wildlife plan for Eklutna.

Should you need additional information or have questions on my content, please reach out at the contact info found below.

All the best,
Rick Whitbeck

CAUTION: This email was received from an external source

To whom it may concern, I am writing in support of preserving the Eklutna Hydroelectric powerplant. Hydro is the only reliable year round renewable power source. I am in favor of the smaller release of water into the eklutna river for the salmon but not if it impacts the hydroelectric and the salmon fishery that is established at the eklutna tailrace. I do support the creation of additional hydroelectric powerplants. there are people saying that the eklutna river fishery could be a world class fishery serving all alaskans. To counter this notion is the fact that there is no infrastructure or parking to support the thousands of people that may or may not fish the eklutna river.

From: Richard McClure
To: owen@mcmjac.com
Subject: New Message From Eklutna Hydro - CONTACT US
Date: Friday, January 19, 2024 7:50:25 AM

CAUTION: This email was received from an external source

The removal of the eklutna lake dam makes no sense. Currently you have a good king and silver salmon sport fisheries at the eklutna tail race and you want to replace it with a marginal sockeye run that would have to be supported by a hatchery. what clearwater creeks flow into eklutna lake that would support suitable habitat for sockeye to spawn in, bold creek, hardly. Let alone the sterile water of eklutna lake laden with glacial silt where they could not grow to suitable size before they migrate out.
Do not remove the dam, hydropower is our best source of proven clean energy. no co2 emissions.

To: Sam Owen; Sam Owen
Subject: pulbic comment
Date: Saturday, January 20, 2024 5:33:52 PM

I think the dam should be left in place. Hydro power is the least expensive power there is. And we don't even have to build anything, it's already there. Removing the dam would be the least green thing we could do.

As for concerns about honoring indigenous cultures, we can erect a monument next to it. I recommend a beaver themed monument. Recently there's been little Native monuments erected at Potter Marsh, West Chester lagoon, and Pt. Woronzof. Erect one of those next to the dam and this will suffice in protecting it as a cultural resource.

Subject: Dam at Eklutna
Date: Tuesday, January 23, 2024 3:00:21 PM

I support leaving the dam in place, in this case. Since 25,000 customers receive cheaper power from it versus millions of dollars to remove it, I say let it stay. Alaska has hundreds of other waterways for salmon to run freely. The removal makes no sense.

I am a 43-year resident of Anchorage, an avid environmentalist, a taxpayer, and a super voter. Make the economically sound choice and leave the Eklutna dam in place to help those who benefit from the power. Lucky us to have this great water from the lake, too.

I have been updating myself on the Eklutna Hydro project by attending one of the public meetinings and browsing the project information on this website. I understand that the current project as it stands provides 90% of the moa's water and 6% of the railbelt power. The two remaining proposals both appear to be not only unnecessary but damaging. The optimistic virtue signaling of removing of the dam is by far the worst and the reduced politically correct version of cutting the electric output to the utilities on the railbelt is not only going to negatively affect the ultility consumers but also the tax payers in the moa. To get rid of or reduce the cheapest, and the most acceptable power produced in the rail belt is pandering to the woke and radical left wing of alaska politics.

There is no proof that salmon ever used the Eklutna river or lake outside of the convenient folk lore of the eklunta natives. According the the science associated with the lake, the lake has always had way too high a tribidity to raise fish. This dates back as far as records exist and is present today. Planted fish are starving to death because the lake can not produce enough food for thier survival. This condition will not change no matter what is done with the river. There is currently very little shoreline that would support spawning and little could be added.

In summary, don't fix something that isn't broke. Higher rate base, higher taxes do equate to spending millions of dollars to prove that stocking fish at trailRace is supplying more fishing than the river or lake ever did.

From: Laura Walter
To: Sam Owen
Subject: New Message From Eklutna Hydro - CONTACT US
Date: Thursday, January 25, 2024 10:35:21 AM

I believe That the Eklutna dam should remain in place and continue to supply Anchorage with water and power. It is considered clean power for over 24,000 residents and supplys 90% of the water for Anchorage use.

Looking at the studies on the fish (pages 32 and 33 of the Eklutna Hydroelectric ProjectFish Species Composition and Distribution
Year 2 Study Report Final) it appears that the fish do better where the water is moving slow. They seem to do just fine.

I see no benefit in removing the dam.

To: Sam Owen
Subject: Eklutna Hydropower
Date: Thursday, January 25, 2024 10:47:39 AM

Never has there been a greater need for carbon free power. The loss of Eklutna Hydropower would impact the power and water utilities. The electric utilities losing the hydropower will need to use more natural gas power, more carbon emissions and greater financial cost. With the increase use of natural gas rates will increase. More power would be required to pump water from the wells needed for Anchorage. Can the water utility wells keep up the increase in demand?

IT IS RECKLESS TO SUPPORT REMOVAL OF THE DAM AT THE VERY TIME INTENSE EFFORTS ARE BEING UNDERTAKEN TO TRANSITION FROM FOSSIL FUELS TO RENEWABLE RESOURCES FOR ELECTRICAL GENERATION. HYDROPOWER IS THE BEST SOURCE FOR FIRM POWER TO SUPPLY POWER WHEN THE WIND DOES NOT BLOW OR THE SUN DOES NOT SHINE. GIVEN THE HIGH COST OF AND RESISTANCE TO ANY NEW HYDRO OR NUCLEAR, THE HIGH COST AND UNCERTAINTY OF TIDAL GENERation, and the high cost of battery storage, it is irresponsible to even consider taking the dam out. How much and how would the eklutna hydro project output be replaced? This cost has to be factored into any decision to remove the dam. In ADDITION, DAM REMOVAL WOULD POSE RISKS AND COSTS ON ANCHORAGE'S WATER SUPPLY. FINALLY, I SUSPECT THAT THERE IS CONSIDERABLE UNCERTAINTY ABOUT HOW MUCH, IF ANY, SOCKEY SALMON RUNS WOULD ACTUALLY BE REVITALIZED. I UNDERSTAND THE EMOTIONAL ATTACHMENT to salmon, NATIVE HERITAGE AND NATURAL RIVERS (I am a long-time river runner, love salmon, and appreciate native sentiment), but these factors are SWAMPED by the reasons for keeping the dam.

To: Sam Owen
Subject: New Message From Eklutna Hydro - CONTACT US
Date: Sunday, January 28, 2024 7:09:26 PM

I would like to follow up on comments I made a couple weeks ago. After finding out there were only 70 members of the eklutna tribe, it seems inconceivable to me that removing the dam is not feasible at any level. Eklutna provides most of the water for Anchorage and electricity in a substantially green way. It would be cheaper in the long run to pay a royalty to these 70 folks. As I stated before I have fished the area, and there are fish, but in this case the needs of the many must take precedence. To redesign or replace aspects of this project and tear down the dam is too costly at a time we don't have the funds and cannot afford increased rates. Removing the dam will affect the lake levels as well , our water supply, and the recreational use of the area. Sadly progress and population affect natural habitat, but so has the pipelines and their impact was offset by royalties. I think this would be appropriate for the 70 members in this situation. Anchorage has so many problems power wise, we do not need additional ones and loss of water.
Thank you

Subject: Closing the Eklutna Dam
Date: Monday, January 29, 2024 12:26:10 PM

I am strongly apposed to closing the dam.

The dam generate a great deal of power for the area and the valley. From what I understand that's about 6%. We have enough issues with power, why make it harder to have.

The lake is the biggest source of water for Anchorage. Are they crazy to deplete their water source??

If they want more fish; why not re-open the hatcher at Jim Creek, just below the power station is. Not every river has to have fish in it. Reopening the hatchery would provide more fish and easy access to all the area.

Couldn't they just construct a salmon run next to the dam for fish access to the lake. At this day in age of design and construction that should be a lot better time, money and effort instead of losing a water and electricity source.

Thank you,

Kirk Brown
Wasilla Resident

How will the 90% of the Muni water supply be replaced if the dam is removed? How many additional fish will be produced every year when more water goes into the river? looking at the study It appears additional water could add more turbidity and perhaps damage the spawning grounds thereby producing less fish. I don't think the negative impacts of removing the dam will be offset by any positives. I don't think removing the dam will increase the fish population sufficiently to justify the removal. The better option for more fish may to increase the capacity the hatchery. Can the stream handle more fish?

Come on it doesn't get any cleaner than Hydro-electric. My only question is how do we make more of the same around the state. The out flow has made for some great fishing opportunities. Provides access for all young and old alike including handicap or special needs people. What could possibly serve the community better. Please leave a good thing alone.

As a long term resident of Anchorage, I am proud of our commitment to clean energy- best represented by our Eklutna dam: both in the clean, non-polluting energy it produces, and in the fine drinking water it supplies. To remove it would be a travesty! 90 percent of our drinking water (!) and tremendous amounts of clean electrical power are the benefits of keeping this city's silent treasure. The village of Eklutna itself gets it's power from the Eklutna dam. And what would replace it? Burning still more hydrocarbons? This is a crazy scheme, and ought to be rejected as quickly and as forcefully as possible. Sincerely, T. Anderson, Anchorage AK

Anchorage needs the Eklutna power plant, dam, and reservoir. The power is clean with no emissions. The water doesn't require pumping out of the ground. Removing the dam would degrade the quality of life of Anchorage residents.

Sincerely,
Robert Ferebauer

Subject: Ekluna Dam
Date: Monday, February 5, 2024 6:29:06 PM

My name is Susan Hillman. I have been a member of Matanuska Electric Association for over 20 years. I firmly believe that taking out
the dam is not beneficial to this area of Alaska. The population of Anchorage and the Mat-Su Borough would be harmed if the dam were
destroyed. Anchorage would lose its water source, and our electric rates would rise because of the removal of the dam. Currently, the Eklutna
Dam is a base-load, scaleable, and carbon neutral carbon source. We must think of how much pollution will occur if the dam is destroyed.

I understand that the Eklutna Tribe, population of 70 members, wants to remove the dam in order to restore fish migration to the river.
The dam was constructed between 1927 and 1929, and its main purpose is to provide hydroelectric power to the city of Anchorage and the
Matanuska-Susitna Borough. To me, it seems unlikely that the fish migration will return after so many years. So, for the greater good, leaving the
dam in place would better serve the larger population of Anchorage and the Mat-Su Borough as a water and electric source.

Susan Hillman

We're 56+ residents of Anchorage for whatever that maybe worth. We're already paying extra for the wind provided electricity and with the highly advertised natural gas availability it clearly doesn't make "any" economic sense to eliminate the eklutna hydro electricity. As a water source eklutna very likely, with it's volume and elevation, should be less costly to develop, operate and maintain that and adequate number of water wells. It took should be kept. And, yes maintain and enhance fishing and recreational opportunities to but don't eliminate it.

From: Jeremy Hermann
To: Sam Owen
Subject: Comment on Eklutna Dam
Date: Saturday, February 10, 2024 10:33:20 PM

To Whom it May Concern:

My wife and I both agree that closing the dam and removing it to allow the original waterway to flow as it did prior to the dam being built is a ridiculous idea. I thought we were trying to get away from fossil fuels? What's the plan to replace the power currently generated by the dam?
In addition the provision of clean mountain water to the residents of Anchorage is a wonderful thing as is the beautiful lake and camping area/park that has been built around the lake. What's the plan to replace all that?
I have read about other case where dams that had been long established were removed and the resulting damage caused was way more catastrophic than anyone anticipated.
There is really no positives that I'm aware of? Unless I'm mistaken. Nature has already adapted as nature does and removing the dam now will cause far more destruction to the ecosystem that has adapted than it will benefit the ecosystem.
Now that's science!

Sincerely,

Jeremy and Manilyn Hermann

Subject: Comments in opposition to removal of Eklutna Dam
Date: Tuesday, February 13, 2024 8:19:45 AM

Published the following on Must Read Alaska (MRAK) a couple months ago when this first came up. Short form: Strong opposition to removal of the dam.

- Dam produces perhaps 5-6% of Rail Belt electricity. No reliable replacement for the lost generation is available, planned or funded.
- Dam removal will negatively impact water availability for ANC. We get 90%+ of our water from Eklutna Lake.
- Water level in Eklutna Lake is highly variable. No evidence it will support a constant flow downstream year round.
- No evidence of a stable historic population of reds ever existed in the lake. You are trying to restore a population that never existed.
- OTOH, water from Eklutna Lake DOES support 2 stocked runs of salmon at the tailrace (kings and silvers) that have actively supported sport fishermen for 30+ years.
- Removal of the dam will eliminate the possibility of using the Eklutna Lake system for pumped energy storage necessary to support large wind & solar being currently contemplated (Bob Seitz suggestion in MRAK).
- No small number of Eklutna tribe members want the dam removed so they can rebuild one on their land, which makes this little more than another tribal corporation money grab not unlike Fire Island wind.

This is a dumb idea. Don't do it. Cheers –

Alex Gimarc: Removing the Eklutna Dam

By SENIOR CONTRIBUTOR - December 29, 2023

By ALEX GIMARC

Must Read Alaska reported a few weeks ago that the Anchorage Assembly asked the legislature to approve removal of the Eklutna dam, ostensibly to rebuild a salmon run gone for at least a century.

This is the same Assembly majority that has managed to turn the homeless problem in town into a festering sore on the body politic. That festering sore has been financially lucrative for one of their members (Meg Zaletel) who they have determined not to have a conflict of interest.

With the decision to support removal of the Eklutna dam, the Assembly manages to get themselves into the energy business, and into the ever-contentious Cook Inlet fish wars while they pander to the 70 or so members of the Eklutna Tribe, something that apparently makes them feel good. The rest of us, not so much.

Their request is so well thought out that I am reminded of PJ O'Rourke's observation:

"Giving money and power to government is like giving whiskey and car keys to teenage boys."

With this recommendation, the Assembly majority has finished the whisky and is inserting the car keys into the ignition.

A deeper dive into the three issues revolving around the removal of the Eklutna dam is probably worth our time. From here, the issues include the following. There are likely more, but this is a start:

- *– Electrical generation*
- *– Anchorage water*
- *– How many fish?*

The Eklutna hydro station has been operating since 1955. It was sold to the three electric utilities, Chugach, MEA and ML&P in 1991. That sales agreement set a 30-year clock on returning the river to its natural state. Chugach and MEA published a draft of their Fish and Wildlife Program in Oct. The fourth utility involved is AWWU, as Anchorage gets 90% of its water from the same infrastructure used to generate electricity.

Eklutna hydro generates 40 – 47 MW of clean, reliable, carbon free electricity, just over 5% of all electricity generated in the Railbelt. The Eklutna dam raised water level in the lake some 24' from its natural level. That natural level changes throughout the year based on snowmelt. The intake is at the bottom of the lake, 60' below the current surface. AWWU's water comes off a tap to that piping system.

Advocates for removing the dam believe there is enough water available to support rebuilding the salmon runs, generating electricity and supplying water for Anchorage if the dam is removed. The immediate question is how will this water be allocated? Whose needs are most important? Our experience in the endangered species world is that the needs of the fish ALWAYS override those of the humans (delta smelt in California and snail darter in Tennessee).

Today, 90% of the flow is used for electrical generation. 10% of that flow is used for drinking water. Cut that flow in half, and output from Eklutna hydro will necessarily drop by a similar percentage. The intake was blocked for some weeks to months following the 1964 quake by an underwater landslide. It can be blocked again.

Additionally, there are two stocked salmon runs below the Eklutna hydro plant in its tailrace that need continual waterflow.

Perhaps the best analysis of Eklutna lake for the presence of salmon was a Sept 2017 paper by Loso, et al. They found no direct evidence in cores taken from the lake bottom for a red salmon population, though Eklutna tribal elders promised them they were a fishing village before the first dam was built in 1929.

Total population estimated entirely on Eklutna oral tradition is in the vicinity of 1,000 reds/year. It is up to the reader to determine how valuable those 1,000 fish/year are, especially since very few of them will be caught.

Note that salmon here in Upper Cook Inlet are gregarious. Silvers exploit flooding, spawning in places far outside their normal creeks and streams. All five species of salmon go up Rabbit Creek, as they also do in Campbell Creek. Very few salmon go up Eagle River. There is a small red run up a closed creek on Joint Base Elmendorf-Richardson.

If the Powers That Be make the decision to remove the dam, they will base that decision on all the "trust me" claims by the advocates like the Eklutna Tribe and Trout Unlimited that there will be no noticeable impact if the dam is removed. Of course, the advocates have no response other than trust me to questions about replacing lost electrical generation and what happens when the water levels are too low to support current water use during a dry year(s).

I would suggest the following questions be answered before any discussion of dam removal:

- How do you plan to provide drinking water for Anchorage in the event of low water levels in the lake? Who or what makes the allocation decisions? And who or what has priority?
- How do you plan on replacing 5% of Railbelt electrical generation with something that is at least as clean and reliable as hydro? That generation needs to be online before the dam is removed. Nobody has it budgeted.
- What impact of reduced water flow has on the two stocked run at the Eklutna tailrace? Do the needs of the new Eklutna fish outweigh those of the stocked fish in the tailrace and their user group? If so, why?

I always get worried when all the Usual Suspects demand immediate action to right an environmental wrong, especially when their response to all questions are “trust me.” I get more worried when the Rocket Scientists on the Anchorage Assembly are onboard.

We might get lucky. This might work out nicely. But the costs and pain level should it not will be substantial in terms of cratering electric reliability and drinking water availability. Are those costs and that risk worth the feel-goodism associated with removing yet another dam? Should be an interesting discussion.

Please do not give any consideration to the Anchorage Assembly's poorly thought out desire to remove clean hydroelectric power from your portfolio. I hike Thunderbird Falls trail every year and have yet to see any salmon there that would justify losing a strong, paid for piece of infrastructure that provides clean electricity for the area. Install a fish ladder if you must, but don't hurt the community by removing this resource, especially after the recent weather conditions we experienced.

Thank you,
Britton Goldberg

Dear CEA representative,

Please find my comments on the CEA Eklutna Hydro Valve Proposal below.

Thank you for considering my comments.

-Daniel Powers

_____

Anchorage residents should not consider removing the Eklutna Lake Dam until there is 1) dedicated redundant water supply infrastructure from Eklutna Lake to the Municipality of Anchorage and 2) its 40MW of electrical generation is replaced with alternative renewable power through public private partnerships.

I believe the Chugach Electric Association, the Municipality of Anchorage and State government cannot commit to tearing out a critical piece of infrastructure that supplies fresh water to the largest population center in Alaska without back-up plans in place.

Anchorage and Matanuska Susitna residents need clear answers on three questions before any demolition of the Eklutna Dam should be considered:

1. What would it cost to replace 40MW of hydro power with available renewable power?
2. How would replacing 40MW of hydro with wind or solar change the reliability of the power for the utility in terms of rolling reserve?
3. How can we justify eliminating existing reliable renewable energy considering our commitments to global emission reductions?

From: David Rutz
To: Sam Owen
Subject: Don't remove the Eklutna Dam!
Date: Wednesday, February 14, 2024 8:09:36 PM

I am strongly opposed to removing the Eklutna Hydroelectric Dam! We need it to help supply electricity and water! Removing it will have extremely negative impacts on our electric grid and it cannot be easily, reliably or affordably replaced.

I am a member of Matanuska Electric Assn.

February 14, 2024

I am absolutely opposed to removing the hydroelectric dam. Here are my reasons:

- Hydroelectric is a safe an sustainable energy source.
- The infrastructure is already in place. In order to replace a project like this would take YEARS of environmental study and cost millions upon millions in legal fees alone.
- We need every source of energy we can get in Alaska. We have extremely cold winters and the cost of electric and gas is not going down. Our processing plant in Fairbanks was shut and tore down years ago. We don't want to be in a position where our citizens are freezing to death because of a decision that was made by an email campaign from people who don't even live in this state.
- What are we doing to ensure our children will have viable energy sources here in Alaska
- Doing away with the hydroelectric plant does not make sense at all.

If you have any further questions, I can be reached at the above email or:

Subject: Draft Fish and Wildlife Program Comment
Date: Wednesday, February 14, 2024 7:24:24 PM

To whom it may concern,

I do not support the removal of the dam. The special interests involved in this project have one goal and that is to foist expensive, unreliable and environmentally destructive options on us all.

Brad Meiklejohn works for the Conservation Fund and is behind the dam removal. In his own words:

"A recent book with the title One Billion Americans is terrifying to contemplate. Everything I care about would be three times worse with three times more people than the 330 million currently here. I am waiting for the rejoinder book One Hundred Million Americans because I think we need to start rapidly downsizing. Humans are doing just fine but the rest of nature is not."

https://rewilding.org/we-lied-to-you/

The lead on the dam removal wants two thirds of the population eradicated. Let that sink in. These people wish us dead. They despise humanity. Who gets to decide who lives and who dies? This is horrible. Please do not let these people intentionally inflict harm on a huge percentage of the population.

This is not about fish. There are plenty of fish, available to EVERYONE at Tailrace, which is at risk. The critical supply of 90% of Anchorage's water will be lost. The critical and reliable power that we so need, especially when renewables fail and gas is short will be lost. The sunk cost of that invested into this critical infrastructure will be wasted. There will be extraordinary costs to upgrade the DOT/Railroad infrastructure when we least afford it.

Dam removal was never a part of the alternatives yet here we are. This was supposed to be a study. There is no end to what may be claimed to enact restoration projects of this sort (also happening in the lower 48) and for that reason I support a do nothing option.

Are there any rational adults in this conversation?

Please do the right thing.

Date: Wednesday, February 14, 2024 5:16:39 PM

Greetings,

As a retired Civil Engineer who previously worked on hydroelectric projects in Alaska including the Snettisham project that serves Juneau, I strongly encourage you to keep the Eklutna project.

Electricity from hydroelectric projects is some of the most cost effective and reliable electricity available. It is also very flexible in responding to peak demands which other forms of renewable energy are unable to do. The idea of replacing reliable Eklutna electricity with unreliable and much more expensive sources like solar or wind defies logic, especially when there is a push for renewable energy. I would encourage you to watch the Michael Moore documentary movie, Planet of the Humans available on YouTube, https://www.youtube.com/watch?v=Zk11vI-7czE which documents many of the problems with other forms of renewable energy.

The availability of our other reliable energy source, natural gas is becoming scarce due to limitations on future drilling and remains uncertain. Unless this trend is reversed, we may find ourselves with no reasonable alternatives to power Alaska's future.

As much as I like fish, removing the Eklutna Dam at this time, with no reliable replacement defies all logic; Therefore, I strongly encourage you to keep the Eklutna project intact.

From: Mark Hansen
To: Sam Owen
Subject: The Eklutna hydro project
Date: Wednesday, February 14, 2024 10:11:46 AM

Gentlemen,
Removal of the Eklutna dam makes no sense at all. This is by far the most cost effective power source contributing to the southcentral grid. Hydro projects typically have high capital cost but very low operating cost. The longer these projects operate, the more cost effective their continued operation becomes. It is absolute nonsense to decommission this paid-for hydro project now.
What will replace the lost power? People say natural gas, but there is a looming shortage of natural gas in the Cook Inlet area. The MEA generating station at Eklutna currently operates on natural gas, but is designed to use multiple fuels if necessary. Care to pay for running it on petroleum to replace the lost hydro power? How about a new coal-fired plant? All these alternatives will be more expensive and more polluting than hydro power.
The tailrace of the hydro plant provides more salmon than could ever be expected from Eklutna River. I understand that based on study of the sediments in Eklutna Lake, there is no evidence that salmon ever spawned in Eklutna Lake.
Keep the dam. Keep the hydro plant.

The Eklutna Lake Hydro Project has provided a great source of clean, dependable electricity for South Central and, is a water source for the Municipality of Anchorage. Leave well enough alone and don't disrupt the lives of hundreds of thousands of people for a few fish.

Subject: I am OPPOSED to dismantling the Eklutna Hydroelectric Dam!
Date: Friday, February 16, 2024 6:52:19 PM
Importance: High

I am very OPPOSED to any efforts to dismantle the Eklutna Hydroelectric Dam. Residents from Anchorage to the Mat-Su Valley depend on that dam for a reliable, affordable, and "green" source of energy and water. There is no reason to dismantle the dam that overrides the benefits of leaving it alone. The Anchorage Assembly should not be supporting the removal of something so vital to area residents!

I am a tax-payer in the Municipality of Anchorage and a member of the MEA Coop.

Subject:	Do NOT remove the Eklutna Dam
Date:	Friday, February 16, 2024 12:44:33 PM

Good afternoon. After reading through the information on the website, I urge you to NOT remove the Eklutna dam.

If the dam is removed:
I am concerned about the cost increase to my water and utility monthly bills.
I am concerned about the damage to the wildlife due to the new construction.
I am concerned about losing one of the best water recreational areas in the State of Alaska.
The benefit to the few is minimal vs the benefit to the greater with keeping the dam in place.

This dam provides a great renewal energy source. The cost for total replacement is too high. Utilize the existing infrastructure to provide the fish habitat in most of the river.

Thank you for the opportunity to comment.
Sincerely,
Lori Stender

re:comments on the Draft Fish and Wildlife Program

I am a resident of 99567 zip code and a member of Matanuska Electric. I am anti-dam removal. Eklutna's idea of replacing the hydro power with another renewable source will most certainly have its own negative environmental impacts somewhere else. So I do not support threatening our current water source and the non co2 emiting electic production with the hydro plant to attempt to restore fish habitat. Any gain in economic value of the restored fishery would likely be outweighed by higher ultility cost and therefore harms to all members of the Muni. My personal preference is for priotry to be given to efficient and economical power production, recreation, and a reliable water supply. Also please consider local resident's opinions over 'out of state' residents who are out of touch with local and state energy and ultility needs.

i have heard a lot of talk lately that there is a proposal to remove the eklutna dam and power generation station. this is the most idiotic thing i have ever heard. The dam provides 90 % of the drinking water and 10% of the electrical power for the municipality of anchorage. how is that going to be replaced and at what cost? what about the looming natural gas shortage that already threatens the electric grid?

From: John Lau
To: Sam Owen
Subject: Eklutna Generation
Date: Saturday, February 17, 2024 3:38:16 PM

I am from Alaska and an engineer involved in the energy industry for over 40 years. I believe it is unwise to remove the Eklutna power generation facilities. Although I do enjoy fishing, I do realize the benefit of having hydropower. It's already in place, truely renewable energy, and it is very cost effective contribution to keeping our power rates low. It would take 3 Fire Island wind farms to replace the annual capacity at a much higher costs.
Please do not remove this resource.

I am on the board of eaglexit a group that is endevoring to detach from the MOA and form a new borough in JBEr-Chugiak-Eagle River. It is our hope in the next few years to have ownership of the MOA interest in Eklutna hydro. I can not speak for the eaglexit board or all of the residents of the Assembly District 2 now. Howver, many people do not want to lose their hydro power or put the great water from eklutna lake in jeopardy. but more importantly they do not want to have to pay more for either of those services. we love the reliability and sustainability of eklutna hydro. we love our eklutna village residents and feel like they have put us in a tough situation by wanting to remove the dam. spending millions of dollars to remove the dam is just not reasonable. i am afraid that they see removing the dam as their only. They have had too many white ENVIRONMENTALISTS talk to them and paying them to turn eklutna river into a wild river. it is the flavor of the day by the environmentalist and NVE is being played. we saw the young white 20 year olds pushing their remove the dam fliers at the public meeting at the Eagle river event center. they were evangelizing the dam removal and sockeye return to eklutna lake. Hello people! eklutna lake is not kenai lake and never will be. please tell the governor to not accept the expensive options. keep our hydro power and our great lake. we cannot afford to lose them.

Subject: Eklutna Damn
Date: Sunday, February 18, 2024 8:56:16 PM

Hello,
Please leave the existing Eklutna damn alone. The is a valuable piece of infrastructure that does not need to be modified or degraded in any way.
It is fallacy to believe that removing the damn will bring fish back that do not even exist in waterways that do not have any obstructions.
Anchorage needs the water provided by the Eklutna damn and the Valley needs the power source.
I had the opportunity to visit the Eklutna plant and was most impressed by the efficiency of the entire facility. It is the most amazing and impressive facility that I have ever seen, and I believe it is a strategic necessity to maintain the damn.
To destroy or modify the damn would be tantamount to a crime against the people of south central Alaska.
Sincerely,
Lona Derner-Kinney

I am a Professional Electrical Engineer with 55 year experience in engineering, and over 80 years of living in Alaska. I have fished for sport, for subsistence and commercially for salmon. I consider the energy emergency to outweigh the fish emergency in the Eklutna River.

I consider that it is ill advised to remove the dam and reduce the power production from the Eklutna project so significantly at this time. Maybe after the Cook Inlet gas issued is worked out and some additional energy storage or other base energy source is added to the railbelt consideration of removing the dam would be less alarming,

Life and economy for most of Alaska is more important than a few fish at this time. I think the Eklutna river can be rehabilitated enough with the dam still in place to promote invigoration of at least some of the salmon species.

Robert Seitz, PE Electrical Engineer

To: Sam Owen
Subject: Opposition to Eklutna Dam Removal
Date: Sunday, February 18, 2024 1:37:25 PM

To Whom It May Concern,
I am writing to express my extreme opposition to the removal of the Eklutna dam. The claimed benefit of the “return of the salmon run” is idiotic, as any salmon that would have returned to spawn would have been hatched prior to the dam’s placement. (Please read up on salmon life cycles.)
I also oppose the acceptance of letters of support for the dam’s removal from parties outside of Alaska. Such “support” is being claimed by individuals whose lives would have no direct impact from reduced hydroelectric power generation and should have no voice in actions that put local residents’ electricity reliability at risk.
I am a 30+ year resident of the Thunderbird Heights community near Eklutna and member of Matanuska Electric Association Coop.
My expectation is that you resoundingly reject any proposed action to remove the Eklutna dam.

Sincerely,
Sara Penisten Turcic

THANK YOU FOR THE OPPORTUNITY TO MAKE A COMMENT. I NORMALLY BITE MY TONGUE, BUT CONSIDERING EVERYTHING HAPPENING AT ALL LEVELS, I AM HOPING TO HELP PREVENT US FROM MAKING A MISTAKE WE WILL REGRET.

AS A COUNTRY, THERE IS AN ATTACK ON FOSSIL FUELS, WHICH WILL ONLY MAKE IT THAT MUCH MORE DIFFICULT TO LIVE SAFELY, ESPECIALLY IN OUR ENVIRONMENT. ACROSS THE WORLD, TRILLIONS ARE BEING SPENT TO CHASE CLEAN ENERGY, WITH HYDRO BEING ONE OF THE BEST. WE HAVE THAT HERE, AND SHOULD BE LOOKING TO ADD MORE HYDROPOWER, NOT TO MOVE TO OTHER ENERGY SOURCES NOT AS RELIABLE. (MY MS WAS IN PHYSICS, WITH MY FAVORITE COURSES BEING IN NATURAL ENERGY.) EVEN IN A STATE THAT HAS MORE NG THAN IMAGINABLE, OUR GOVERNMENT RESTRICTIONS ALMOST HAD US RUNNING OUT OF FUEL THIS YEAR, AND WE CURRENTLY DON'T HAVE A GOOD SOLUTION GOING FORWARD FOR NG. WE ARE TALKING ABOUT REMOVING THE BEST SOURCE OF ENERGY WE COULD HAVE? WE NEED TO NOT ONLY KEEP THIS, BUT WE ALSO NEED TO LOOK FOR MORE HYDRO OPPORTUNITIES SUCH AS A LAKE TAP HYDRO PLANT SUCH AS THE ONE IN USE IN JUNEAU. THIS IS THE BEST AND SAFEST SOURCE OF ENERGY.

PROCESS FOLLOWED TO BUILD OUR HYDRO PLANT WERE IN PLACE TO PROTECT OUR ENVIRONMENT, TO CREATE THE LEDPA SOLUTION, AND I KNOW THEY WERE EXCRUCIATINGLY FOLLOWED.

SALMON ISSUES ARE AFFECTING ALL RIVERS IN OUR STATE, SOME GREATER THAN OTHERS. I FISH THROUGHOUT ALASKA AND FOLLOW COUNTS, AND BESIDES SHIP CREEK, EKLUTNA IS ONE OF THE BEST FISHERIES BY FAR, AND IT CONTINUES TO IMPROVE AS OTHERS STRUGGLE. COULD THIS POSSIBLY BE BECAUSE THE PLANT IS ON THAT RIVER AND THE WORK DONE TO ENSURE THE SALMON WERE NOT IMPACTED ACTUALLY DID MORE TO SUSTAIN THE RUN THAN HURT THE RUN? TWISTING DATA TO SHOW EKLUTNA BEING IMPACTED FROM THE HYDRO PLANT CAN BE EASILY DONE, SOMETIMES NOT EVEN REALIZING ONE HAS SKEWED DATA THAT YOUR HEART AND SOUL THINK IS CORRECT, BUT IN THIS CASE, EKLUTNA HAS FAIRED BETTER THAN MOST RIVERS.

I WAS BLESSED TO WORK AT THE CORPS OF ENGINEERS FOR 5 YEARS WITH SOME OF THE ABSOLUTE BEST AMERICANS DEDICATED TO FOLLOWING THE LAW. I UNDERSTAND THE DUE DILIGENCE THAT MUST BE FOLLOWED. EVEN WHEN IT IS FOLLOWED AS REQUIRED AND THE LEDPA IS CHOSEN, THERE ARE MULTIPLE CASES BROUGHT AGAINST THE DECISION FOLLOWED BY APPEALS RESULTING IN THE VERY, VERY LEAST ENVIRONMENTALLY DAMAGING PRACTICABLE ALTERNATIVE.

REMINDS ME OF OUR PIPELINE, WHERE ONE OF THE COMPLAINTS WAS THE IMPACT ON THE CARIBOU, BUT THE PIPELINE RESULTED IN A PLACE FOR THE CARIBOU TO GATHER FOR THE HEAT OR THE OCCASIONAL BACK SCRATCH NOT AVAILABLE ANYWHERE ELSE ON THE SLOPE. MANY SAY THE CARIBOU ACTUALLY SEEM TO CONGREGATE NEAR THE PIPELINE. ANOTH EXAMPLE IS THE MULTIPLE CASES BROUGHT AGAINST A CORPS DECISION TO ADD BREAKERS TO JUNEAU HARBOR AS A

TEMPORARY MEASURE TO PROTECT THE HARBOR. THERE WAS COMPLAINT AFTER COMPLAINT THE WILDLIFE WOULD SUFFER, AND ALL OF THEIR STUDIES SHOWED THIS. AFTER AN EXTENDED BATTLE WHILE THE HARBOR SUFFERED, THE CORPS WAS EVENTUALLY ALLOWED TO INSTALL THE FLOATING BARRIERS. RECENTLY THE PLANS WERE COMPLETED TO ADD THE PERMANENT BREAKWATERS AND REMOVE THE TEMPORARY BARRIERS, BUT NOW THE ENVIRONMENTALISTS DON'T WANT US TO REMOVE THE FLOATING BARRIERS AS THE WILDLIFE LOVES THEM…ACCORDING TO THEIR DATA.

I ASK WE NOT ONLY KEEP THE EKLUTNA HYDROPLANT, BUT WE ALSO LOOK FOR ADDITIONAL OPPORTUNITIES TO ADD MORE HYDRO POWER TO OUR SYSTEM.

BOBBY STONE

From: Bret Chambers
To: Sam Owen
Subject: Public Comment on Eklutna Dam removal
Date: Monday, February 19, 2024 10:18:24 PM

As an Alaska resident, living in Anchorage, my family does not support removing the Eklutna Dam for the following reasons.

1) Eklutna Lake is a critical source of fresh drinking water for Anchorage and surrounding areas (totaling 130 sq miles). The City of Anchorage owned Anchorage Water and Wastewater Utility supplies over 56,000 customers (~ one quarter of a million people). We have some of the best water sources in the world, because most of it is supplied by pristine watersheds high in the Chugach Mountains, surrounded by the protected lands of the Chugach State Park. With Anchorage as the largest city in Alaska, and a key hub for visitors and commerce, we should not be doing anything to risk our water supply.

2) The economics of this proposal to destroy the remaining Eklutna Dam to possibly restore 5 species of salmon is without merit.

First off, Eklutna is an Alaska Native village of approximately 70 residents within the Municipality of Anchorage (population > 280,000). Historically, since the initial Eklutna Dam was built in 1929 atop a natural landslide dam in the Eklutna valley, through today's dam, the ability for salmon to spawn upstream was changed. However, at the same time the need for a subsistence lifestyle was also fundamentally changed. With access to the Alaska Railroad, public roads and highways, air transportation, and the economic growth of Alaska, it is now possible to obtain food (and five species of salmon) from a number of nearby sources. A person who might have fished the Eklutna river for salmon before 1929 would be over 95 years old now. Times have changed.

For an economic analysis we need to look at the tangible and intangible benefits of the current dam. I won't attempt to quantity the cost per salmon brought back, but I'm sure it's not pretty. However, on the status quo side we have:

Eklutna Hydroelectric Power is the lowest cost renewable energy in Southcentral Alaska
40 megawatts hydroelectric power capacity, produced 177,438 kilowatt hrs in 2018 (supply for more than 24,600 residential homes).

What is the cost alternative if the greater Anchorage area fresh water supply is ruined. Will we become California, forced to use our toilets as a source of treated water for drinking. We're Alaskans and know enough to not eat yellow snow.

Bret Chambers
Anchorage Resident

From: Bruce Jaffa
To: Sam Owen
Subject: Continued Service of Eklutna Lake System
Date: Monday, February 19, 2024 11:10:25 AM

I support the continued use of the Eklutna Lake System to support the population of South Central Alaska. I am familiar with the entire system including the upper lake area, powerplant, and public water system. The Hydroelectric plant is a stable, cost effective, low impact source of power for Railbelt customers. The plant was built to high standards, is well maintained and operated. Similar to other Alaska hydroelectric plants including Bradley, Terror Lake, Swan Lake, Snettisham etc. the Eklutna plant is fully amortised and operating expenses are extremely low. Compared to other planned or imagined alternative energy, this plant has 24/7 dependability.
The mitigation of previous structures downstream of the dam has nearly completely restored the river to a wild and traditional condition. This is similar to restoration of other creeks and rivers throughout the State.
There is obviously an impact by any structure and Eklutna Lake impoundment, does change some fish habitat. The species that habitate the lower River can return while the lower grade Salmon that might have used the upper reaches will not. All civilizations make trade offs. Other impacts in this area include the Power lines, the Glen Highway, the AKRR and more. I am sensitive to the individuals or groups that are most directly affected but the mitigation offered appears reasonable, providing continued benefits to all users of electricity in the distribution area of the owner utilities. In this case the potential cure is worse than the problem.

I have briefly read a few articles on the future of the Eklutna dam. It makes no sense to me to tear down the dam. I believe the dam water provides a large amount of the water needed by Anchorage. The dam provides a very inexpensive source of electricity. The Eklutna native group could settle for some type of compromise. Perhaps a fish processing plant could be build at Eklutna village area using salmon available from a new or renewed river system.

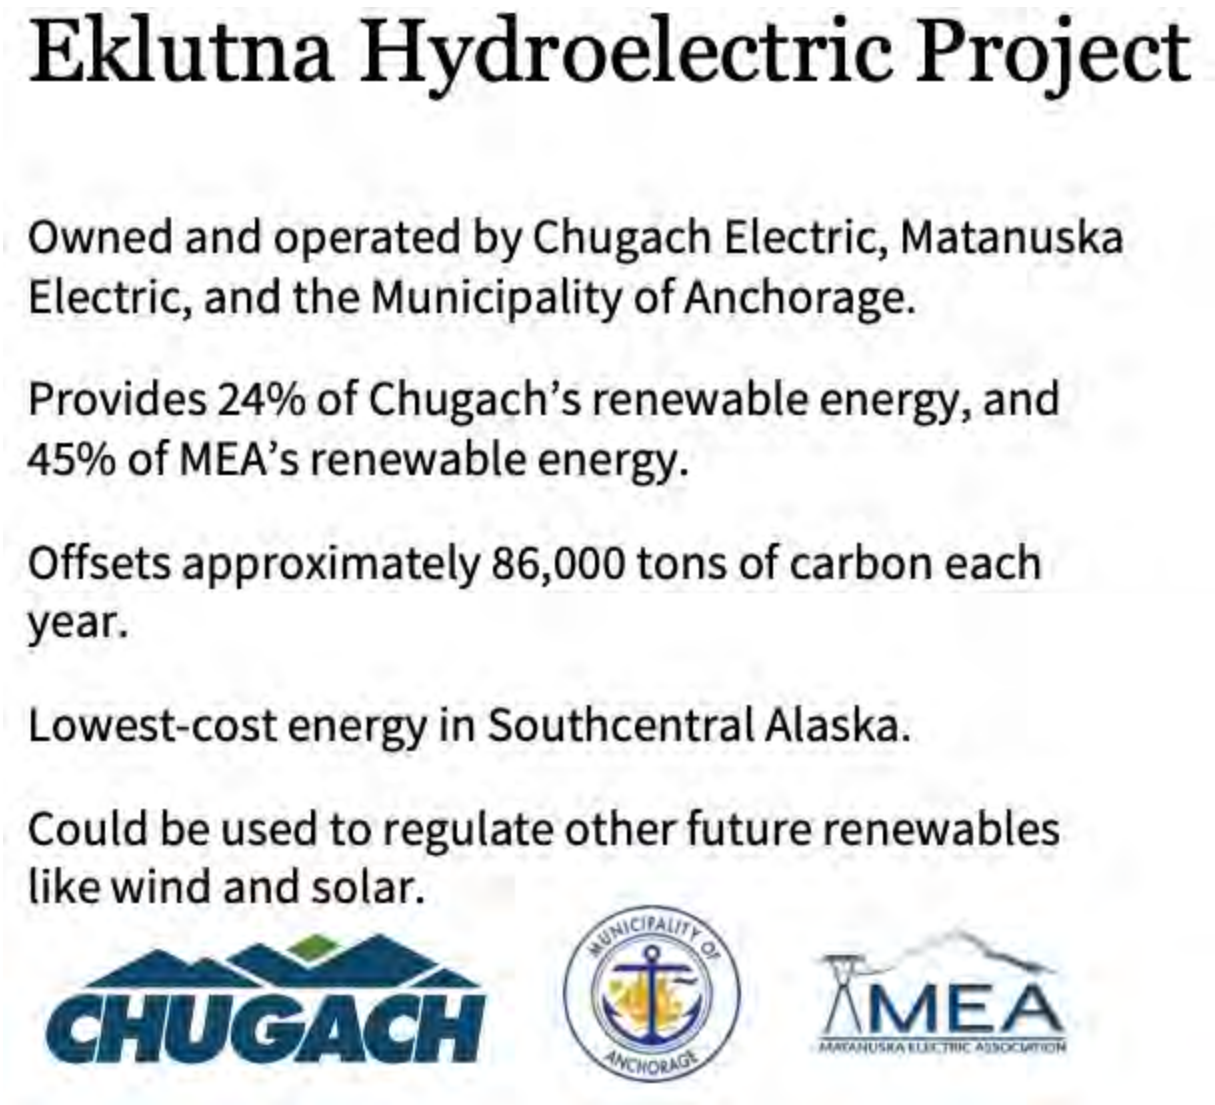
Hello,

I am against the removal of the Eklutna Dam.

Most of you claim to be very concerned about the environment and our carbon footprint and are pushing the Green New Deal and the Climate Change agenda. And yet you are planning to remove the Eklutna Dam, a source of power that is both clean, renewable, has no carbon footprint, and supplies almost 50MW of electricity in the rail belt as well as most of the drinking water for Anchorage and vicinity. Not only is it hypocritical to be pushing for renewable, clean energy and reduction of our carbon footprint and at the same time destroying clean, renewable, non-CO2-producing energy production. And by the way, solar panels get covered with snow (by now they would all be buried in the snow, not just covered) and wind turbines freeze, so neither one are reliable replacements.

Here are some facts from your own presentation.



Hydropower has been generating clean, renewable electricity for over 100 years, providing almost 7% of the US' electricity and 40% of renewable energy. It has enormous growth potential to power more homes, schools, and businesses. Hydropower plants can provide power to the grid immediately, serving as a flexible and reliable form of backup power during major electricity outages or disruptions. It also produces a number of benefits outside of electricity generation, such as flood control, irrigation support, and water supply.

Instead of spending an untold amount of money on the destruction of the dam and then on the building of other sources of electricity and drinking water yet to be determined, maybe your focus should be on spending the money on a way for the fish around the dam. Here is a place to start: *The NOAA Fisheries Hydropower Program works with partners including other federal agencies, industry, states, non-governmental organizations, and Tribes to identify and implement solutions to reopen rivers to migratory fish while preserving hydropower generation. With more than 1,000 hydropower dams licensed by*

the Federal Energy Regulatory Commission (FERC), NOAA Fisheries is busy keeping up with the demand to upgrade the nation's hydropower infrastructure to meet today's environmental standards.

The removal of the Eklutna Dam to restore fish to the full length of the Eklutna River in light of the current use of the lake for providing Anchorage with 90% of its drinking water and providing a source of cheap reliable electricity for the area with the hydroelectric project in light of declining natural gas reserves in the Inlet makes absolutely no sense. I hope the folks involved can see through the fog and leave the system as is without negatively impacting others.

I am totally opposed to the proposal to removed the Eklutna Dam. The dam is needed for water and electricity for Anchorage and is the most environmentally friendly option, is already there. Mitigation efforts should not require economic harm to Anchorage residents and removal of the dam.

To: Sam Owen
Subject: Eklutna Dam Removal Proposal
Date: Monday, February 19, 2024 3:05:50 PM

Good afternoon,

I'm writing as an life long Anchorage resident to strongly discourage the removal of the Eklutna dam.

I was born in Anchorage in 1993 at Providence hospital. I've spent every year since growing and thriving in Alaska. I love Anchorage. I love Alaska. But I hate the route we're going to take if we cut ourselves off at the knees.

But why bother this only generates six percent of the energy?

Every little bit helps. Alaskan's rely upon ourselves. We make it work. We do our best. We strive to make a living in one of the roughest places on earth.

We've already let outside sources halt further oil production. We have representatives of our state calling to ship oil and natural gas in to supply instead of opening new wells.

Why remove something that aids both Anchorage and the Matsu on the hope it could return salmon? That's just it. It's a hope. None of the published consultations prove this would be beneficial let alone believable.

Why make Alaska worse? Why make Anchorage worse? We're already dealing with an Assembly that won't work with others or in Anchorages best interests. Spiking crime, high cost of living, lack of residential housing, and low employment rates.

It's like they want people to leave. I love Alaska. But I've watched all but one of my college mates leave state for better opportunities. I have family leaving state because it's too expensive to live and retire here.

I hate to think this but in the back of my mind I wonder when I'll have to leave. I want to grow old here. I want my career to flourish and this state to be great again. I want that for future generations as well. But right now I don't see that happening.

And this is another drop in the bucket in Alaska's slow death.

Thank you for your time,

Riley Creed

I wanted to voice my concern of the idea of the removal of the Elkutna Dam. I 100% do NOT support this idea. It would be foolish to remove something that provides a relatively inexpensive form in renewable energy to our community. Please do not consider this an option.

Thank you,
Sharon Webster

Subject: Dam
Date: Monday, February 19, 2024 8:27:28 PM

Born here the Eklutna dam has been servicing Anchorage for the better part of my life. It has never interfered with anyone's homes in a negative way or impacted our lives. As a matter fact it's always beautiful to fly over and lake is beautiful to spend time at.
That water shed refills beautifully every single year and nature gave us the ability to utilize it for energy. We are not causing any harm to the environment with this damn and I'm not quite sure I understand the decisions of those who want to remove the damn. From my reading majority of those people who want to remove the dam are not even from Anchorage originally and do not understand how we developed as a town and a municipality. We cannot be supported by windmills, and energies are being limited from natural gas due to federal legislation, and this is one of the most beautiful, renewable resources….. naturally. we are not lacking for water in our municipality or our state.
I am not in support of the damn removal!

Date:	Monday, February 19, 2024 8:15:12 PM

Hello,
I am writing to express my opinion that there should be no change or removal of the Eklutna Hydro Dam! I find it hard to believe that it could even be considered to be taken out at this time. We have no shortage of rivers in Alaska that have salmon in them. We do have a shortage of hydro projects. With the push toward electric vehicles and appliances, the need for hydro power will only grow. We should be exploring how to get more hydro projects and increase capacity of the Eklutna project if possible.
Plus Anchorage depends on the water too!
Thanks,
Thomas Stuits

I am fully against the removal of the dam and the lost cost and clean power it generates. I can't understand what the people that think it is a good idea think who is going to pay for it. Also they don't understand the impact to your already high electricity rates. Removing hydropower generation electricity will greatly increase our electricity costs. The lower 48 are going to see the same power cost increases when they use all the water behind lake Powell and lake Mead on the Colorado River. They keep feeding water to the southern California desert cities (LA) and Phoenix valley with water they don't have and will eventually have to ration water constantly. It is funny that California can't even recharge all their electric cars in the summer with rolling brown outs do to their lack of power generation already and it's getting worse as they force more power plants to close.

Thank you,

Tom Robles

I'm curious as to who will be able to access and fish in the Eklutna River once salmon have been rstored- will this only benefit the Eklutna tribal members or will the general public be ABLE TO benefit from this project? It appears that Eklutna Inc. owns most of the affected access to this river in it's fishable area.

We do need to honor past agreements and accept the important responsibility of not just keeping our waterways protected but rehabilitating a natural part of our environment. At a time when humans have had such a large negative impact in Alaska, benefiting from complying with the law in that way would be honorable and responsible. Although the Municipality "owns" the land, such ownership includes stewardship, respect, and obligation.

As an Alaskan taxpayer, I offer the following input regarding the Eklutna hydroelectric project dam.

I believe first and foremost, the damn needs to be upgraded with the local native community and salmon fishery in mind. I say this, because I believe these two things were completely ignored at the time the dam was built. Correcting these are the right
thing to do.
With that said, water quality and resource should be maintained, but not be the priority.
Financially, the Anchorage municipality could burden the taxpayers as little as possible. One dollar a year for $400,000 home is more like $.20 for most people.
Thank you for allowing input,
sincerely,

CAUTION: This email was received from an external source

To reach the lofty goal of replacing electricity produced by burning fossil fuels with an increased percentage of electrcity produced with renewable resources, you need to allow renewable projects to be constructed and go into opertion. Reliability and economic sense is paramount For renewable energy projects to be successful. Hydro projects such as Eklutna have a long world-wide record of both reliability and economic operation. If fish mitigation efforts, which have a record of success, are not adopted and this becomes the reason to prevent hydro energy projects from being constructed, the whole push for increased renewable energy is a sham and is doomed to failure.

Date: Friday, January 19, 2024 3:50:00 PM

Hi Kurt,

Thank you for your comments. They have been added to the record and will be taken into consideration by the Project Owners.

To answer your questions...

1. If thats is the case will the Glenn HIWAY NEED to be reconfigured to allow for flood mitigation, and at what cost? A natural flow regime in the Eklutna River could significantly impact the downstream highway bridges. These impacts are currently being evaluated as part of a more detailed assessment of dam removal.
2. Anchorages new water source? A natural flow regime in the Eklutna River would likely have significant impacts on AWWU's buried pipeline as it exists today. We are coordinating closely with AWWU to further evaluate these potential impacts and determine what actions would need to be taken to protect the public water supply under this scenario (e.g., relocating the pipeline, finding a new public water supply, etc.)
3. Is additional power avaialable to allow for the closing of the hydro plant? what is the anticipated cost increase? If Eklutna hydro was replaced with natural gas, the present worth would equal approximately $300M over 35-years. The cost of replacing Eklutna hydro with another firm renewable energy source, such as another storage hydro project, is currently unknown and not budgeted.
4. this is the only location providing the mobility impared salmon fishing opportunities in south central and that could be reduced to levels not worth participating, it's already on a steady decline from just 5 or 6 years ago. Thank you for your comment.
5. How could salmon posibly make their way up such a rapid elevation change to the lake? Our models show that salmon should be able to make it up the wetted area of the Eklutna River with the proposed flow regime.

Hope that helps and thank you again.

RE: Eklutna tailrace

Hello Chugach Electric!

i was unable to attend the public meetings however I wanted to provide comment on the tailrace, I'M very familiar with the tailrace from a sportsmans perspective, I have fished there for well over 20 years. My understanding from trout unlimited press release is that they want the power plant shutdown and the dam removed to allow for fish passage to the lake.
1. If thats is the case will the Glenn HIWAY NEED to be reconfigured to allow for flood mitigation, and at what cost?
2. Anchorages new water source?
3. Is additional power avaialable to allow for the closing of the hydro plant? what is the anticipated cost increase?
4. this is the only location providing the mobility impared salmon fishing opportunities in south central and that could be reduced to levels not worth participating, it's already on a steady decline from just 5 or 6 years ago.
5. How could salmon posibly make their way up such a rapid elevation change to the lake?

This is an observation I have seen repeatedly while fishing the upstream area of the tailrace, when salmon are in the tailrace (from june on) and the turbines speed is reduced to low levels the salmon are able to make their way to the turbine impellers are crushed and or decapitated. I have watched many fresh salmon tumble out from under the concreate spalshing on the surface with their heads crushed. I fished at the turbine outlet when the plant was not GENERATING SEVERAL years ago and the bottom was littered with fresh king salmon heads and carcasses, all the heads were pinched off, every cast i reeled in one or the other time and time again until i had enough. with the turbid water in the summer people are totally unaware of this happening. fish screens would be a great idea if the plan is to reduce the power generation (flows). A side effect of the reduced flows during the summer is that the knick river builds up a sand bar accross the mouth of the tailrace and this noticeably reduces the number of salmon in the tailrace.
I host many people fishing every year, they love the tailrace and they can't wait go back even though I take them all over the valley fishing, people love the tailrace!

I have performed the annual fire inspections for the eklutna power plant several times, it is a very interesting site and worthy of tours!

thank you for your time, Kurt lehman

Hello,

Thank you for your comment. Just to clarify, the Project Owners executed a term sheet with AWWU that would allow them to execute the AWWU portal valve option if (and only if) it's included in the Final Fish and Wildlife Program that will be issued by the Governor in October.

Please feel free to reach out if you have any follow-up questions on the project.

I attended the recent public meeting at the Spenard Rec center concerning the impact of the dam on the eklutna river, and have two observations. if i understood correctly, the plan for the eklutna river salmon stocks was based on trying to keep salmon stocks to current levels, which I understand to be severely depleted. if that is the case, it seems like the responsibility to be a good steward of public resources is not being met. My other observation is that the idea of getting at least some relief to the watershed by adopting a long-term public water conservation education plan to help mitigate the pressure on this resource was conspicuously absent. I've been a resident of alaska since the 60s and do not recall ever hearing about something like that. I realize it would take time to see any real effect from a WATER conservation plan, but i think most people in the area are unawARE OF PROBLEM THERE. i hope these comments will be seriously considered.

Dear Owners of The Eklutna Hydroelectric Project,

Chugach Electric & Owners of The Eklutna Hydroelectric Project;

Re: Eklutna Creek Restoration

Having witnessed Eklutna Lake rise and fall significantly over the sixty years+ of my residency in Anchorage, I appreciate that the electric output of that hydroelectric system has been important. It represents the least expensive electric source currently available, however the effort to maximize output has resulted in the sacrifice of a once vital fishery and the complex web of the Eklutna Lake's once healthy ecosystem.

Power can continue to be extracted even with surface out flow, enough to permit spawning salmon to return to Eklutna Lake. With investments in wind & solar power plus high head (drilling can be done with great accuracy these days) other small but reliable sources could add to the generation infrastructure portfolio. In short, Eklutna electricity does not need to be maximized but, instead can supply more in line with the natural varying rates of run-off into the lake. Keeping that lake full has too many benefits to ignore!

Sincerely; Thomas R. Wilson, 1834 Sunrise Drive, Anchorage, Alaska 99508, (907) 279-9868 skycabinairships@aol.com

Subject: Can there be a win-win solution?
Date: Sunday, January 28, 2024 9:53:01 PM

Reading the letters taking sides either for hydro and the best drinking water in Anchorage vs the salmon reaching the lake like all other world class lakes in Alaska, I wonder why people argue for only one or the other? Could the Utility option to restore a majority of the river now be a win, followed by an agreement to get salmon the rest of the way in 10+ years, perhaps without specifying the means being dam removal? Are there other ways that could benefit all sides - such as fish ladders like at Ship Creek where they fill up with salmon moving upstream? I wonder if we can find a different way to preserve the lake for drinking waste and energy - critical - and restore salmon to their spawining habitat and cultural significance at the lake - by other means than dam removal? That seems like a promise all sides can keep.

To: Sam Owen
Subject: Public Comment
Date: Tuesday, January 30, 2024 3:08:14 PM

To all concerned,

My comments are centered around the benefits of, and potential detriments to all communities in the South Central of Alaska that are affected by the power provided by the Eklutna Hydro Electric Dam.

Benefits include, but not limited to:

Employment provided by the Utilities involved
Reliable electricity to said areas
Fish Hatchery that provide for the reproduction of those species
Food the fish spawned on the waterways involved provide to people and animals fishing those waterways
Camping and recreational area for viewing wildlife, hiking, photography, swimming, and boating
Housing and jobs for the Eklutna tribe
Employment for Spenard Builders Supply and their employees

Potential detriments include, but not limited to:

Loss of all of the above mentioned benefits

Thank you for this avenue for communicating my concerns

From: ken everson
To: Sam Owen
Subject: Eklutna salmon restoration
Date: Wednesday, January 31, 2024 7:35:28 PM

I do not want to see a new dam built at Eklutna Lake. I want the current dam removed and the beautiful lake allowed to rejuvenate the Eklutna River and the natural population of salmon.

I am offering another way to look at this project. Reiterating information that has already been established is not my intention. Scientists, conservationists, economists, environmentalists, CEO's and politicians have all weighed in on their view of what the future should hold for the Eklutna River. Some have opinions or suggestions that can be well supported, and others don't.

There is so much information out there (thanks to expensive research) that we lose sight of the first-born objective---SAVE THE SALMON! The most immediate way this can be done is to restore the river from its start at Eklutna Lake to its termination in the Knik Arm. Building a dam is not going to put more water into the lake, it can only manage what flows out.

Our state's early visionaries did an amazing job of setting the stage for massive oil production, mining and development. Each Alaskan should appreciate that foresight but should not ignore the downside of the progress that has been made. The destruction of habitat of nature's residents is a primary example. Another aspect is the willingness by powerful people and companies to intentionally not honor promises and contracts previously agreed upon. These actions would certainly make our early visionaries' frown and possibly even cry.

Do not build a dam that may not be needed by the end of a single decade. Build a river that can exist for centuries.

Respectfully,
Ken Everson

Subject:	Eklutna geohazards need more study
Date:	Sunday, February 4, 2024 1:49:44 PM

Hello,

I'd like to comment on proposed measures to improve salmon habitat and alter hydropower generation at Eklutna Lake. This comment does not support or oppose any specific proposal, but instead raises a concern that may be critical to consider, regardless of the option under consideration.

I am a geologist who studies natural disasters, especially landslides and tsunamis. About a year ago a colleague pointed out evidence that there are large sections of the mountains above Eklutna Lake that have slowly deformed in the past. This past deformation raises concerns about the possibility that one of these slopes could suddenly collapse in the future, generating a tsunami in the lake.

This concern has led a number of geologists including myself to make some initial steps to study the potential hazard. We have been working in coordination with Carrie Brophil and Marc Lamoreaux at Eklutna Village Tribe. This work is unfunded and we have only the most preliminary results to report.

I put details below, but in short my recommendation is that any proposed development be informed by study of the potential for large (> 1 million cubic meter) deep-seated landslides from the mountains around Eklutna Lake, with the potential to create tsunamis in the lake.

First - what we do know:

The evidence of past slope deformation is extremely strong - it is almost certain that this has happened in the past. The evidence we are focusing on is for "deep-seated" landslides, which are much thicker than common landslides involving just soil. They can extend hundreds of feet into the bedrock.

We also know that similar slopes in the area have failed suddenly ("catastrophically") in the past few thousand years. In particular, there is clear evidence of a landslide that crossed upper Eklutna River and formed a dam, which eventually eroded through. There's also evidence of a large landslide that swept across upper Eagle River Valley. However, we also know that there probably have been no large landslides from the mountains into Eklutna Lake since glaciers retreated, based on surveys studying smaller landslides that happened on deltas in Eklutna Lake.

In preliminary surveys of one of the unstable slopes above Eklutna Lake, we found evidence that it has moved recently, though that evidence was quite localized - not on the scale of the full instability, which appears to be approximately 100 million cubic meters.

We have reason to believe that these mountains have permafrost in them. There are areas where "rock glaciers" occur, such as upper Thunderbird. Rock glaciers are commonly associated with permafrost. This is potentially significant because there are areas in Alaska, Iceland, and Greenland where permafrost is getting weaker as it warms up, and this is leading

to more and larger landslides.

It is also common that when we study recent catastrophic landslides, there are signs of slow creeping deformation that happened before the catastrophic landslide. This creeping deformation is what we see at Eklutna. However, it's important to remember that there are many cases where slow deformation never leads to catastrophic failures.

Finally, where we see landslides of similar size on similar slopes fall into water, they produce very destructive tsunamis that can reach hundreds of feet up shorelines. Events like this have happened in Alaska at least 5 times in the past century. Such a tsunami in Eklutna Lake could destroy existing infrastructure or future development. If a tsunami like this resulted in failure of the dam allowing more water to escape from the lake, this could increase downstream impacts.

Second, what we don't know:

Unfortunately, sites like this, where deep-seated landslides are occurring in permafrost, are very poorly understood. There is currently no generally recognized technique for estimating the probability of failure - a crucial variable with any rational assessment of cost and benefit of development at Eklutna.

We also know little about the current status of the slope. In summer of 2023 we installed a number of temperature loggers that may help us estimate the extent of permafrost. This might be the basis for future work to estimate how this permafrost is changing and what might happen in the future.

However we have no instrumentation on site to detect deformation, if it is happening. By using instruments like GPS and tilt meters to measure deformation it might be possible to see signs of acceleration that can precede catastrophic failure.

Also, while we can say in general that a catastrophic failure could create a dangerous tsunami, no modeling has yet been completed to see how extensive the impacts of such an event might be.

In short, there is a lot that could be done to better understand the slope, but this work has barely begun.

Finally - recommendations:

I believe that in cases like this where there is strong evidence of a possible hazard, it is important to accurately characterize that hazard before making costly investment in new infrastructure.

It is also important to look at the potential for added risk when the lake-level is elevated for hydropower energy storage. If this elevated risk is substantial, this might favor development that minimized elevating the lake level.

Thank you for your attention, and please feel free to reach out to me if there is more detail I can provide, or if you wish to coordinate on research.

I purchased the only piece of property I could afford, got my electric pole installed and I paid mea for this. if you remove my ELECTRICITY, i will not be able to survive. I am just trying to survive. hope a class action lawsiut will help the people. with no people being able to live in alaska it might as well be returned to russia, they would be better than what is happening now.

Subject: Dam Removal

The Land Claim Settlement Act was reparations for all past ills put upon Alaska Natives. Or so I was told when I was at Clark Junior High in the 1970's. There were to be no further claims. This settlement gave Native groups funds and land resources to take care of their people and to use said land for purposes of revenue generation to take care of their people in trying times.

All fish in the upper cook inlet have diminished since the 1960's. How will fish for the Eklutna river be able to survive any better than all of the current declining runs.

When there is currently limited afordable housing in the greater Anchorage Mat-su area why do we want to make water and power even more expensive thus making housing more expensive for more people.

Teresa Churchel

Subject:	A better alternative for Eklutna Hydro
Date:	Monday, February 12, 2024 5:13:43 PM

Greetings,
I am Chris Nyman, a lifelong Chugach and MLP customer.
I have recently stuck my nose into the Eklutna Fish and Wildlife mitigation project.
When I read that various parties were asking for the dam to be removed I was astonished.
That got my curiosity going so I dug into this a little bit. I am a retired civil engineer .
I don't think many people realize that removing the dam is about the same as removing the entire Eklutna Hydropower Project.
It seems antithetical that one would contemplate removing the most economical and "greenest" energy source we have.
I realize also that there has been an environmental price to pay and so the notion of restoring a minimum flow to the riverbed is laudable.
Therefore I believe that the proposed mitigation should concentrate on releasing water from the dam at the most practical times.
A perfect solution will not be found due to the continued operation of Eklutna Lake as a clean energy reservoir.
This operation seasonally lowers the lake level 25' below the spillway drain which makes the idea of supplementing the river flow difficult to accomplish.

Attached is a concept I developed in an attempt to maximize the improvement to base flow without sacrificing the capacity and operation of the Hydropower project.
Also attached is a recent 1 year look at the water level in Eklutna Lake and how it relates to the dam. Notably the lake level is high enough in mid-July through December to continually drain water through the spillway drain. My proposal, if feasible would supplement the upper reach river flow through drainage improvements when lake levels are too low.

Its a lot to present on a couple sheets of hand scratches but I think it is a good compromise that achieves some of the restoration goals of those that are calling for the abandonment of the Eklutna Hydropower Project. AND still maintaining the efficient energy supply we enjoy from our "greenest" energy source.

Truly yours....Chris Nyman

Subject:	Comments on Draft Fish and Wildlife Program, Eklutna Hydro Project
Date:	Monday, February 12, 2024 12:09:33 PM

I'm submitting the following comments after reviewing the materials on the project website and attending the Anchorage public meeting in January 2024. After the meeting presentation, I spoke with several of the subject matter experts to gauge whether my concerns, outlined below, are well grounded.

My Background: I worked for the Anchorage Water and Wastewater Utility (AWWU) for 30 years. I was the Water Quality Supervisor for most of that time and as such was responsible for monitoring drinking water to ensure that it met federal and state standards. I held a Water Treatment Operator certification during my time at AWWU and am knowledgeable about source water protection and treatment plant operations. I recently served seven years on the Chugach State Park Citizen Advisory Board. I do not represent either organization, but the knowledge gained from working there informs my comments.

I support the proposed plan to introduce water via the AWWU portal one mile downstream from the lake. It makes the most financial sense; it should create a flourishing fishery in the river, and it meets the intent of the 1991 agreement.

However, the reason I wish to comment is not to list the many other reasons why this option is best. It is instead to argue strongly against any option intended to introduce a flourishing fishery into Eklutna Lake by removing or modifying the dam. I have two areas of concern – negative impacts to the drinking water supply and increased adverse human/bear interactions.

Human/bear interactions:
Salmon attract bears. There is a campground next to the lake and a well-used trail adjacent to the lake along its entire length. A flourishing fishery in the lake will attract more people and bears to the lake. This will most certainly cause more bear/human interactions with increased possibility of injury or death to both.

Water Quality Impacts:
Eklutna Lake provides about 90% of AWWU's raw water supply. There isn't any other combination of AWWU's other sources that could replace this source. The first of five primary reasons for the creation of Chugach State Park, as listed in Alaska Statutes (AS 41.21.120-41.21.125), is "*To protect and supply a satisfactory water supply for the use of the people*".

There is a possibility of negative impacts to water quality through the addition of organic compounds to the water from live and rotting fish. The process at the Eklutna Treatment Plant

is designed to remove inorganics, primarily glacial silt. It isn't designed to remove organic compounds that can combine with chlorine to cause taste and odor issues. It's difficult to gauge whether this is a legitimate concern because no one was able to give me a firm estimate of what the increased biomass to the lake might be from the introduction of a fishery. **But no robust study by a team of professionals (that should include fishery experts, water quality chemists and water treatment engineers) has been done to determine if measurable negative impacts are possible.** AWWU was represented at the meetings that led to the proposed option. But it seems, from review of the project documents and talking to the public meeting subject experts, that only the most cursory consideration of water quality impacts has been done to date and that AWWU has been more focused on impacts to infrastructure.

Even if a valid study shows that the increased biomass shouldn't cause a problem, good management practices for raw water reservoirs (which Eklutna Lake is) would carefully manage public access rather than purposively create additional recreational opportunities that will attract significantly more people to the lakeshore and into the water.

Thanks for the opportunity to comment.

Subject: Eklutna Dam Removal Proposal
Date: Tuesday, February 13, 2024 11:23:29 AM

What is often poorly understood about green energy, primarily wind and solar, is how utilities must deal with the intermittent nature of these sources. The grid must always have enough power available for peak demand, and if there is a green energy supply shortfall then “rolling reserves” must be available almost instantly, with sufficient capacity to make up the shortfall, or the grid will go down. Depending on the extent of a power outage, it can take hours to get the grid back up and power restored to all customers. It is difficult to find a better source of instant power than hydroelectric. If those who are pushing for using green energy sources are serious, and are concerned about reliability and costs, they need to think about what is available to provide these rolling reserves. Other possible alternatives are batteries or operating fossil power plants connected to the grid, which are inefficient at low loads when on standby waiting for a green energy shortage. Large fossil power plants can’t be started instantly, and even combustion turbines can take several minutes or more to come up to speed and go on-line to deal with shortfalls.

Thank you,

William Johnson

Subject: Eklutina dam
Date: Thursday, February 15, 2024 2:10:50 PM

Hi. Allen McLeod here. Why is the eklutina dam scheduled to be removed? Or is this just a rumor? Doesn't it provide "clean" energy? Isn't it disingenuous to take out a source of renewable energy while encouraging more use of electricity to "save" the planet? And I believe I read recently that cook inlet gas reserves were waning. Encouraged to turn my thermostat down. What kind of alternative universe could this be where things that make no sense are not only considered but brought to fruition? Surely I'm not supposed to take these ideas seriously. Please. Explain. Maybe I've been misinformed. Thanks

Subject: Surface Water gate to bypass Eklutna dam
Date: Friday, February 16, 2024 1:36:58 PM

It makes more sense to me to bypass the dam with a surface water gate that would feed ether a fish ladder or a bypass stream that would connect to the river bed downstream of the dam.
The surface water gate could be built in sections so surface water could be released at different levels as lake levels change. CHARLIE PETER

This agreement seems so antiquated ... eklutna, Inc., even now is looking at a massive housing development that could be curtailed by removing the dam. Can't some trade be made if necessary to increase fish by stocking the Lake to provide fishing experiences for traditional lake fishing?

Of all of the ongoing discussion on this issue one item has been left undisclosed to the Taxpayers and Ratepayers of the Municipality of Anchorage by all parties involved. This concerns how those arguing for the removal of the Eklutna Dam have not informed the AWWU Ratepayers that the Anchorage Assembly will replace the Regulatory Commission of Alaska in the setting of their rates charged.

This fact has been published in an article dated January 31st in the Alaska Landmine and also January 19th in Must Read Alaska authored by myself of which I now also submit as part of these comments.

During the sale of ML&P to Chugach Electric I testified to the RCA concerning how this aspect of the sale was not being disclosed to the voters by both the MOA and CEA. The RCA addressed this issue on Page 70 – (lines 14-19) - in Order Number 39 of Docket Number U-19-020 which approved the sale of ML&P to CEA in which the RCA stated …

"Based on the finding that MHP – (Municipal Hydro Power) – will be competing with other electric operating entities and public utilities under the MEA PPA, we also find that MHP is fully regulated under AS 42.05 pursuant to the AS 42.05.711(b)(2) exception to the exemption from regulation granted by AS 42.05.711(b). With this finding, and contrary to the expectation of the MOA, Anchorage Water and Wastewater Utility will remain subject to regulation under AS 42.05 pursuant to AS 42.50.711(b)(2)."

As none of the parties now in this current issue have disclosed this aspect as part of their fiducial responsibilities the question I asked of the RCA in my testimony concerning the sale of ML&P repeats itself.

What else is involved in this issue that Chugach Electric, the Municipality of Anchorage, the Anchorage Assembly and Matanuska Electric Association are not telling us about.

Thank you for taking the time to review these comments.

Subject: Grievous expansion
Date: Monday, February 19, 2024 9:41:14 PM

The only comment I have is for all parties involved to abide by the 1991 agreement at its minimum requirement.

The agreement stated to do a study and low or no cost mitigation.

The agreement did not state to include any and all input. “Stakeholders” were never mentioned in the agreement. The only parties privy to input are clearly stated.

The agreement did nor state that radical outside environmental NGOs and non profits should be allowed a consideration whatsoever. The agreement did not say the dam should be removed.

The agreement did not state that an alternative should be formulated, particularly nor a $57M project specifically tailored as a foundation towards an $800-900M pumped storage unit to further the inflation causing, grid destroying, corrupt renewable portfolio standard.

Review the agreement and abide by it in least cost fashion. We have no funds for any other path forward.

Subject: Eklutna missed option
Date: Monday, February 19, 2024 1:51:59 PM

I don't believe that all the potential options were properly examined.

In particular, the Eklutna PSH proposal would meet ALL the objectives sought. It would restore the lake to it's natural level, permit the complete removal of the existing dam without risk of flooding, and restore year round water to Eklutna River with a natural flow from the mouth of the lake.

Secondly, it in combination with the Little Susitna Mtn wind farm would actually lower and stabilize the cost of electricity for CEA and MEA customers. Keeping electric rates from going up - though not one of the objectives of the Eklutna rehabilitation - is a fundamental duty of our utilities. It's wrong to think that "there is no room to reexamine the option or other alternatives regardless of the impacts to rate and taxpayers". It would be totally a neglect of duty (and possibly illegal) to disregard the cost of this decision.

Hydropower is both cheaper and more reliable than natural gas, especially here. Remember that it was a natural gas failure that drove our recent cold weather near catastrophe.

Respectfully,
Kerry Williams

Subject:	Comment on the Eklutna River Draft Fish and Wildlife Program
Date:	Monday, February 19, 2024 2:09:30 PM

Dear Owners of The Eklutna Hydroelectric Project,

The public does need more time to learn about, understand, and comment on this process. We have been urged to jump on one side of the issue, but this issue seems to be very complex and warrants a thorough understanding of the impacts of both removing the dam, and NOT removing the dam.

My questions include:

-- If the dam is removed, where will Anchorage get its drinking water?
-- If the dam is removed, will ground water supplies be tapped to supply Anchorage with water, and if so, what impacts could this have?
-- If the dam is removed, how will flow be restored in a way that permits fish passage? My understanding is that currently the obstacle is not so much the dam, but the current removal of the water.
-- If the dam is removed, will there be other environmentally taxing water development projects proposed as a trade-off?

-- If the dam is not removed, is further degradation of the watershed forecasted?
--If the dam is not removed, does this further impact the village of Eklutna?
-- Is there another method to compensate the village and people of Eklutna for their lost fishing grounds?

Thank you!

Sincerely,
Lilly Goodman-Allwright

Hello -
This dam was well considered before it was built and has been doing well since then.

Appendix C. Form Letters

This page intentionally left blank.

Trout Unlimited Form Letter – Version 1

To the operators of the Eklutna Hydroelectric Project,

The draft Fish and Wildlife Plan you proposed for the Eklutna River does not meet the needs of salmon, the vision of the Eklutna Peoples, or your legal obligation to mitigate the project's impact to fish and wildlife. Leaving a mile of the river dry, releasing only 3% of historic flows, and not providing fish passage into the lake and upstream habitat will not restore the river's salmon runs and are unacceptable.

Instead of wasting ratepayer and taxpayer money on a mitigation plan that won't fully revive salmon runs, **I ask you to remove the Eklutna Dam to fully reconnect the river and return the water flows needed to support the river's fisheries.**

I understand the reliance on this hydroelectric energy source in the near-term, and the proposal to remove the Eklutna Lake dam within the next decade, when replacement renewable energy is expected to be available, is reasonable. I also appreciate that community partners are willing to pitch in to help offset costs of the dam removal – taking advantage of this opportunity seems like a fiscally smart decision.

The Native Village of Eklutna has clearly communicated their vision for thriving wild salmon in the Eklutna River, including Eklutna Lake and headwater tributaries. Your ratepayers and many Alaskans support this vision.

The Eklutna Hydroelectric Project deprives the Eklutna River of water and blocks salmon from migrating in and out of Eklutna Lake. Salmon populations will not recover without a reliable and consistent supply of water and access to important up-stream spawning and rearing areas. This is particularly true for sockeye salmon, if they cannot access Eklutna Lake and its tributaries. CEA, MEA and MOA cannot meet their mitigation obligations within their budget constraints with anything less than removing the dam.

Now is your one chance to make this right. **Now is your chance to invest in a river that Alaskans can be proud of and help show the world that Anchorage does not just love our salmon, we know what it takes to care for them and actively work to bring them back.**

Trout Unlimited Form Letter – Version 2

Eklutna Power Companies & Alaska Governor,

As ratepayers, we believe affordable electricity and abundant drinking water are possible alongside healthy wild salmon runs in the Eklutna River. Removing the Lower Eklutna Dam in the summers of 2017-18 was the first step in restoring the Eklutna River. The second step is to restore streamflow and provide access for salmon to their historic spawning and rearing areas so wild salmon populations can flourish once again.

Eklutna River salmon have been strained by inadequate water flows and blocked migration for nearly a century. As ratepayers and residents of the area, we encourage you to move quickly to restore this important river.

We recognize and appreciate the efforts the utilities have taken to study the impacts of the Eklutna Project. We hope you recognize the unique opportunity for the Eklutna River and encourage you to develop and implement a comprehensive mitigation plan that fully restores the river and its wild salmon by restoring streamflow and providing fish passage past the remaining Eklutna dam.

The Eklutna River is important to the people of the Native Village of Eklutna and the neighboring communities and nearby cities. Restoring robust wild salmon populations to the Eklutna will help restore subsistence opportunities, promote new recreation opportunities, and rebuild a wild salmon population in the heart of Southcentral Alaska that we can all be proud of.

Trout Unlimited Form Letter – Version 3

Now is your time to act for Eklutna salmon. As operators of the Eklutna Hydroelectric Project, you are legally required to make up for the project's impacts to fish, wildlife and their habitat. The decisions you make today will determine whether Eklutna salmon can recover and once again return in abundance. The fate of Eklutna wild salmon is in your hands. Please respect the gravity of your actions and choose accordingly.

Native Village of Eklutna has clearly communicated their vision for thriving wild salmon in the Eklutna River, including in Eklutna Lake and headwater tributaries. Your ratepayers and Alaskans support this vision. The Eklutna Hydroelectric Project deprives the Eklutna River of water and blocks salmon from migrating in and out of Eklutna Lake. The utilities have the obligation to make up for these impacts and do right by the Eklutna people and the Eklutna River.

Salmon populations will not recover without a reliable and consistent supply of water and access to important up-stream spawning and rearing areas. Sockeye salmon will not return if they cannot access Eklutna Lake and its tributaries. CEA, MEA and MOA cannot meet their mitigation obligations with anything less. Since it was originally built in 1955, Eklutna Hydroelectric Project has been a barrier to salmon migration and cut off water to the Eklutna River, causing a dry channel devoid of salmon for most of its length. Now is your one chance to make this right.

Trout Unlimited Form Letter – Version 4

To the operators of the Eklutna Hydroelectric Project,

The draft Fish and Wildlife Plan you proposed for the Eklutna River does not meet the needs of salmon, the vision of the Eklutna Peoples, or your legal obligation to mitigate the project's impact to fish and wildlife. Leaving a mile of the river dry, releasing only 3% of historic flows, and not providing fish passage into the lake and upstream habitat will not restore the river's salmon runs and are unacceptable. Instead of wasting ratepayer and taxpayer money on a mitigation plan that won't fully revive salmon runs, I ask you to remove the Eklutna Dam to fully reconnect the river and return the water flows needed to support the river's fisheries. I understand the reliance on this hydroelectric energy source in the near-term, and the proposal to remove the Eklutna Lake dam within the next decade, when replacement renewable energy is expected to be available, is reasonable. I also appreciate that community partners are willing to pitch in to help offset costs of the dam removal – taking advantage of this opportunity seems like a fiscally smart decision. The Native Village of Eklutna has clearly communicated their vision for thriving wild salmon in the Eklutna River, including Eklutna Lake and headwater tributaries. Your ratepayers and many Alaskans support this vision. The Eklutna Hydroelectric Project deprives the Eklutna River of water and blocks salmon from migrating in and out of Eklutna Lake. Salmon populations will not recover without a reliable and consistent supply of water and access to important up-stream spawning and rearing areas. This is particularly true for sockeye salmon, if they cannot access Eklutna Lake and its tributaries. CEA, MEA and MOA cannot meet their mitigation obligations within their budget constraints with anything less than removing the dam. Now is your one chance to make this right. Now is your chance to invest in a river that Alaskans can be proud of and help show the world that Anchorage does not just love our salmon, we know what it takes to care for them and actively work to bring them back.

The Alaska Center Form Letter

Dear Owners of The Eklutna Hydroelectric Project,

This comment is in regard to the Eklutna Hydroelectric Project's Draft Fish and Wildlife Program for the Eklutna River. I do not believe the plan's proposal to utilize the existing Anchorage Water and Wastewater Utility (AWWU) water supply infrastructure meets the needs of salmon, the vision of the Eklutna Peoples, or your legal obligation to mitigate the project's impact on fish and wildlife. I support the Native Village of Eklutna's vision for river restoration and ask you to consider dam removal to fully reconnect the river and return the water flows needed to support the river's fisheries.

The current proposal leaves a mile of the river dry, releases only 3% of historical flows, and does not provide fish passage into the lake and upstream habitat. Salmon populations will only recover with a reliable and consistent water supply and access to crucial upstream spawning and rearing areas. This proposal is unacceptable and needs to go further to restore the river's salmon runs.

The Native Village of Eklutna has communicated its vision for thriving wild salmon in the Eklutna River; dam removal is the most effective way to achieve this important goal. I understand the reliance on this hydroelectric energy source in the near term. But removing the Eklutna Lake dam within the next decade, when replacement renewable energy is expected to be available, is reasonable.

Now is your one chance to make this right. Please consider removing the Eklutna Dam so that all five species of salmon can once again return to the river.

Salmon State Form Letter

Dear Operators of the Eklutna Hydroelectric Project,

Thank you for the opportunity to comment on the draft Fish and Wildlife Plan proposed for the Eklutna River. Thriving salmon runs are essential to the majority of Alaskans — whether as a source of income, a way to practice culture or a way of filling the freezer. Unfortunately, the Eklutna River has been disrupted for nearly 70 years, causing salmon to significantly struggle, impacting the Peoples of Eklutna and Southcentral residents. The proposed plan, unfortunately, omits a complete mile between the lake and the portal valve which would continue to prohibit salmon from returning to the lake and upper tributaries to spawn. The plan would also fail to return the river to its historic flow levels, further impacting habitat and wildlife.

I strongly urge you to heed the recommendations of the Native Village of Eklutna to remove the dam and fully restore the Eklutna River. Not only would removing the dam restore salmon to the river, it would avoid financially burdening utility ratepayers and MOA taxpayers with a short-term, insufficient plan. Instead, the dam removal costs could be covered by two nonprofit organizations who have agreed to pay for it.

You have the opportunity to be leaders in learning from historic mistakes of damming rivers, in restoring a wild salmon run, and in righting a historic wrong on the Eklutna River.

Eklutna Hydroelectric Project
Comparison to Existing Conditions

Evaluation Parameter	Existing Conditions	Proposed Final Fish and Wildlife Program
Instream Flows		
Year-Round Instream Flows	There are currently no year-round flow releases from Eklutna Lake into the Eklutna River. There is some accretion (~4-6 cfs) between the Project Dam and the Thunderbird Creek (TBC) confluence. TBC mean daily flows peaked in June (81 cfs in 2021; 182 cfs in 2022) and ranged from 7 cfs to 27 cfs in the winter.	Provides year-round instream flows to the Eklutna River by utilizing the existing AWWU tunnel. This provides flow to 11 out of 12 miles of the river, varying from 40 cfs in the summer to 27 cfs in the winter. The Committee may request changes to the flow regime within the water budget and operational limitations. Addition inflows to the reservoir will be reallocated every 10 years between hydro generation and instream flows to potentially increase the water budget.
Periodic Channel Maintenance Flows	There have been 10 spill events since the current dam was constructed in 1965 (every 6 years on average). Spill events occurred between August and October, ranged in magnitude from 18 cfs to 1,022 cfs, and ranged in duration from 8 days to 74 days.	Provides channel maintenance flows in 3 out of 10 years utilizing a combination of flows from the AWWU portal valve and the existing drainage outlet gate at the base of the dam. Channel maintenance flows will occur in the fall, ramp up from 40 cfs to 220 cfs over 6 hours, hold at 220 cfs for 36 hours, then ramp back down to 40 cfs over 52 hours. The Committee may request changes to the channel maintenance flows within the water budget and operational limitations. A limited reopener for the fixed wheel gate 10 years after instream flows are established by allow for higher magnitude channel maintenance flows in the future if needed.

Water Quality		
Temperature	Winter water temperatures in the Eklutna River above the TBC confluence ranged from 0.9°C to 3.3°C on average. Peak water temperatures in the Eklutna River above the TBC confluence ranged from 6.2°C to 9.3°C in 2021 and from 7.6°C to 9.7°C in 2022. This meets ADEC water quality criteria (≤15°C).	Flow releases to the Eklutna River would come from the existing intake at Eklutna Lake. The water temperature in Eklutna Lake at the intake depth ranges from ~3°C in the winter to ~10-12°C in the summer, which meets ADEC water quality criteria (≤15°C).
Dissolved Oxygen (DO)	DO in the Eklutna River above the TBC confluence is >10mg/L throughout the year. This meets ADEC water quality criteria (≥7mg/L).	Flow releases to the Eklutna River would come from the existing intake at Eklutna Lake. DO in Eklutna Lake at the intake depth is >10mg/L throughout the year, which meets ADEC water quality criteria (≥7mg/L).
pH	pH in the Eklutna River above the TBC confluence ranged from 7.8 to a maximum of 8.6 in the summer, just above the ADEC criteria (8.5).	Flow releases to the Eklutna River would come from the existing intake at Eklutna Lake. pH in Eklutna Lake at the intake depth ranged from 7.9 to 8.1, which meets ADEC water quality criteria (8.5).
Geomorphology		
Substrate	Salmon prefer a substrate size of 16-128 mm for spawning gravel. - Coho prefer 16-64 mm - Chinook prefer 64-128 mm The average substrate size where salmon are currently spawning (below the TBC confluence) is ~25-30 mm. The average substrate size above the canyon from: - RM 5 to 6.5 ranges from ~75-16 mm (good for spawning) - RM 6.5 to 10 is <16 mm (bad for spawning) - RM 10 to 11 is ~16-64 mm (good for spawning)	The sediment transport modeling results indicate that the proposed channel maintenance flows will maintain the preferred substrate size of 16-128 mm throughout the majority of the potential spawning reaches in the Eklutna River, with significant improvements from RM 6.5 to 10. Based on monitoring results, the Committee may request changes to the channel maintenance flows within the water budget and operational limitations if needed. A limited reopener for the addition of a fixed wheel gate 10 years after instream flows are established would allow for higher magnitude channel maintenance flows in the future if warranted.

Fish Passage		
Canyon Reach	The minimum flow required for adult salmon to migrate up through the canyon is ~40 cfs. Flows in the canyon currently range from ~4-6 cfs. Therefore, adult salmon are currently unable to migrate through the canyon.	Modeling indicates that the proposed 40 cfs flow release from the AWWU portal valve in the summer, plus the ~4-6 cfs of accretion above TBC, should allow adult salmon to migrate through the canyon. Based on monitoring results, the Committee may request changes to the instream flow regime within the water budget and operational limitations if needed.
Beaver Dams	There are several beaver dams in the Eklutna River below the railroad bridge. However, adult salmon have been observed above those dams, which indicates that they are not a barrier to upstream fish passage. There are 6 additional beaver dams above the canyon, the largest of which is 6 feet tall. It is unknown if these are a barrier to fish passage since adult salmon currently cannot reach this section of the river.	It is likely that increased flows in the Eklutna River will encourage beavers to build their dams on side channels instead of in the main channel, which should not impede upstream fish passage. Physical habitat enhancement funding may be used by the Committee to remove any beaver dams that are a barrier to fish passage if needed.
Project Dam	The dam does not currently have any volitional fish passage facilities; however, adult salmon are not currently able to reach the dam due to insufficient flows. Trap and haul of fish from the river into the lake is not currently being done.	The Proposed Final Program does not include any volitional or trap and haul fish passage into or out of Eklutna Lake at this time. However, the limited reopener for fish passage may allow fish passage measures to be implemented in the future (any time more than 10 years after instream flows are established) as long as they meet specific criteria.
Spawning Habitat		
Chinook	0.7 acres	2.2 acres (this is a 209% increase and represents 96.5% of the max available habitat below the AWWU portal valve and 81.7% of the max available habitat in the Eklutna River)
Coho	2.5 acres	4.1 acres (this is a 65% increase and represents 99.6% of the max available habitat below the AWWU

		portal valve and 83.7% of the max available habitat in the Eklutna River)
Pinks	Pink salmon are known to utilize the lower Eklutna River for spawning; however, spawning habitat for pink salmon was not quantified.	The Aquatics TWG agreed that flows benefiting Chinook and coho should also benefit pink salmon.
Chum	Chum salmon are known to utilize the lower Eklutna River for spawning; however, spawning habitat for chum salmon was not quantified.	The Aquatics TWG agreed that flows benefiting Chinook and coho should also benefit chum salmon.
Sockeye	No adult sockeye salmon were observed spawning in the Eklutna River by the Project Owners or NVE.	While the year-round flow releases may technically create spawning habitat for sockeye in the Eklutna River, sockeye generally rear in lakes and the Proposed Final Program does not propose fish passage into Eklutna Lake at this time. Therefore, any sockeye habitat that may technically be created in the Eklutna River is not included in the habitat benefits related to the Proposed Final Program. However, the limited reopener for fish passage may allow fish passage measures to be implemented in the future (any time more than 10 years after instream flows are established) as long as they meet specific criteria.
Rearing Habitat		
Chinook	11.8 acres	18.1 acres (this is a 53% increase) It should also be noted that beaver dams in the river above the canyon may create additional rearing habitat; however, this was not quantified. Physical habitat enhancement funding provided in the Proposed Final Program may be used by the Committee to improve rearing habitat in the river as deemed appropriate.

Coho	14.7 acres	24.6 acres (67% increase) It should also be noted that beaver dams in the river above the canyon may create additional rearing habitat; however, this was not quantified. Physical habitat enhancement funding provided in the Proposed Final Program may be used by the Committee to improve rearing habitat in the river as deemed appropriate.
Pinks	Pink salmon are known to utilize the lower Eklutna River for rearing; however, rearing habitat for pink salmon was not quantified.	The Aquatics TWG agreed that flows benefiting Chinook and coho should also benefit pink salmon.
Chum	Chum salmon are known to utilize the lower Eklutna River for rearing; however, rearing habitat for chum salmon was not quantified.	The Aquatics TWG agreed that flows benefiting Chinook and coho should also benefit chum salmon.
Sockeye	Sockeye generally rear in lakes. Ocean-run sockeye cannot currently access Eklutna Lake; however, the current water quality conditions in Eklutna Lake (high turbidity, low nutrients, low productivity) indicate that it would not support a large sockeye run. This is supported by the current condition of the kokanee (land-locked sockeye) population in Eklutna Lake, which is poor (undersized and low fecundity with no sexual dimorphism or coloration).	The Proposed Final Program does not propose any volitional or trap and haul fish passage into Eklutna Lake at this time; therefore, no change in sockeye rearing habitat is anticipated. However, the limited reopener for fish passage may allow fish passage measures to be implemented in the future (any time more than 10 years after instream flows are established) as long as they meet specific criteria.
Winter Habitat	The current overwintering strategy for salmon in the Eklutna River is unknown. However, modeling indicates that low winter flows may be causing unfavorable ice conditions (frazil ice and anchor ice) in the river.	Modeling indicates that the proposed 27 cfs flow release from the AWWU portal valve in the winter, plus the ~4 cfs of accretion above the TBC and ~7-27 cfs from TBC itself, should promote good ice conditions (surface ice) in the river. Based on monitoring results, the Committee may request changes to the flow regime within the water budget and operational limitations if needed.

Wetlands		
Estuary	There are 487.0 acres of habitat in the Eklutna River estuary below the railroad bridge. The brackish habitat types in this area have a high ranking for wetland function.	Since the Eklutna River estuary already receives flows from TBC (mean daily flows peaked in June at 81 cfs in 2021 and 182 cfs in 2022) the proposed base flow releases from the AWWU portal valve (40 cfs in the summer months) are not likely to significantly impact the quantity or quality of estuary habitat.
Riparian Zone	There are 42.5 acres of habitat in the flooded forest (area between the railroad bridges and the highway bridges) with a low to moderate ranking for wetland function. There are 46.9 acres of seasonally flooded Alder-Willow shrub scrub located above the canyon in portions of the dewatered Eklutna River channel with a high ranking for wetland function.	Channel maintenance flows are expected to remove the small, linear strip of riparian shrub along the narrowed stream channel in the upper and middle river. Overbank flooding and sediment deposits could, over time, promote greater cover of streamside cottonwoods in mixed forests. Physical habitat enhancement funding may be used by the Committee for vegetation management as deemed appropriate.
Littoral Zone	There are 114 acres of freshwater littoral habitat near the outlet of Eklutna Lake with a low to moderate ranking for wetland function.	Since there are no proposed changes to reservoir operations, the quantity and quality of littoral habitat near the outlet of Eklutna Lake is not likely to change significantly.
Wildlife		
Bears	Camera traps were deployed throughout the Eklutna River in 2022. A total of 32 black bear groups and 14 brown bear groups were recorded, some with 1-3 cubs. Both black and brown bears were seen throughout most of the river corridor. However, there were more brown bears seen below the canyon and more black bears seen above the canyon.	Increased salmon abundance will likely benefit and may attract more bears to the area. This could potentially increase competition between black and brown bears for prime fishing habitats.
Moose	Moose were the most abundant wildlife species observed along the Eklutna River. A total of 352 moose	Increased salmon abundance should indirectly benefit moose (increased plant nutrients for forage); however,

	groups were recorded in 2022. A moose browse survey was also conducted in 2022. The results showed a 22% browse removal rate, which is indicative of a population that should be in good nutritional status with healthy twinning rates. However, few moose twins were observed, which may be due to moose calf predation.	increased salmon abundance may also attract more bears, which could lead to a heightened predation risk for moose.
Beavers	There is one long-standing active beaver colony (with 4 active dams) in the Eklutna River below the railroad bridge. Since the lower dam was removed in 2018, evidence of beavers started to be seen above the lower dam site. In 2022, there were 2 active beaver colonies above the canyon, each with a colony size of ≥3 beavers. The middle river colony has 6 active dams. The largest dam is over 6 ft tall and some of the dams have caused flooding along the AWWU access road. The upper river colony was removed by ADFG in late 2022 because the impoundment behind the beaver dam was flooding the AWWU access road.	The study flow releases in 2021 breached 2 beaver dams and completely removed a third. It is likely that increased flows in the Eklutna River will encourage beavers to build their dams on side channels instead of in the main channel.
Raptors	A raptor nest survey was conducted in 2022. Suitable nesting sites for bald eagles are limited to coastal areas. A total of 4 bald eagle nests were recorded near the coast, but only 1 nest was determined to be occupied. The eroding cliff substrate in the river above the canyon is very low quality for other nesting raptors. However, 2 raven (or possible goshawk) nests were recorded in the Eklutna River valley.	Increased salmon abundance will likely benefit and may attract more raptors to the area.

Marine Mammals	Beluga, harbor seals, and sea otters have been observed around the mouth of the Eklutna River.	Increased salmon abundance will likely benefit and may attract more marine mammals to the area.
Cultural Resources		
Natural Resources	Eklutna Village (Idlughet) is located near the mouth of the Eklutna River (Idluytnu). The Eklutna River drainage is an important subsistence area for the Eklutna Dena'ina. - Fishing – salmon - Hunting – moose, bear, sheep and ground squirrel - Gathering – berries, plants, trees, and stones	Increased salmon abundance will indirectly benefit other wildlife species, all of which are important subsistence resources for the Eklutna Dena'ina.
Archaeological Resources	There were no archaeological resources identified within the Area of Potential Effect (APE).	No impacts to archaeological resources are anticipated.
Historic Resources	The Eklutna Dam and Spillway and the Eklutna River Railroad Bridge are within the APE and are eligible for the National Register of Historic Places.	No substantial modifications to the dam or spillway are proposed at this time. If the fixed wheel gate is implemented, the Project Owners will consult with the SHPO regarding a determination of effects. ARRC had previously raised concerns about the potential for increased flows to impact the railroad bridge. However, the study flow releases in 2021 had no impact on the railroad bridge, and the proposed flows are well within the hydraulic capacity of the bridge. Therefore, no impacts to the railroad bridge are anticipated.
Municipal Water Supply		
Water Availability	AWWU's water right allows them to divert up to 41 million gallons per day (MGD); however, on average AWWU only diverts ~31 MGD.	The Proposed Final Program proposes to utilize the excess capacity in the AWWU tunnel for providing flows to the Eklutna River. This will not impact AWWU's ability to divert up to 41 MGD. In addition, several engineering measures are

		proposed to prevent any potential disruption to the public water supply.
Water Treatment	Four step process: coagulation / flocculation, sedimentation, filtration, and disinfection.	Because the Proposed Final Program does not propose fish passage into Eklutna Lake at this time, no impact to the water quality in Eklutna Lake is anticipated. Therefore, no change in water treatment is required. The Committee is required to obtain AWWU's consent or approval of any fish passage measures they may propose in the future as part of the limited reopener.
Water Supply Infrastructure	AWWU's buried pipeline follows the Eklutna River for 6 miles, crossing it 8 times before exiting the valley to the water treatment facility. The pipeline is buried ~5 feet deep, and the crossings are armored; therefore, no impacts to the buried pipeline are anticipated. AWWU's access road follows the buried pipeline and crosses the river 10 times. Of the 10 crossings, 2 of them are bridges and 8 of them are fords. The AWWU bridges have a hydraulic capacity of ~1,000-1,200 cfs.	Year-round base flows will prevent AWWU from crossing the river at the 8 fords. Therefore, the Proposed Final Program proposes to construct 8 new bridges at these crossing to allow continued access by AWWU once the instream flow regime is implemented.
Other Downstream Infrastructure		
Old Glenn Highway Bridge	The current bridge was constructed in 2015 and has a hydraulic capacity of >1,800 cfs. Since 2015, the largest flow release from the dam was the study flow releases in 2021 which had a max flow release of 150 cfs and resulted in a peak mean daily flow of 215 cfs in the lower river. In 2022, the peak mean daily flow was 270 cfs. Neither of these flows in 2021 or 2022 impacted the bridge.	Increasing flows in the Eklutna River by 27 cfs in the winter, 40 cfs in the summer, and 220 cfs during peak flows is well within the hydraulic capacity of the Old Glenn Highway bridge.
New Glenn Highway Bridges	These bridges were constructed in 1975 and have a hydraulic capacity of >4,700 cfs. Since 1975, the largest	Increasing flows in the Eklutna River by 27 cfs in the winter, 40 cfs in the summer, and 220 cfs during peak

	flow release from the dam was the spill event in 1995 which had a max flow of 1,022 cfs. This did not impact the highway bridges, but it did occur before the lower dam was removed in 2018. ADOT&PF previously raised concerns about how all the accumulated sediment that was left in the river after the lower dam removal would be transported downstream and may impact the highway bridges. In 2021, the Project Owners conducted a series of study flow releases with a max flow release of 150 cfs. These flows did not impact the highway bridges.	flows is well within the hydraulic capacity of the New Glenn Highway bridges.
Railroad Bridge	The current bridge pre-dates the existing hydro project and has a hydraulic capacity of >8,000 cfs. Since 1965 when the existing dam was constructed, the largest flow release from the dam was a spill event in 1995 with a max flow of 1,022 cfs. This did not impact the railroad bridge, but it did occur before the lower dam was removed in 2018. ARRC previously raised concerns about how all the accumulated sediment that was left in the river after the lower dam removal would be transported downstream and may impact the railroad bridge. In 2021, the Project Owners conducted a series of study flow releases with a max flow release of 150 cfs. These flows did not impact the railroad bridge.	Increasing flows in the Eklutna River by 27 cfs in the winter, 40 cfs in the summer, and 220 cfs during peak flows is well within the hydraulic capacity of the railroad bridge.
Recreational Use and Facilities		
Lakeside Trail	A recreation survey was conducted in 2022. The Eklutna Lakeside Trail was the most frequently reported destination in the area, with >400	Chugach State Park has received funding to repair the sections of the trial that are currently impacted by erosion at high lake levels, and the

	pedestrians per day in the summer months. The trail is open to motorized use Sunday-Wednesday and non-motorized use Thursday-Saturday. There are areas where the trail splits, with the non-motorized trail closer to the lake shoreline. Current reservoir operations cause some erosion of the non-motorized trail at high lake levels.	Project Owners will provide match funding upon Governor's approval. Since the Proposed Final Program does not propose any changes to reservoir operation, no additional impacts are anticipated.
Campground and Cabins	The nearby Eklutna Lake Campground has 50 campsites and is a popular camping area. There are also 2 popular cabins near the dam.	No impacts to the campground or the cabins are anticipated.
Kayaking	Kayaking is a popular activity on Eklutna Lake.	No impacts to kayaking are anticipated.
Tailrace Fishery	ADFG stocks Chinook and coho smolts at the Project tailrace to support a recreational fishery. In 2022, a minimum of 31,447 recreators partook in activities (mostly fishing) at the tailrace between June 8 and August 23.	With the Proposed Final Program, water from Eklutna Lake will now be released into both the Project tailrace and the Eklutna River. Salmon returning to the tailrace will first pass by the mouth of the Eklutna River and may stray into the river. This could decrease the number of adult salmon returning to the tailrace each year, which could impact the tailrace fishery. Therefore, a straying study must be conducted as part of the monitoring plan. If significant straying is observed, the appropriate mitigation measures will be determined in coordination with ADFG.
Eklutna River Fishery	Most of the land around the river is owned by Eklutna, Inc. There is currently no free, non-permitted public access to the Eklutna River.	The Project Owners have requested that Eklutna, Inc. provide free, non-permitted public access to the Eklutna River once fishing for Chinook, coho, or sockeye is allowed.
Hunting	ADFG regulates hunting and trapping activities in the Eklutna Lake Management Area, which is closed to all hunting except by bow and arrow.	Bears and potentially moose are likely to benefit from increased salmon abundance, which could

	The taking of moose, brown bear, and sheep requires a permit, and the taking of black and brown bears requires completion of a hunter safety course.	improve hunting opportunities for these species in the area.
Wildlife Viewing	Some people reported wildlife viewing as one of their intended recreational activities in the Eklutna area.	Increased salmon abundance and the indirect benefits to other wildlife species will likely improve wildlife viewing opportunities in the area.
Safety		
Wildlife-Human Interactions	Negative wildlife-human interactions, while not common within Chugach State Park, are a public safety concern as visitors seek to view wildlife and use park resources for recreational pursuits. At least half of the 12 people injured or killed by bears in Chugach State Park since its establishment were within 100 yards of salmon spawning streams.	Increased salmon abundance may attract more bears to the area, which could increase negative bear-human interactions near the campground. However, the year-round base flows will be released at the AWWU portal valve approximately 1 mile downstream of the dam and campground. Therefore, any increase in negative bear-human interactions should be low.
Flood Protection	The entire volume of the Probable Maximum Flood can be contained in the flood storage capacity of the reservoir with 3 feet of freeboard remaining even if the spillway was blocked.	Because there are no proposed changes to reservoir operations, there will be no change in the flood storage capacity.
Power Production		
Generation	Average annual generation at the Eklutna Power Plant is approximately 169,000 MWh per year.	The water released into the river will not go through the powerhouse and will result in a net reduction of 16,100 MWh per year. This is a 10% reduction on average.
Grid Reliability	The Project provides grid reliability through diversification of fuel for generation.	While the Project would continue to provide grid reliability through diversification of fuel for generation, its benefit would be slightly reduced.
Renewable Integration	The Project can be used to firm other intermittent renewables (wind and solar).	While the Project could still be used to firm other intermittent renewables, its benefit would be slightly reduced.

Other Aspects of Environmental Quality		
Carbon Offsets	The Project offsets approximately 72,500 metric tons of CO_2 equivalent per year.	Carbon offsets would decrease by 6,900 metric tons of CO_2 equivalent per year. This is a 10% reduction on average.
Costs		
Capital Improvements	-	$20,482,860 with the fixed wheel gate
Operations and Maintenance	-	$315,900 (per year)
Replacement Energy	-	$1,333,188 (per year)
Total Annualized Cost	-	$4,043,000 (per year)
Potential Ratepayer and Taxpayer Impacts		
Chugach Electric	-	+0.78%
Matanuska Electric	-	+1.07%
Municipality of Anchorage	-	+$1.03 (per $100k of property value)

1.0 Introduction

1.1 Purpose

The purpose of this report is to present the design documentation associated with the development of the Anchorage Water and Wastewater Utility (AWWU) Maintenance Road and Bridges Improvements (Project) as part of the Eklutna Fish & Wildlife Program. The design documentation report (DDR) summarizes the pertinent data, design criteria, and standards used as the basis for the 15% level of design of the Project. The DDR documents the data, criteria, and standards by engineering discipline, and provides information about the operation of the design components associated with the Project.

The information presented within this DDR will be updated throughout the design development process to reflect refinement of the Project components and facilities, and advancement of the design analysis and details.

1.2 Location

The Project site is located in Southcentral Alaska approximately 30 miles northeast of downtown Anchorage near the Native Village of Eklutna. The Project footprint spans across lands owned and managed by the State of Alaska, Eklutna Inc., and the Bureau of Land Management (BLM). As proposed, the Project involves the construction of eight new bridges along the AWWU maintenance road to cross the Eklutna River, as shown in Figure 1-1.

1.3 Background and Objectives

As part of the Eklutna Fish & Wildlife Program, Chugach Electric Association, Matanuska Electric Association, and the Municipality of Anchorage, known collectively as the Owners of the Eklutna Hydroelectric Project (Owners) are studying various means of providing water to the Eklutna River to mitigate damages to, and to enhance fish and wildlife impacted by the development of the project. A measure under careful consideration by the Owners is the implementation of a new river release structure, utilizing some of the infrastructure owned and operated by AWWU, to restore flows to the Eklutna River. With the future instream flow released into the Eklutna River, a potential risk is imposed on AWWU O&M crew who utilize the existing river crossings to maintain, repair, or inspect the buried pipeline. These river crossings may not be fordable by vehicle in their current conditions. This Project seeks to construct bridges at the locations of the river crossings to maintain access along the AWWU Maintenance Road.

1.4 Report Organization

This DDR is a record of the design effort for the Project and specifically describes the details of the design process and work effort for the improvements of the AWWU Road and Bridges. The DDR consists of a summary of the design elements, criteria, methods and approach, engineering calculations, and pertinent references. The major report sections and intended purpose are presented in Table 1-1.

Table 1-1. Major Report Sections and Purpose.

Section	Description	Purpose
1	Introduction and Background	Presents the Project purpose, location, background, objectives, and the report organization.
2	General Description	Summarizes the basic design criteria that are used as the basis of design.
3	Existing Infrastructure	Summarizes the existing infrastructure related to the Project.
4	Civil Design	Includes information related to the civil design of the realignment and gradient of the AWWU Road, including erosion and sediment control measures.
5	Structural Design	Includes information related to the structural design of the bridges.
6	References	Documents the references used in developing the design.
Appendices		
A	15% Design Drawings	Presents the 15% design drawings for the AWWU Maintenance Road and Bridges.
B	Class 4 OPCC	Presents the Class 4 Opinion of Probable Construction Costs for the AWWU Maintenance Road and Bridges.

2.0 General Description

2.1 General Design Criteria and Standards

General design criteria and standards for the Project include the abbreviations, survey datum, topographic mapping, references, and design standards as described below.

2.1.1 Standard List of Terms and Abbreviations

AACE	Association for Advancement of Cost Engineering
AASHTO	American Association of State Highway Transportation Officials
AC	alternating current
ACI	American Concrete Institute
AISC	American Institute of Steel Construction
ANSI	American National Standards Institute
ASTM	American Society of Testing and Materials
AWWA	American Water Works Association
AWWU	Anchorage Water and Wastewater Utility
BMP	Best Management Practice
CADD	computer aided design and drafting
CEA	Chugach Electric Association
cfm	cubic feet per minute
cfs	cubic feet per second
CGP	Construction General Permit
DC	direct current
DDR	Design Documentation Report
DEM	Digital Elevation Model
DSM	Digital Surface Model
El.	elevation
ESC	Erosion and Sediment Control
fps	feet per second
ft	feet
GCP	Ground Control Points

GGDVLVLR	Guidelines for Geometric Design of Very Low Volume Local Roads
HDC	Hydraulic Design Criteria
HEC	Hydrologic Engineering Center
IBC	International Building Code
LiDAR	Light Detection and Ranging
MEA	Matanuska Electric Association
MGD	million gallons per day
MOA	Municipality of Anchorage
MSL	Mean Sea Level
NAD83	North American Datum of 1983
NAVD88	North American Vertical Datum of 1988
NEC	National Electric Code
NEMA	National Electrical Manufacturers Association
NESC	National Electrical Safety Code
NFPA	National Fire Protection Association
NGVD29	National Geodetic Vertical Datum of 1929
NVE	Native Village of Eklutna
O&M	operation and maintenance
pcf	pounds per cubic foot
PLC	programmable logic controller
psi	pounds per square-inch
SWPPP	Stormwater Pollution Prevention Plan
USGS	U.S. Geological Survey
UTM	Universal Transverse Mercator
V	volt
WSEL	water surface elevation

2.2 Mapping and Imagery

2.2.1 Survey Datum

McMillen contracted NV5 Geospatial to conduct LiDAR survey flights over the Project Area on May 28, 2020, and on May 18, 2022. Both datasets were presented in the NAV88 (GEOID12B), NAD83 (2011) and were projected to the UTM Zone 6N. The data was measured in metric units. For both datasets, Ground Control Points were established by A. William Stoll (AK PLS#12041) with DOWL INC, to provide geospatial correction of the aircraft positional coordinate data and for quality assurance.

The survey vertical datum that was utilized as the basis of this Project is NAVD88 (GEOID12B) in terms of elevation with respect to Mean Sea Level (MSL). The horizontal datum was reprojected to NAD83 (2011) Alaska State Plan Zone 4. Units were converted from metric to imperial (U.S. Feet).

2.3 Topography, Bathymetric and Imagery

Both the 2020 and 2022 LiDAR data were used selectively for the topography and bathymetry of the Eklutna River to accurately depict the geometry and water depth of the Eklutna river. The 2022 Imagery dataset was used for the aerial shown on the Drawings. LiDAR and imagery specifications are detailed in Table 2-1 below.

Table 2-1. LiDAR and Imagery Specifications

Date	Type	Data	Format	Equipment
May 2020	Rasters	LiDAR DEM	0.5 Meter GeoTIFF Bare Earth	Leica ALS80
		LiDAR DSM	0.5 Meter GeoTIFF Highest Hit	Leica ALS80
	Digital Imagery	Imagery	15 Centimeters GeoTIFFs, 3-Band, 8-bit (RGB)	UltraCAM Eagle M3
May 2022	Rasters	LiDAR DEM	0.5 Meter GeoTIFF Bare Earth	Leica ALS80
		LiDAR DSM	0.5 Meter GeoTIFF Highest Hit	Leica ALS80
	Digital Imagery	Imagery	15 Centimeters GeoTIFFs, 4-Band 32-bit (RGB-Ir)	UltraCAM Eagle M3

2.4 Geotechnical Data

At the present phase of development of the proposed facilities, site specific geologic and geotechnical investigations have not been performed. The basis of the geotechnical design for the facilities associated with the lake diversion tunnel and portal valve structure is the design summary report for the Eklutna Water Project (AWWU 1985). Additional geotechnical information was obtained for the vicinity around Eklutna Dam from the technical record of design and construction (USBR 1958).

3.0 Existing Infrastructure

Existing infrastructure information was extracted from the Eklutna Hydroelectric Project Existing Infrastructure Assessment Study Report, submitted in February 2022 by McMillen Inc (McMillen 2022). For additional information relating to the infrastructure discussed and for all other infrastructure not detailed in this section, refer to that Study Report.

3.1 AWWU Access Road

The AWWU Access Road is a 6.5-mile-long gravel road following the AWWU Pipeline along the Eklutna River. The road crosses the river in ten (10) locations, two (2) of which consist of a short spanning bridge and eight (8) requiring fording the river on foot or with a vehicle to the extent possible.

Table 3-1. River Crossing Locations and Descriptions

Crossing No.[1]	River Mile	Description
1	6.5	Natural Bottom Ford
2	6.9	Natural Bottom Ford

[1]Crossing Number are label based on the distance along Eklutna River and do not correspond with crossing numbering system shown on the Drawings.

The full extent of the AWWU access road was assessed during a field visit in September 2021 to determine the current condition of the road prior to releasing flows into the river. Crossings 1 - 7 were determined to be in acceptable condition, with no signs of advanced erosion. The bridges at crossings 9 and 10 were in good condition, with no evidence of scour at the bridge abutments. Crossing No.8 at river mile 10.3 was inundated to a depth of approximately 3-feet by a beaver dam constructed along the road. A second, larger beaver dam constructed at or around river mile 7.2 was causing inundation of the roadway between river crossing 2 and 3 to a depth of approximately 3-feet.

The AWWU road provides operations and maintenance access to the portal valve shaft and the buried water conveyance pipeline along the Eklutna River and is intended to be accessible year-round under normal flow conditions along the Eklutna River. The river ford crossings

were cut to provide a uniform 4:1 slope transitioning into and out of the riverbed and surfaced to prevent significant erosion under normal flow conditions. The standard design for each river crossing, as detailed in the AWWU pipeline design drawings, can be seen in Figure 3-1.

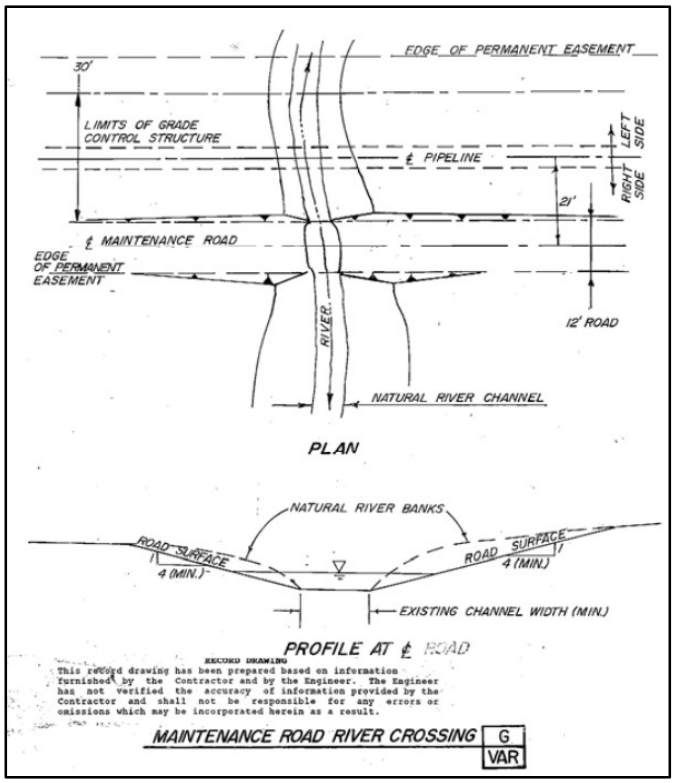

Figure 3-1. Maintenance Road River Crossing Standard Detail (AWWU 1986).

4.0 Civil Design Criteria

4.1 General Description

This section presents the civil design elements for the Access Road improvements and summarizes the civil design criteria, stormwater design, grading criteria, and the erosion and sediment control requirements during and post-construction.

4.2 Design Criteria

The Project is located in the Municipality of Anchorage in Alaska; therefore, during construction and after construction, the Project will be required to comply with all federal, state, and county standards and requirements. Given that the primary function of the existing AWWU Access Road is to provide access for maintenance of the AWWU pipeline, the design criteria for the roadway geometrics will adhere to AASHTO Guidelines for Geometric Design of Very Low-Volume Local Roads (GGDVLVLR). The Civil design elements adhered to the codes and standards administered and authorized by the following agencies and jurisdiction listed in Table 4-1.

Table 4-1. Codes and Standards

Codes & Standards	Description
AASHTO	American Association of State Highway and Transportation Officials
DOT&PF	Alaska Department of Transportation and Public Facilities
IBC	International Building Code
MOA	Municipality of Anchorage

4.2.1 Bridge Approach and Roadway Crossings

The existing natural-bottom ford crossings 1-8, listed in Table 3-1, are the locations where new bridges will be constructed. Some of the approaching alignments of the crossings have been shifted to ensure design criteria was met, but in general the proposed bridge crossings are in relatively the same location as the existing natural-bottom ford crossings. The proposed alignments were created using an iterative process which involved determining the geometry of the Eklutna River based on the topographical LiDAR data, placing the center point of the bridge such that the abutments on either side would not encroach on the existing river geometry, and tying the proposed bridge alignment back to the existing road alignment on either side of the bridge approach. See Figure 4-1 below for the proposed river crossing locations.

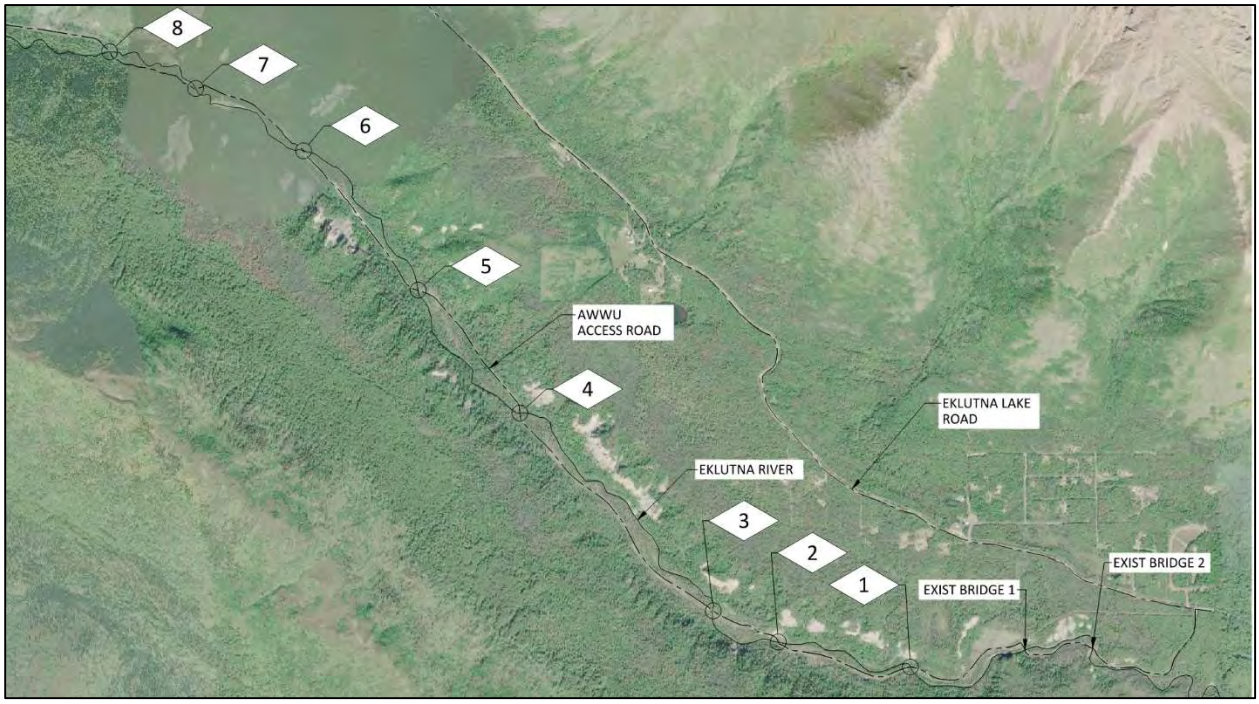

Figure 4-1. River Crossing Locations

4.2.2 Grading

The design of the grading slopes for cut and fill for the roadway section meets the requirements of the Anchorage Code of Ordinances. As required by the code, without a slope stability analysis or otherwise recommended in an approved soils engineer report, slope of fill and slope of excavation was designed to not be any steeper than safe for intended use and will not be steeper than 1 unit vertical in 2 units horizontal. The grading criteria are listed in Table 4-2.

Table 4-2. Grading Criteria

Criteria	Units	Value	Comments / Descriptions / References
Cut Slope	ft:ft	2H:1V	(Anchorage, 2023, 23.105.107.2)
Fill Slope	ft:ft	2H:1V	(Anchorage, 2023, 23.105.108.5)

4.2.3 Roadway Geometrics

The existing AWWU Maintenance Road can be classified by AASHTO as a low-speed Rural Minor Access Road due to characteristics such as the following: having a narrow road width, having a winding alignment, having periodic one-lane sections, having an unpaved surface,

being a private road, and being predominately used by familiar drivers for maintenance (AASHTO 2001, 6). The GGDVLVLR recommends selecting a design speed that will realistically represent the anticipated operating speed on the roadway being designed, additionally, for low-speed roads, the GGDVLVLR recommends selecting a design speed between 0 and 45 mph at increments of 5 mph (AASHTO 2001, 9)Due to existing characteristics of the road, and the surrounding mountainous terrain, a design speed of 15 mph was chosen for the approaches of the proposed bridge crossings. The roadway width was selected based on the required bridge width to accommodate a fully loaded construction dump truck and a 450 LC Excavator as needed for maintenance of the pipeline. All other design values for the proposed roadway geometry, summarized in Table 4-3, were chosen based on the design speed of 15 mph, surrounding mountainous terrain, and AASHTO standards.

Table 4-3. Roadway Design Criteria

Criteria	Units	Value	Comments / Descriptions / References
Design Speed	mph	15	(AASHTO 2001, 9)
Roadway Width	ft	15	
Road Surface Traction Coefficient	-	0.45	Coefficient for Loose Gravel; (AASHTO 2001, 52)
Stopping Sight Distance, SSD	ft	65	(AASHTO 2001, 39)
Min. Horizontal Curve Radius	ft	60	(AASHTO 2001, 22, 50, 51)
Max. Grades[1]	%	4	(AASHTO 2011, 3-115, 3-116)
Min. K[2], Rate of Vertical Curvature for Crest Curve	-	2	(AASHTO 2001, 39)
Min. K[2], Rate of Vertical Curvature for Sag Curve[3]	-	10	(AASHTO 2011, 5-4)

[1]AASHTO do not provide a clear maximum grade value based on the existing roadway characteristics. Based on an entering speed of 15 mph, and the relatively short length of the proposed approaches, figures 3-24 and 3-25 (AASHTO 2011, 3-115, 3-116) suggest that a maximum grade of 4% will ensure that trucks can maintain speed while traveling up/down grade.
[2]K-Value is a coefficient by which the algebraic difference in grade may be multiplied to determine the length in feet of the vertical curve that will provide the minimum sight distance.
[3]There are no special guidelines for design of sag vertical curves in GGDVLVLR (AASHTO 2001, 38)

4.2.4 Roadway Section

The typical roadway section used for the design of the proposed river crossing roads consists of a 15 ft-wide gravel road with a 2% grade away from the crown on both sides. In areas where the proposed roadway will require additional fill material, the edge of the roadway will continue towards existing ground at a minimum of a 2H:1V slope. In areas where the proposed roadway will require existing material to be removed, a ditch along the edge of the road will

be cut with minimum side slopes of 2H:1V and a flow line located 6 inches below the lowest aggregate base of the road. The section design ensures that water will drain adequately off and away from the road whether existing material needs to be added or removed. See Figure 4-2 below for a depiction of the proposed typical section.

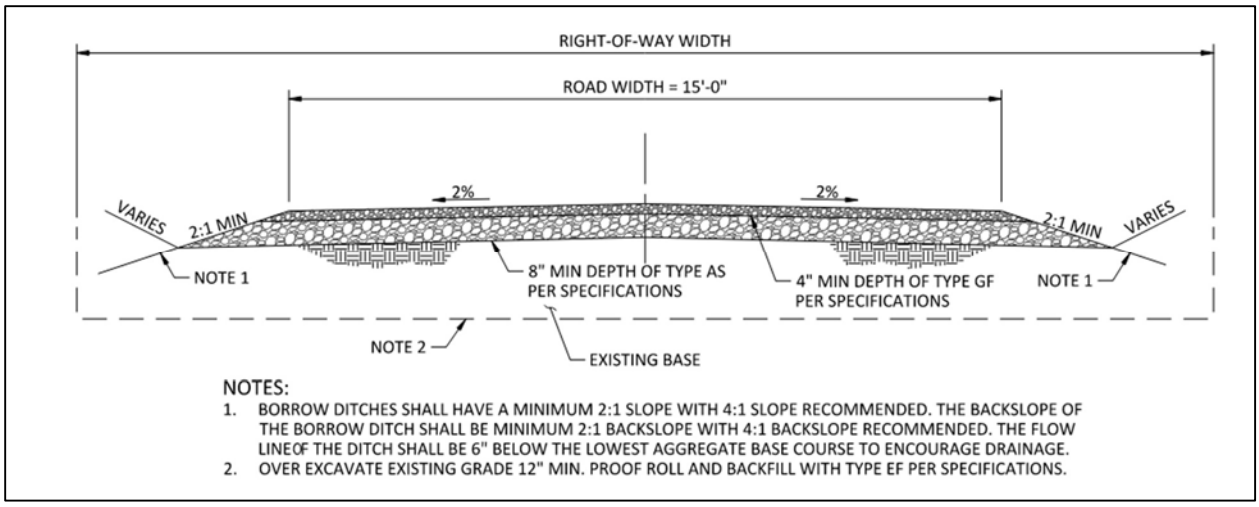

Figure 4-2. Typical Gravel Road Section

4.2.5 Stormwater Control

Stormwater control measures and facilities will be designed in compliance with MOA standards and requirements. Stormwater control measures and facilities will include surface drainage, road ditches and ditch relief culverts. The road ditches and culvert will be sized to convey the design storms listed in Table 4-4, in accordance with the guidelines set by Anchorage Stormwater Manual. Stormwater facility design criteria are listed in Table 4-5.

Table 4-4. Design Storm Criteria

Application	Design Storm	Comments / Descriptions / References
Minor Drainageway (Culverts)	10 year, 24-hour	(MOA 2017, Table 4.2-1)

Table 4-5. Stormwater Facility Criteria

Criteria	Units	Value	Comments / Descriptions / References
Min. Culvert Slope	%	0.5	(MOA 2017, 5.3.6.1)
Min. Culvert Spacing	ft	20	(MOA 2017, 5.3.6.1)
Min. Ditch Slope	%	0.5	(MOA 2017, 5.5.2)
Min. Ditch Side Slope	V:H	1:2	(MOA 2017, 5.5.2)

4.2.6 Erosion Control and Grading

Erosion and Sediment Control (ESC) measures in the drawings intend to reduce the potential for project-related activities causing erosion and sedimentation issues within the Project site or turbidity issues within the Eklutna River. These temporary and permanent construction activities may involve soil, rock, and vegetation removal, which could mobilize sediment resulting in soil erosion and/or sedimentation in the construction areas. The design will employ multiple standard control measures to prevent erosion and stream sedimentation in accordance with MOA Best Management Practices (BMP's). The drawings will serve as an aid for the contractor in developing a Stormwater Pollution Prevention Plan to obtain a construction general permit.

5.0 Structural Design Criteria

The structural design criteria apply to all design procedures to be implemented during the Project design. Structural design considerations listed in this section include detailing of Structural components, material selection, and design requirements that are intended to be incorporated into the Project.

5.1 Applicable Codes and Standards

The structural design will conform to the following reports, criteria, and industry codes and standards. The applicable version of each document is the latest edition in force unless noted otherwise. References to the specific codes and standards will be included in the applicable technical specifications as the final design documents are prepared. AASHTO is referenced for design live loads and general design methodology guidance, although the Project features are not specifically required to adhere to AASHTO design requirements.

Table 5-1. Structural Codes and Standards.

Number	Description
Building Code	
ASCE 7	ASCE 7/SEI 7-16 Minimum Design Loads for Buildings and Other Structures, 2016
Design Standards and References	
ACI 318	Building Code Requirements for Structural Concrete, 2014
ACI 350	Code Requirements for Environmental Engineering Concrete Structures, 2006
ACI 360R	Design of Slabs on Ground, 2006
AISC 360	Specification for Structural Steel Buildings, 2016

AWS D1.1	Structural Steel Welding Code – Steel
AASHTO	AASHTO LRFD Bridge Design Specifications – 8th Edition, 2017 with CA Amendments
2018 NDS	National Design Specification for Wood Construction, 2018

5.2 Materials

Materials and standards for concrete, concrete-related materials, structural steel, and miscellaneous metals for the Project are indicated in Table 5-2.

Table 5-2. Structural Materials and Design Standards.

Component	Material and Standard
Concrete and Related	
New Concrete	Minimum 28-day Compressive Strength, f'c = 4,500 psi
Reinforcing Steel	ASTM A615, Grade 60
Adhesive Anchors	Two component epoxy, ASTM C-881 (with SS threaded anchor rod or reinforcing dowels)
Structural Steel	
Wide Flange Shapes	ASTM A992, Grade 50ksi
M, C, L shapes	ASTM A572, Grade 50ksi
Tube (HSS)	ASTM A500, Grade C. (46ksi Round / 50ksi Rect.)
Plates and Bars	ASTM A572, Grade 50ksi
High-Strength Bolts	ASTM F3125, Grade A325
Anchor Rods	ASTM F1554, Grade 50ksi (threaded) A193, Type 316 Stainless Steel
Miscellaneous Metals	
Guardrail	Galvanized steel
Wood	
Wood Bridge Components	Douglas Fir (DF) Larch No. 2 or better

5.3 Design Loads

The general load types considered in the design of the structure are summarized in Table 5-3.

Table 5-3. Structural Design Loads.

Load Type	Description
Dead	Self-weight of all permanent structural elements as well as super-imposed weight of permanent mechanical and electrical equipment and piping.
Live	Temporary loads produced by the use of the bridge structures (excluding environmental loads). This load type includes those produced by movable objects and loads on guardrails. Design basis wheel loads and axle spacing is based on an HL-93 or the equipment producing the maximum wheel loads that may be used during the construction of all Project features.
Soil	Weight of moist or buoyant soil on the structure and lateral earth pressures against surfaces retaining soil (abutments).
Wind	Wind load parallel and perpendicular to the bridge span acting over solid surfaces.
Seismic	Inertial forces produced by ground motion during a seismic event. The effects of this load type on these structures and non-structural equipment will be approximated based on the provisions of ASCE7.
Thermal	Self-straining loads due to thermal variation. Maximum and minimum temperatures for the site location will be considered.

5.3.1 Design Basis for Bridge Structures

Per AASHTO, all bridge structures will satisfy Load Factor and Resistance Design (LRFD) methodology by providing the required strength defined by the equation below:

$$R_r = \sum \eta_i \gamma_i Q_i \leq \phi R_n$$

Where:

- $R_r =$ required strength
- $\gamma_i =$ load factors per AASHTO
- $Q_i =$ load effects per structural calculations
- $\emptyset =$ resistance factor from AASHTO
- $R_n =$ nominal resistance from AAHSTO

This methodology will be applied to the design of other material types in accordance with the relevant design standards and references. Refer to the structural calculations for additional information and derivation of these equation variables for specific Project features and components.

5.3.2 Description of Bridge Structures

A single bridge design will be provided for all site locations based on the site conditions producing the most extreme forces the structure may see. The bridge design will consist of a 15’-0” wide by 32’-0” long (clear dimensions) single-span bridge that is supported by sheet pile abutments at each end. The bridges will consist of dimensional lumber wearing surface beams bearing on dimensional lumber transverse beams. The transverse beams will be through bolted to each of the three steel girders (each end and at midspan). Cross bracing will be located between the girders to provide bracing against lateral-torsional buckling in addition to acting as a diaphragm, transferring out-of-plane lateral forces.

Timber rails and scuppers will be located along each side of the bridge spans for vehicle safety and to facilitate drainage off the structure. A 6’-0” minimum clearance will be provided between the riverbed and bottom of bridge to allow for adequate freeboard.

GENERAL NOTES:

1. THESE ABBREVIATIONS APPLY TO THE ENTIRE SET OF CONTRACT DRAWINGS.
2. LISTING OF ABBREVIATIONS DOES NOT IMPLY ALL ABBREVIATIONS ARE USED IN THE CONTRACT DRAWINGS.
3. ABBREVIATIONS SHOWN ON THIS SHEET INCLUDE VARIATIONS OF THE WORD. FOR EXAMPLE, "MOD" MAY MEAN MODIFY OR MODIFICATION; "INC" MAY MEAN INCLUDED OR INCLUDING; "REINF" MAY MEAN EITHER REINFORCE OR REINFORCING.
4. SCREENING OR SHADING OF WORK IS USED TO INDICATE EXISTING COMPONENTS OR TO DE-EMPHASIZE PROPOSED IMPROVEMENTS TO HIGHLIGHT SELECTED TRADE WORK. REFER TO CONTEXT OF EACH SHEET FOR USAGE.

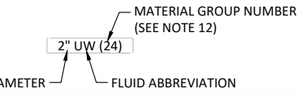
SDR	STORM DRAIN	--	21	--	21	NOTE 6	WATER	(C)

PIPING MATERIAL SCHEDULE (SEE NOTE 1)

GROUP NO.	PIPE MATERIAL	FITTINGS / JOINTS	LININGS AND COATINGS (SEE NOTE 13)
21	CORRUGATED METAL PIPE, GALVANIZED, AASHTO M36 (TYP SERVICE - DRAINAGE & CULVERTS)	FOR COUPLING AND END-PROTECTORS, SEE SPEC 02567	NO APPLICABLE

TYPICAL PIPE DESIGNATION:



NOTES:

NOTE 1
ALTHOUGH SEVERAL PIPE MATERIAL GROUPS MAY BE LISTED ON THIS SHEET FOR A GIVEN FLUID SERVICE, CONTRACTOR SHALL PROVIDE ONLY THE PIPE MATERIAL GROUP SHOWN ON THE DRAWINGS AND SPECIFIED FOR THAT FLUID SERVICE.

NOTE 2
LEAKAGE ALLOWANCE IS AS FOLLOWS
A. PIPES SO DESIGNATED SHALL SHOW ZERO LEAKAGE.
B. PIPES SO DESIGNATED SHALL SHOW ZERO LEAKAGE FOR UNBURIED PIPE AND NOT MORE THAN 0.02 GALLON PER HOUR PER INCH DIAMETER PER 100 FEET OF BURIED PIPE.
C. PIPES SO DESIGNATED SHALL NOT SHOW A LEAKAGE OF MORE THAN 0.15 GALLON PER HOUR PER INCH OF DIAMETER PER 100 FEET OF PIPE.
D. PIPES SO DESIGNATED SHALL NOT SHOW A LOSS OF PRESSURE OF MORE THAN 5 PERCENT.
E. PIPE SO DESIGNATED SHALL NOT SHOW A LOSS OF VACUUM OF MORE THAN 4 INCHES MERCURY COLUMN.

NOTE 3
FOR FIELD TEST PROCEDURES AND ADDITIONAL TEST REQUIREMENTS, SEE PIPING SECTION OF SPECIFICATIONS.

NOTE 4
NO SUBSTITUTIONS U.N.O. IN THE SPECIFICATIONS.

NOTE 5
PIPING GROUP FUNCTION SHOWN THUS * SHALL BE INSULATED PER SPECIFICATIONS.

NOTE 6
STATIC WATER TEST WITH SURFACE 5 FEET ABOVE HIGH POINT OF PIPE.

NOTE 7
INSPECTION AND TESTING SHALL BE IN ACCORDANCE WITH APPLICABLE PLUMBING CODE.

NOTE 8
NO APPARENT LEAKS UNDER NORMAL OPERATING CONDITIONS.

NOTE 9
INSPECTION AND TESTING SHALL BE IN ACCORDANCE WITH APPLICABLE NATIONAL FIRE PROTECTION ASSOCIATION STANDARDS.

NOTE 10
PIPING MATERIALS SHALL BE IN ACCORDANCE WITH NATIONAL FIRE PROTECTION ASSOCIATION STANDARDS.

NOTE 11
FOR VALVES 4" AND LARGER SEE VALVE SCHEDULE FOR SPECIAL VALVES SEE SPECIFICATIONS.

NOTE 12
CHANGE IN PIPING MATERIAL GROUP NUMBER IS INDICATED THUS: ——◆

NOTE 13
FOR FULL PIPE LINING AND COATING REQUIREMENTS, SEE SPECIFICATIONS.

NOTE 14
EXPOSED OUTDOOR PIPING SHALL BE PAINTED IN ACCORDANCE WITH SPECIFICATIONS. COLORS TO BE SELECTED BY OWNER.

NOTE 15
NATURAL GAS BURIED PIPE SHALL BE POLYETHYLENE BASED PIPE IN ACCORDANCE W/ LOCAL GAS UTILITY PIPE REQUIREMENTS FOR PRESSURE GAS SERVICE.

NOTE 16
ALL FISH RELEASE PIPE BENDS SHALL HAVE A MINIMUM RADIUS OF 5 TIMES THE PIPE DIAMETER. FITTINGS FOR FISH RELEASE PIPE SHALL BE OF THE SAME MATERIAL AS THE PIPING. ALL FISH RELEASE PIPING SHALL BE FREE OF BURRS AND ROUGH SURFACES. ALL PIPING JOINTS SHALL BE SMOOTH AND FREE OF SURFACE BLEMISHES.

NOTE 17
FOR HDPE PIPING THE SIZE OF PIPE SHOWN ON DRAWING CALL-OUTS SHALL BE THE MINIMUM INSIDE DIAMETER. PIPE WALL THICKNESS SHALL BE PER DR RATING REQUIREMENT.

GENERAL PROJECT NOTES:

1. ALL CONSTRUCTION ACTIVITIES SHALL BE PERFORMED IN COMPLIANCE WITH 1991 FISH AND WILDLIFE SERVICE (1991 AGREEMENT).
2. ALL CONSTRUCTION ACTIVITIES SHALL COMPLY WITH AWWU AND ADNR STANDARDS AND REQUIREMENTS.
3. ALL CONSTRUCTION ACTIVITIES SHALL BE PERFORMED IN COMPLIANCE WITH FEDERAL, STATE AND LOCAL STANDARDS FOR THE PROJECT.

GENERAL CIVIL NOTES:

1. EXISTING TOPOGRAPHY, STRUCTURES AND SITE FEATURES ARE SHOWN SCREENED AND/OR LIGHT-LINED. NEW FINISH GRADE, STRUCTURES, AND SITE FEATURES ARE SHOWN UNSCREENED AND HEAVY LINED.
2. VERTICAL DATUM: NAVD88, GEOID12B, US FEET.
3. HORIZONTAL DATUM: ALASKA STATE PLANE ZONE 4 NAD83(2011), US FEET.
4. ELEVATIONS GIVEN ARE TO FINISH GRADE UNLESS OTHERWISE SHOWN.
5. SLOPE UNIFORMLY BETWEEN CONTOURS AND SPOT ELEVATIONS SHOWN.

GENERAL CONSTRUCTION NOTES:

1. THE CONTRACTOR SHALL ATTEND A PRE-CONSTRUCTION CONFERENCE (OR AN ON-SITE MEETING) WITH THE PROJECT REPRESENTATIVE PRIOR TO THE START OF WORK.
2. THE CONTRACTOR SHALL NOTIFY THE PROJECT REPRESENTATIVE WHEN MATERIALS ARE ON SITE OR AN INSPECTION OF THE WORK IS REQUIRED. NO WORK MAY BEGIN ON ANY PROJECT WITHOUT TWENTY-FOUR (24) HOUR PRIOR NOTICE.
3. CONTRACTOR SHALL FURNISH PROOF THAT ALL MATERIALS INSTALLED ON THIS PROJECT MEET THE REQUIREMENTS OF THE CONTRACT DRAWINGS AND SPECIFICATIONS.
4. ANY DEVIATION FROM THE APPROVED PLANS AND SPECIFICATION MUST HAVE A DESIGN ENGINEER AND OWNER APPROVAL IN WRITING PRIOR TO CONSTRUCTION.
5. UNLESS OTHERWISE NOTED, ALL DISTURBED SURFACES SHALL BE RETURNED TO ORIGINAL OR BETTER CONDITIONS.
6. MAINTAIN, RELOCATE OR REPLACE EXISTING SURVEY MONUMENTS, CONTROL POINTS, AND STAKES WHICH ARE DISTURBED OR DESTROYED. PERFORM THE WORK TO PRODUCE THE SAME LEVEL OF ACCURACY AS THE ORIGINAL MONUMENT(S) IN A TIMELY MANNER, AND AT THE CONTRACTOR'S EXPENSE.
7. THE CONTRACTOR SHALL KEEP CONSTRUCTION ACTIVITIES WITHIN THE SITE BOUNDARIES FOR THIS PROJECT AS SHOWN. THIS INCLUDES, BUT IS NOT LIMITED TO, VEHICLES AND EQUIPMENT, STOCKPILED CUT MATERIAL, AND FILL MATERIAL UNLESS OTHERWISE APPROVED BY OWNER.
8. ALL CONTRACTORS, INCLUDING SUBCONTRACTOR WORKING WITHIN THE PROJECT BOUNDARIES ARE RESPONSIBLE FOR COMPLIANCE WITH ALL APPLICABLE SAFETY LAWS AND STANDARDS.
9. ONLY PLAN SETS STAMPED “ISSUED FOR CONSTRUCTION” SHALL BE USED BY THE PROJECT CONTRACTOR(S).
10. THE CONTRACTOR SHALL KEEP ON SITE AT ALL TIMES A COPY OF THE APPROVED CONSTRUCTION PLANS AND RECORD THE ACTUAL LOCATIONS OF THE CONSTRUCTED WORK AND ANY UTILITIES ENCOUNTERED. THE CONTRACTOR SHALL PROVIDE THESE LOCATIONS TO BE SUBMITTED TO AS PART OF THE RECORD DRAWINGS PER SPECIFICATIONS.
11. UNLESS NOTED OTHERWISE, THE CONTRACTOR(S) SHALL REMOVE ALL OBSTRUCTIONS, BOTH ABOVE AND BELOW GROUND, AS REQUIRED FOR CONSTRUCTION OF THE PROPOSED IMPROVEMENTS. THIS SHALL INCLUDE CLEARING AND GRUBBING WHICH CONSISTS OF CLEARING THE GROUND SURFACE OF ALL TREES, STUMPS, BRUSH, UNDERGROWTH, HEDGES, HEAVY GROWTH OF GRASS OR WEEDS, FENCES, STRUCTURES, DEBRIS, RUBBISH, AND SUCH MATERIAL, WHICH IN THE OPINION OF CONTRACTING OFFICER, IS UNSUITABLE FOR THE FOUNDATION OF CONSTRUCTED WORKS. ALL MATERIAL NOT SUITABLE FOR FUTURE USE ON SITE SHALL BE DISPOSED OF AT OWNER APPROVED LOCATIONS.

GENERAL EXISTING UTILITIES AND STRUCTURE NOTES:

1. EXISTING UNDERGROUND UTILITIES AND STRUCTURES WERE OBTAINED FROM AVAILABLE RECORDS. CONTRACTOR SHALL FIELD VERIFY DEPTH AND LOCATION PRIOR TO EXCAVATION. NEITHER THE OWNER NOR ENGINEER ASSUMES ANY RESPONSIBILITY FOR UTILITIES AND STRUCTURES NOT SHOWN OR NOT IN THE LOCATION SHOWN. THE CONTRACTOR SHALL VERIFY ALL LOCATIONS AND ELEVATIONS AND SHALL TAKE ALL PRECAUTIONARY MEASURES NECESSARY TO PROTECT UTILITIES OR STRUCTURES SHOWN OR NOT SHOWN.
2. THE CONTRACTOR SHALL PROTECT ALL EXISTING UTILITIES AND STRUCTURES DURING CONSTRUCTION. IF EXISTING UTILITIES (GAS, ELECTRIC, POTABLE WATER, ETC.) ARE IN CONFLICT WITH THE WORK, CONTRACTOR SHALL CONTACT THE ENGINEER.
3. PRIOR TO THE START OF CONSTRUCTION, THE CONTRACTOR SHALL LOCATE ALL EXIST UTILITIES AND STRUCTURES IN AND AROUND THE AREAS OF NEW CONSTRUCTION. THE CONTRACTOR SHALL POTHOLE FOR EXIST UTILITIES PRIOR TO SUBMITTAL OF SHOP DRAWINGS, FOR POINTS OF CONNECTIONS.
4. THE CONTRACTOR SHALL CONTACT THE UTILITY AGENCIES FOR THE FIELD LOCATION OF UTILITIES AT LEAST 72 HOURS PRIOR TO THE START OF CONSTRUCTION. A DIG ALERT IDENTIFICATION NUMBER MUST BE ISSUED BEFORE A PERMIT TO EXCAVATE WILL BE VALID.
5. THE CONTRACTOR SHALL REPAIR ALL EXISTING SURFACES, UTILITIES, BUILDINGS AND FOUNDATIONS IMPACTED BY CONSTRUCTION.

NOTES:
1. BORROW DITCHES SHALL HAVE A MINIMUM 2:1 SLOPE WITH 4:1 SLOPE RECOMMENDED. THE BACKSLOPE OF THE BORROW DITCH SHALL BE MINIMUM 2:1 BACKSLOPE WITH 4:1 BACKSLOPE RECOMMENDED. THE FLOW LINE IF THE DITCH SHALL BE 6" BELOW THE LOWEST AGGREGATE BASE COURSE TO ENCOURAGE DRAINAGE.
2. OVER EXCAVATE EXISTING GRADE 12" MIN. PROOF ROLL AND BACKFILL WITH TYPE EF PER SPECIFICATIONS.

TYPICAL GRAVEL ROAD SECTION

SCALE: NTS

C137

A. FLEXIBLE PIPE REFERS TO ALL STEEL, DUCTILE-IRON, AND PLASTIC PIPES.
B. TYPICAL TRENCH SECTIONS (I, II AND III) ARE TO BE USED ONLY WHERE STABLE, COMPACT SOIL CONDITIONS EXIST. IF BOULDERS OR LARGE OBSTRUCTIONS ARE ENCOUNTERED, TRENCH SECTIONS MAY BE DEEPER OR WIDER THAN SHOWN. THE ENGINEER SHALL BE ADVISED SHOULD THIS OCCUR.
C. THE NEED FOR PROTECTIVE SYSTEMS AND EXCAVATION SLOPES SHALL BE DETERMINED CONSIDERING APPLICABLE LOCAL, STATE AND FEDERAL (OSHA) SAFETY STANDARDS AND REGULATIONS, AND GEOTECHNICAL CONSULTANTS' RECOMMENDATIONS.
D. PROTECTIVE SYSTEMS SHALL BE DESIGNED AND BUILT IN ACCORDANCE WITH THE APPLICABLE LOCAL, STATE AND FEDERAL (OSHA) SAFETY STANDARDS AND REGULATIONS.
E. SUPPORTING DOCUMENTATION SHALL BE SUBMITTED TO THE ENGINEER REGARDING PIPE DESIGN AND COMPLIANCE WITH APPLICABLE LOCAL, STATE AND FEDERAL (OSHA) SAFETY STANDARDS.
F. UNSUPPORTED VERTICAL AND/OR SLOPING TRENCH WALL SLOPES SHALL NOT BE STEEPER THAN ALLOWED BY APPLICABLE LOCAL, STATE AND FEDERAL (OSHA) SAFETY STANDARDS AND REGULATIONS, UNLESS SUPPORTING DOCUMENTATION IS SUBMITTED, ACCORDING TO AFOREMENTIONED SAFETY STANDARDS.
G. TRENCH SECTIONS OTHER THAN THE TYPICAL SECTIONS SHOWN MAY BE UTILIZED PROVIDED THEY COMPLY WITH APPLICABLE LOCAL, STATE AND FEDERAL (OSHA) SAFETY STANDARDS AND REGULATIONS. DOCUMENTATION SUPPORTING THIS COMPLIANCE AND PIPE DESIGN CALCULATIONS SHALL BE SUBMITTED TO THE ENGINEER.
H. IF OVER-EXCAVATION DUE TO POOR FOUNDATION MATERIAL IS ORDERED BY THE ENGINEER, THE BACKFILL MATERIAL SHALL BE ACCORDING TO THE EARTHWORK SECTION OF THE SPECIFICATIONS ARTICLE ENTITLED, "FILL AND BACKFILL MATERIAL REQUIREMENTS."
I. IF DURING CONSTRUCTION, THE WATER TABLE IS DISCOVERED TO BE ABOVE THE TRENCH BOTTOM, THE ENGINEER SHALL BE NOTIFIED, AND APPROPRIATE DEWATERING SHALL BE IMPLEMENTED TO LOWER THE WATER LEVEL BELOW THE TRENCH BOTTOM. THE BACKFILL MATERIAL SHALL BE ACCORDING TO THE EARTHWORK SECTIONS OF THE SPECIFICATIONS, OR AS ORDERED BY THE ENGINEER.

NOTES:

GENERAL STRUCTURAL NOTES:
THE FOLLOWING NOTES ARE GENERAL AND APPLY TO THE ENTIRE PROJECT, UNLESS SPECIFICALLY NOTED OTHERWISE (UNO)

1) GENERAL:

A. CONSTRUCTION DOCUMENTS:
   1. THE CONTRACTOR SHALL REVIEW THE APPROVED CONTRACT DOCUMENTS AND NOTIFY THE ENGINEER OF ANY ERRORS OR DISCREPANCIES PRIOR TO THE START OF CONSTRUCTION.
   2. THE CONTRACTOR SHALL NOTIFY THE OWNER IMMEDIATELY IF ANY UNIDENTIFIED EXISTING UNDERGROUND UTILITIES ARE DISCOVERED.
   3. THE STRUCTURAL CONTRACT DRAWINGS REPRESENT THE FINISHED STRUCTURE. THEY DO NOT INDICATE THE METHOD OF CONSTRUCTION. THE CONTRACTOR SHALL PROVIDE ALL MEASURES NECESSARY TO PROTECT THE STRUCTURE DURING CONSTRUCTION. SUCH MEASURES SHALL INCLUDE, BUT ARE NOT LIMITED TO, BRACING AND/OR SHORING FOR LOADS DUE TO CONSTRUCTION EQUIPMENT, ETC.
   4. UNDER NO CIRCUMSTANCES CAN STRUCTURAL COMPONENTS BE SUBSTITUTED, OMITTED, OR ALTERED FROM THE APPROVED SET OF CONSTRUCTION DOCUMENTS WITHOUT WRITTEN APPROVAL FROM THE ENGINEER.

B. DIMENSIONS AND NOTATIONS:
   1. WRITTEN DIMENSIONS SHALL TAKE PRECEDENCE OVER SCALED DIMENSIONS. DO NOT SCALE DRAWINGS.
   2. ABBREVIATIONS USED ON THE APPROVED CONSTRUCTION DOCUMENTS SHALL BE CONSIDERED TYPICAL ABBREVIATIONS FOR THE INDUSTRY. THE CONTRACTOR SHALL BE RESPONSIBLE TO NOTIFY THE ENGINEER IMMEDIATELY OF ANY ABBREVIATIONS THAT ARE UNKNOWN TO THE CONTRACTOR.

C. TYPICAL NOTES AND DETAILS:
   1. SPECIFIC NOTES AND DETAILS SHALL TAKE PRECEDENCE OVER STANDARD TYPICAL NOTES AND DETAILS.
   2. STANDARD TYPICAL NOTES AND DETAILS ARE TO BE USED WHEN REFERRED TO OR WHEN NO OTHER MORE RESTRICTIVE OR DIFFERENT DETAILS ARE SHOWN ON THE DRAWINGS.
   3. WORK NOT PARTICULARLY SHOWN OR SPECIFIED SHALL BE THE SAME AS SIMILAR PARTS THAT ARE SHOWN OR SPECIFIED.

D. CODE REQUIREMENTS:
   1. ALL WORK SHALL CONFORM TO THE MINIMUM STANDARDS OF REGULATING AGENCIES WHICH MAY HAVE AUTHORITY OVER ANY PORTION OF THE WORK.
   2. SPECIFICATIONS, CODES AND STANDARDS NOTED SHALL BE OF THE LATEST APPROVED ISSUE, INCLUDING SUPPLEMENTS, UNLESS NOTED OTHERWISE.
   3. MINIMUM UNIFORM (BLANKET) ROOF SNOW LOAD, AS DEFINED BY LOCAL BUILDING OFFICIAL OR STATE, SHALL BE DESIGNED FOR.

2) CODES, STANDARDS, AND REFERENCES:

A. ASCE 7-16: MINIMUM DESIGN LOADS AND ASSOCIATED CRITERIA FOR BUILDINGS AND OTHER STRUCTURES
B. ACI 318-14: BUILDING CODE REQUIREMENTS FOR STRUCTURAL CONCRETE
C. ACI 350-06: CODE REQUIREMENTS FOR ENVIRONMENTAL ENGINEERING CONCRETE STRUCTURES
D. AISC 360-16 SPECIFICATION FOR STRUCTURAL STEEL BUILDINGS
E. 2018 INTERNATIONAL BUILDING CODE (IBC)

3) FOUNDATIONS AND GEOTECHNICAL:

A. GEOTECHNICAL DESIGN CRITERIA IS BASED ON THE RECOMMENDATIONS DOCUMENTED IN THE DESIGN DOCUMENTATION REPORT:

4) NON-SHRINK GROUT:
A. ALL GROUT WORK SHALL CONFORM TO THE LATEST EDITION OF ACI 301.
B. FORMWORK: DESIGN, ERECT, SUPPORT, BRACE AND MAINTAIN FORMWORK TO SUPPORT VERTICAL, LATERAL, STATIC AND DYNAMIC LOADS THAT MIGHT BE APPLIED UNTIL STRUCTURE CAN SUPPORT SUCH LOADS.

5) STRUCTURAL AND MISCELLANEOUS STEEL:

A. STRUCTURAL STEEL SHALL CONFORM TO THE FOLLOWING ASTM STANDARDS:

a)	WIDE FLANGE SHAPES	A992, GR 50 GALV
b)	OTHER SHAPES, PLATES, ANGLES AND BARS	A36 GALV
c)	STEEL PIPE	A53, GRADE B GALV
d)	HOLLOW STRUCTURAL SECTIONS	A500, GRADE B GALV

B. WELDS: PROVIDE 70KSI LOW HYDROGEN ELECTRODE OR PROCESS IN ACCORDANCE WITH AWS A5.1.
C. BOLTS, U.N.O.:
   1. STAINLESS STEEL: ASTM A193, GRADE 8, CLASS 2, AISI TYPE 316
D. DRILL AND EPOXY ANCHOR BOLTS:
   1. STAINLESS STEEL: ASTM A193, GRADE 8, CLASS 2, AISI, TYPE 316 OR EQUAL APPROVED BY ENGINEER
E. EPOXY BOLT OR EXPANSION BOLT SUBSTITUTIONS FOR EMBEDDED BOLTS IS PROHIBITED WITHOUT WRITTEN CONSENT FROM THE ENGINEER.
F. UNLESS NOTED OTHERWISE ON THE DRAWINGS, ALL EPOXY BOLTS SHALL BE AS SPECIFIED.
G. ALL STRUCTURAL STEEL SHALL BE DETAILED, FABRICATED, AND ERECTED IN ACCORDANCE WITH THE AISC CODE OF STANDARD PRACTICE, EXCEPT AS MODIFIED IN THESE NOTES AND THE PROJECT SPECIFICATIONS.

6) ROUGH CARPENTRY:

A. STANDARDS AND REFERENCES

ROUGH CARPENTRY CONSTRUCTION SHALL COMPLY WITH THE FOLLOWING IN ADDITION TO THE STANDARDS AND REFERENCES LISTED IN GENERAL NOTE 2:

NDS	ANSI/AWC - NATIONAL DESIGN SPECIFICATION FOR WOOD CONSTRUCTION, 2015 EDITION
SDPWS	ANSI/AWC - SPECIAL DESIGN PROVISIONS FOR WIND AND SEISMIC, 2015 EDITION

B. MATERIALS

1. LUMBER GRADE – STRUCTURAL FRAMING LUMBER SHALL BE DOUGLAS FIR -LARCH, NO. 2 OR BETTER UNLESS OTHERWISE INDICATED. REFER TO ARCH FOR TIMBER SIDING MATERIAL SPECIFICATION.

2. MOISTURE CONTENT - STRUCTURAL WOOD MEMBERS SHALL HAVE A MAXIMUM MOISTURE CONTENT OF 19 PERCENT AND NOT LESS THAN ONE PERCENT.

3. PRESERVATIVE TREATMENT – WOOD SHALL BE PRESERVATIVE TREATED IN ACCORDANCE WITH AWPA STANDARD U1 AND M4 FOR THE SPECIES, PRODUCT, PRESERVATIVE AND END USE. PRESERVATIVE TREATED WOOD SHALL BE MARKED PER IBC SECTION 2303.1.9.1.

4. CONNECTORS AND FASTENERS – WOOD CONSTRUCTION CONNECTORS AND FASTENERS SHALL BE GALVANIZED.

Appendix B. Class 4 Opinion of Probable Construction Costs

This page intentionally left blank.

Technical Memorandum			
To:	Mike Brodie, P.E. Chugach Electric Association	Project:	Eklutna Fish & Wildlife Project
From:	Sean P. Ellenson, P.E. McMillen, Inc	cc:	Curtis Neibaur McMillen, Inc
Prepared by:	Paul Rader McMillen, Inc	Job No.:	22-028
Date:	October 6, 2023		
Subject:	Class 4 Opinion of Probable Construction Costs – AWWU Maintenance Road and Bridges		

Revision Log

Revision No.	Date	Revision Description
0	October 6, 2023	Initial Draft

1.0 Introduction

1.1 Purpose

This technical memorandum (TM) presents a summary of the Opinion of Probable Construction Costs (OPCC) for the AWWU Maintenance Road and Bridges as part of the Eklutna Fish & Wildlife Project. The OPCC estimates are based on the 15% Design drawing package dated October 6, 2023.

1.2 Background

The Eklutna Hydroelectric Project (Project) is located in Southcentral Alaska approximately 30 miles northeast of downtown Anchorage near the Native Village of Eklutna (NVE). The Project was originally constructed by the Federal government in the 1950s but was later sold to, and is currently owned by, the Municipality of Anchorage (MOA), Chugach Electric Association, Inc. (Chugach), and the Matanuska Electric Association (MEA), collectively the “Project Owners”. As part of the sale of the Project, the current Project Owners entered into the 1991 Fish and Wildlife Agreement (1991 Agreement) with the National Marine Fisheries Service (NMFS), U.S. Fish and Wildlife Service (USFWS), and the State of Alaska (the Parties). The 1991 Agreement requires the Project Owners to develop and propose to the Governor of Alaska (Governor) a program to protect, mitigate damages to, and enhance fish and wildlife impacted by the development of the Project.

In development of the program, the Project Owners have met with various stakeholders to identify protection, mitigation, and enhancement measures that may be implemented within the Project study area. These measures were incorporated into a Phase 1 Engineering Feasibility Study which advanced the preliminary design, estimated capital expenditures, and determined operations and maintenance costs for each alternative for the purposes of evaluation. Selected measures from the Phase 1 Engineering Feasibility Study have been advanced to a Phase 2 Engineering Feasibility Study which includes a 15% level of design and a Class 4 OPCC.

1.3 Estimation Preparation

McMillen has utilized historical cost data from similarly technical projects which we have designed or constructed as a self-performing general contractor, as the basis of our Class 4 OPCC estimate. Appropriate overhead and profit markups have been included below the subtotal to account for the competitive bidders' markups, they are likely to apply on their bid prices. A 20% contingency has been included at this stage to account for details and minor project features which are not yet included in the project documents at the 15% Design level of detail. The contingency value may be reduced in future versions of the OPCC estimate, as the project design is advanced.

General requirement and mobilization costs are estimated at 12% and 8% of construction activity costs based on historical project ranges. Overhead and profit markups have been included at 10% and 5% respectively of direct construction costs. The estimate is in 2023 dollars. No escalation is included in the pricing. This OPCC estimate is consistent with a Class 4 estimate as defined by the AACE classification system, as shown in Figure 1-1 and 1-2. For the purposes of this project, McMillen has utilized the accuracy range of -30% to +50%.

CLASS 4 ESTIMATE	
Description: Class 4 estimates are generally prepared based on limited information and subsequently have fairly wide accuracy ranges. They are typically used for project screening, determination of feasibility, concept evaluation, and preliminary budget approval. Typically, engineering is from 1% to 15% complete, and would comprise at a minimum the following: plant capacity, block schematics, indicated layout, process flow diagrams (PFDs) for main process systems, and preliminary engineered process and utility equipment lists. **Level of Project Definition Required:** 1% to 15% of full project definition. **End Usage:** Class 4 estimates are prepared for a number of purposes, such as but not limited to, detailed strategic planning, business development, project screening at more developed stages, alternative scheme analysis, confirmation of economic and/or technical feasibility, and preliminary budget approval or approval to proceed to next stage.	**Estimating Methods Used:** Class 4 estimates virtually always use stochastic estimating methods such as equipment factors, Lang factors, Hand factors, Chilton factors, Peters-Timmerhaus factors, Guthrie factors, the Miller method, gross unit costs/ratios, and other parametric and modeling techniques. **Expected Accuracy Range:** Typical accuracy ranges for Class 4 estimates are -15% to -30% on the low side, and +20% to +50% on the high side, depending on the technological complexity of the project, appropriate reference information, and the inclusion of an appropriate contingency determination. Ranges could exceed those shown in unusual circumstances. **Effort to Prepare (for US$20MM project):** Typically, as little as 20 hours or less to perhaps more than 300 hours, depending on the project and the estimating methodology used. **ANSI Standard Reference Z94.2-1989 Name:** Budget estimate (typically -15% to + 30%). **Alternate Estimate Names, Terms, Expressions, Synonyms:** Screening, top-down, feasibility, authorization, factored, pre-design, pre-study.

Figure 1-1: Class 4 Estimate Description

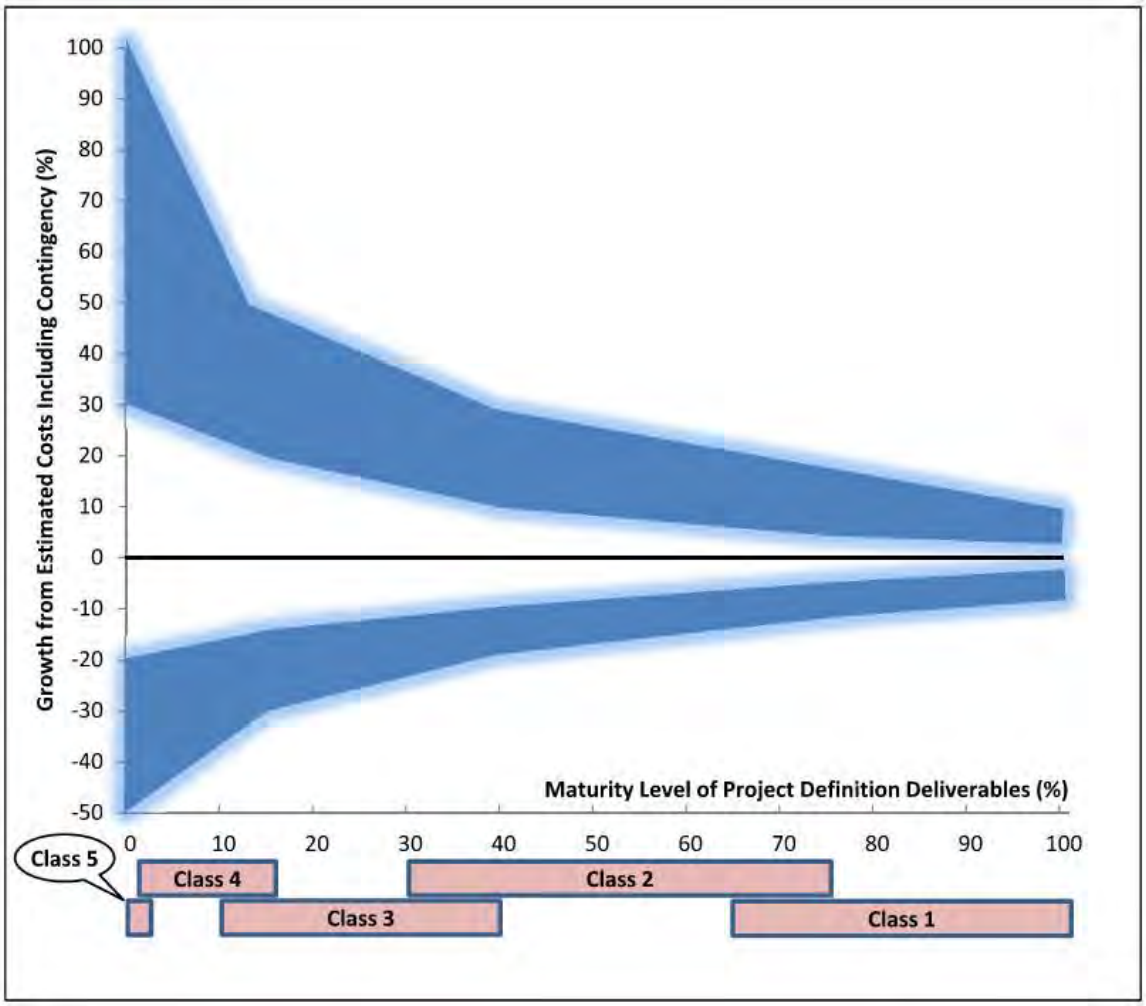

Figure 1-2: Variable in Accuracy Ranges (AACE 69R-12)

2.0 Project Cost Estimate

This OPCC estimate is consistent with a Class 4 estimate as defined by the Association for the Advancement of Cost Engineering (AACE) standard practice 69R-12. The maturity level of the project definition warrants a wide range of potential growth as the project design progresses. The Eklutna feasibility OPCC is based on 15% Design Drawings.

2.1 Cost Assumptions and Qualifications

The cost estimate was primarily developed utilizing costs from past projects and estimates. Below is a summary of the cost basis including any assumptions necessary for cost estimating purposes at this stage of design.

Common Cost Basis:

- General requirement and mobilization costs are based on a typical percentage of total direct construction costs: 12% and 8% respectively.
- Overhead & profit are added to direct construction costs at 10% and 5% respectively.
- A 20% contingency is added to the costs which is a typical contingency at the early concept phase of a project.
- Site access and laydown areas were all based on a unit price of $160k per acre for 0.3 acres.
- Excavation spoils can be disposed of nearby the location of excavation or re-used as fill material for the new bridge approaches.

Phase 2 Engineering
AWWU Maintenance Road and Bridges

Line Item	Item	Quantity	Unit	Unit Cost	Total Cost	Total
01	**DIVISION 01 INDIRECTS**					**$543,718**

AACE International CLASS 4 Cost Estimate - Class 4 estimates are generally prepared based on limited information and subsequently have fairly wide accuracy ranges. They are typically prepared for a number of purposes, such as but not limited to, detailed strategic planning, business case development, project screening at more developed stages, alternative scheme analysis, confirmation of economic and/or technical feasibility, selection of a feasible alternative and preliminary budget approval to proceed to next stage of the project (definition phase). Typically, engineering is from 1% to 15% complete, and would comprise at a minimum the following: Feasibility design for several alternative layouts to include design criteria, generation capacity, feasibility level drawings, preliminary one-line diagrams, and comprehensive user requirements. Class 4 estimates generally use stochastic estimating methods such as cost/capacity graphs or curves and factors, historical data and other parametric and modeling techniques. Typical accuracy ranges for Class 4 estimates are -15% to -30% on the low side, and +20% to +50% on the high side, depending on the technological complexity of the project, appropriate reference information, and other risks (after inclusion of an appropriate contingency determination). Ranges could exceed those shown if there are unusual risks.

1.0 Introduction

1.1 Purpose

The purpose of this report is to present the design documentation associated with the development of the Dam Outlet Modifications as part of the Eklutna Fish & Wildlife Program (Project). The design documentation report (DDR) summarizes the pertinent data, design criteria, and standards used as the basis for the 15% level of design of the Project. The DDR documents the data, criteria, and standards by engineering discipline, and provides information about the operation of the design components associated with the Project.

The information presented within this DDR will be updated throughout the design development process to reflect refinement of the Project components and facilities, and advancement of the design analysis and details.

1.2 Location

The Project site is located in Southcentral Alaska approximately 30 miles northeast of downtown Anchorage near the Native Village of Eklutna. The Project footprint spans lands owned and managed by the State of Alaska, Eklutna Inc., and the Bureau of Land Management. As proposed, the Project involves modifying the outlet gate within Eklutna Dam and adding additional instrumentation to the structure to allow for remote operation and control of the outletworks. The location of Eklutna Dam and it's vicinity to other features of the overall project is presented in Figure 1-1.

1.3 Background and Objectives

As part of the Eklutna Fish & Wildlife Program, Chugach Electric Association, Matanuska Electric Association, and the Municipality of Anchorage, known collectively as the Owners of the Eklutna Hydroelectric Project (Owners) are studying various means of providing water to the Eklutna River to mitigate damages to, and enhance fish and wildlife impacted by development and continuing operation of the Project. The measure proposed to provide periodic channel maintenance flows to the river includes modifications to the existing outletworks within Eklutna Dam. The purpose of this report is to document the design criteria and analyses performed for the engineering development of the dam outlet modifications.

1.4 Report Organization

This DDR is a record of the design effort for the Project and specifically describes the details of the design process and work effort for the Dam Outlet Modifications. The DDR consists of a

summary of the design elements, criteria, methods and approach, engineering calculations, and pertinent references. The major report sections and intended purpose are presented in Table 1-1.

Table 1-1. Major Report Sections and Purpose.

Section	Description	Purpose
1	Introduction and Background	Presents the Project background, purpose, location, authorization, objectives, feature scope, and the report organization.
2	General Description	Summarizes the basic design criteria that are used as the basis of design.
3	Existing Infrastructure	Summarizes the existing infrastructure related to the Project.
4	Project Infrastructure and Operation	Describes the proposed modifications for the Eklutna Dam outlet structure.
5	Structural Design	Includes information related to the structural design of the proposed access platform at Eklutna Dam.
6	Mechanical Design	Includes information related to the mechanical design of the outlet gate actuator.
7	Electrical and Instrumentation / Control Design	Includes information related to the electrical design and instrumentation and controls associated with the Eklutna Dam outlet structure modifications.
8	References	Documents the references used in developing the design.
Appendices		
A	15% Design Drawings	Presents the 15% design drawings for the Eklutna Dam Outlet Modifications
B	Class 4 OPCC	Presents the Class 4 Opinion of Probable Construction Costs for the Eklutna Dam Outlet Modifications.

2.0 General Description

2.1 General Design Criteria and Standards

General design criteria and standards for the Project include the abbreviations, survey datum, topographic mapping, references, and design standards as described below.

2.1.1 Standard List of Terms and Abbreviations

AACE	Association for Advancement of Cost Engineering
AC	alternating current
ACI	American Concrete Institute
AF	acre-ft
AISC	American Institute of Steel Construction
ANSI	American National Standards Institute
ASTM	American Society of Testing and Materials
AWWA	American Water Works Association
AWWU	Anchorage Water and Wastewater Utility
BMP	Best Management Practice
CADD	computer aided design and drafting
CEA	Chugach Electric Association
cfm	cubic feet per minute
cfs	cubic feet per second
DC	direct current
DDR	Design Documentation Report
ERRV	Eklutna River Release Valve
El.	elevation
fps	feet per second
ft	feet
HDC	Hydraulic Design Criteria
HEC	Hydrologic Engineering Center
HMI	human-machine interface
HPU	hydraulic power unit

HVAC	heating, ventilation, and air conditioning
Hz	hertz
IESNA	Illuminating Engineering Society of North America
I/O	Input/Output
IBC	International Building Code
IEEE	Institute of Electrical and Electronics Engineers
LED	light-emitting diode
LiDAR	Light Detection and Ranging
MEA	Matanuska Electric Association
MGD	million gallons per day
MOA	Municipality of Anchorage
MSL	Mean Sea Level
NAD83	North American Datum of 1983
NAVD88	North American Vertical Datum of 1988
NEC	National Electric Code
NEMA	National Electrical Manufacturers Association
NESC	National Electrical Safety Code
NFPA	National Fire Protection Association
NGVD29	National Geodetic Vertical Datum of 1929
NVE	Native Village of Eklutna
O&M	operation and maintenance
pcf	pounds per cubic foot
PLC	programmable logic controller
psi	pounds per square-inch
RTD	Resistance Temperature Detector
SCADA	Supervisory Control and Data Acquisition
UL	Underwriters Laboratories
UPS	uninterruptible power supply
USGS	U.S. Geological Survey
V	volt

2.2 Survey Datum

Multiple vertical survey datums are reported in and around the main features of the Project. The following datums are identified within the Project area:

1. The MOA conducted LiDAR survey flights over the Project Area between May 12-30, 2015. The vertical datum this data is presented in is NGVD 1929 – M.O.A. 1972 Adjustment (MOA72).

2. McMillen contracted NV5 Geospatial to conduct LiDAR survey flights over the Project Area on May 28, 2020 and on May 18, 2022. The vertical datum this data is presented in is NAVD88, GEOID12B.

3. The As-Built Drawings for the intake structure are used for the reservoir modeling and hydraulic analysis. The drawings are titled “Eklutna Project – Alaska; Rehabilitation Pressure Tunnel” dated November 16, 1964 (USBR, Eklutna Project - Alaska. Rehabilitation Pressure Tunnel. As Built Drawings 1964). The vertical datum for these drawings is currently unknown and shall be referred to as “Local Datum” until further information is gathered.

4. The As-Built drawings of the AWWU lake diversion tunnel and pipeline are utilized as part of the design of the proposed facility. The drawings are titled “Eklutna Water Project” dated January 2, 1986 (AWWU 1986). The vertical datum used in these drawings is the GAAB Post-Quake, USC&GS, MSL, 1972. As currently understood this datum is identical to and used interchangeably with MOA72.

5. The USGS gauge station 15278000 Eklutna Lk Nr Palmer AK is reported by USGS to be based on the NGVD29. Discussions with USGS revealed that this is not necessarily the case, rather the gauge is tied to a brass cap set on the Eklutna Dam spillway wall.

The survey datum that will be utilized as the basis of this Project and the basis of all elevations within this report is NAVD88 GEOID 12B in terms of elevation with respect to Mean Sea level (MSL), US Foot. A conversion was determined from each of the unique project datums to correct to NAVD88 for the purposes of this investigation (McMillen 2022). The calculated correction factors between vertical datums used as part of the Eklutna Project is presented in Table 2-1.

Table 2-1. Eklutna Vertical Datum Conversion.

Vertical Datum	Conversion to NAVD88 (ft)	Notes
NAVD88	+0.00	
USGS Gauge	+3.263	Based on Staff Gauge Measurements at Dam
Local Datum	+3.593	Based on 2003 Survey at Dam
MOA72	+6.339	Based on 1987 Survey at Dam
	+6.520	Based on 2015 MOA LiDAR report

3.0 Existing Infrastructure

3.1 Eklutna Dam

The existing dam is located approximately 1,400 feet downstream of the natural outlet of Eklutna Lake. It is an earth and rock fill embankment dam with a crest length of 815 feet, a crest width of 30 feet, and a crest elevation (El.) of 894.6 feet (NAVD88) (USBR 1967). The crest of the dam is finished with crushed rock material to form a stable road surface, as shown in Figure 3-1. An ungated overflow spillway is incorporated within the middle of the dam. The spillway crest is El. 871 feet and the crest length is 18 feet. The dam allows for storage of water in Eklutna Lake for use throughout the year for power generation.

Figure 3-1. Dam Crest and Ungated Overflow Spillway, Looking North.

There is a natural glacial moraine at the outlet of Eklutna. When the lake level is below the crest of the moraine (El. 863.6 feet), a pond is created between the moraine and the current dam, as shown in Figure 3-2. The water level in the pond is not monitored; however, the pond level can differ from the lake level by up to 30 feet in an average year, when the lake level is drawn down below the crest of the moraine. A small tributary entering the pond approximately 400-ft upstream of the dam keeps the water level steady in the pond when the lake is disconnected from the dam, with a small outflow leaving the pond and entering Eklutna Lake.

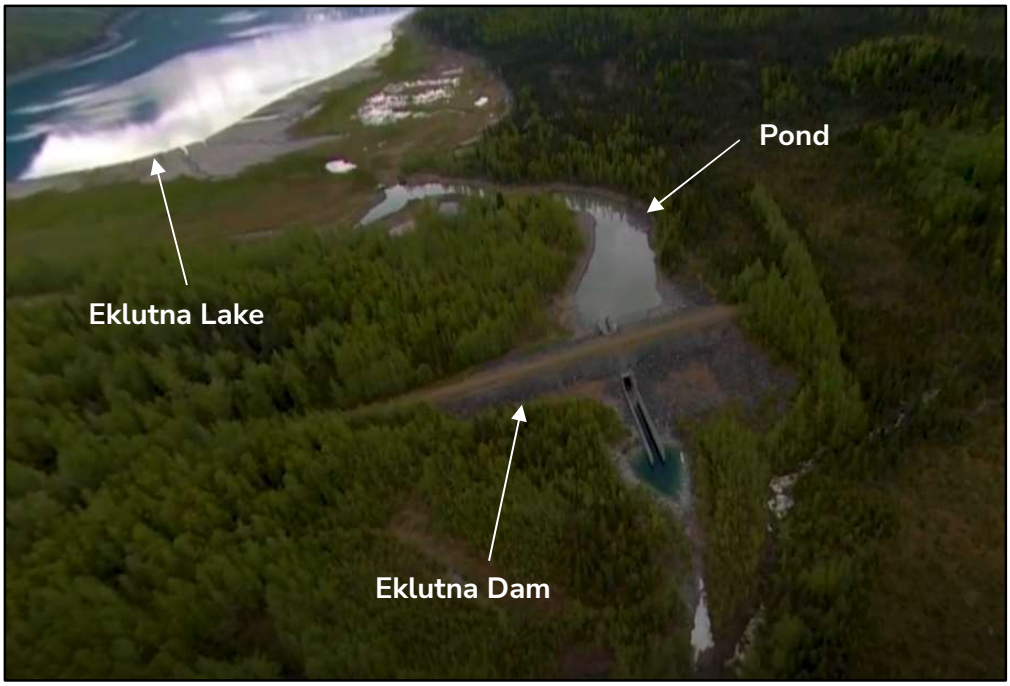

Figure 3-2. Pond between the Natural Glacial Moraine and Eklutna Dam; May 2020.

There is a 30-inch by 30-inch manually actuated outlet gate located at the base of the spillway crest with an invert elevation of El. 855.6 feet. The gate is manually actuated via a pedestal actuator with lever located within a gallery within the dam spillway accessible via ladder from the crest at a floor elevation of El. 861.6 ft. The original intent of this outlet was to drain the pond when water becomes trapped there during late fall or early winter; however, it has the ability to make continuous flow releases into Eklutna River when Eklutna Lake is at or above El. 864.6 ft. The original cast iron gate was replaced in 2021 with a stainless-steel gate to allow for study flow releases that same year. Figure 3-3 provides images of the intake, gate actuator and upstream face of the new outlet gate.

Figure 3-3. Outlet Gate Intake (Left). Gate Operator (Center). Face of Outlet Gate (Right).

The maximum capacity of the drainage outlet gate is 190 cfs when the lake is at a maximum pool elevation of 874.6 ft. Figure 3-4 presents the stage-discharge relationship of the gate at varying opening percentages.

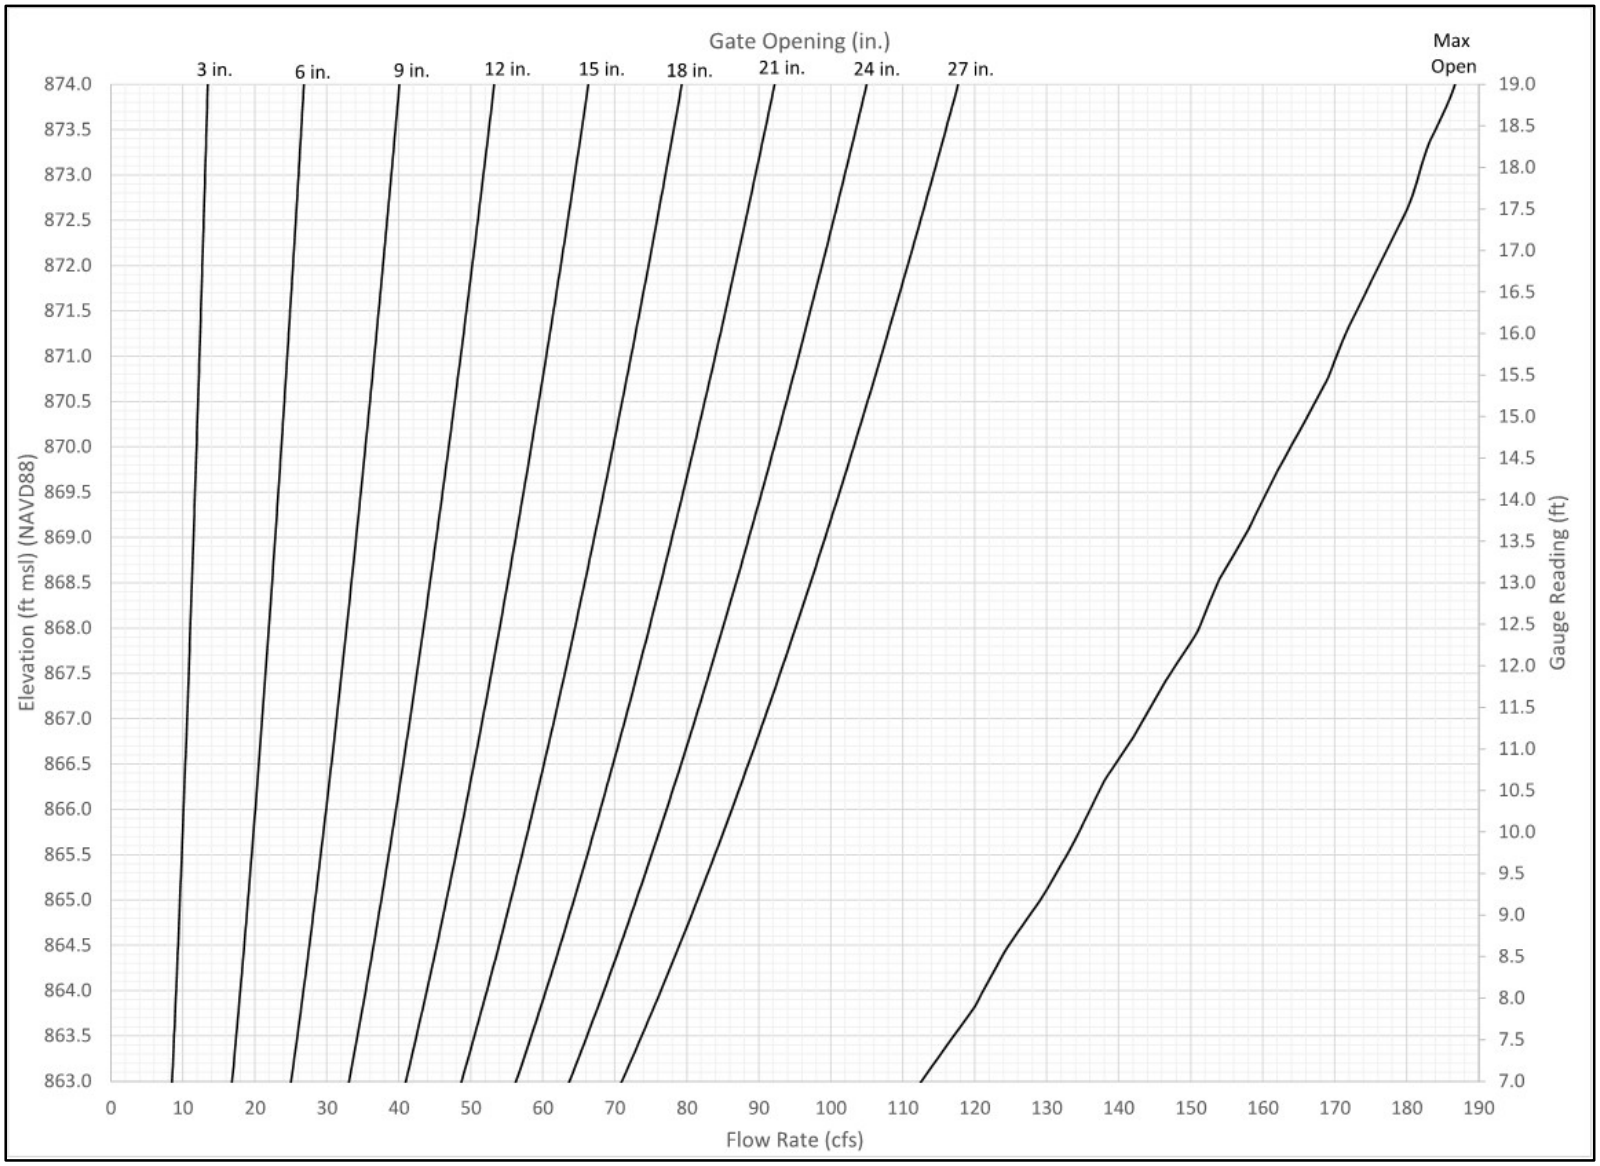

Figure 3-4. Eklutna Dam Outlet Gate Stage-Discharge Relationship.

4.0 Project Infrastructure and Operation

4.1 Proposed Channel Maintenance Flow Regime

The proposed channel maintenance flow regime has a peak flow of 220 cfs with an overall shaped release occurring approximately 72 hours in three out of every 10 years in order to take advantage of wet water years. The channel maintenance flow regime may be provided by natural high flow events or spill events. In the absence of any natural high flow events or spill events, flow releases to meet the channel maintenance flow regime will be made. It shall be noted that for this channel maintenance flow to occur, operations of the reservoir may need to change to raise the water surface high enough achieve the desired flow rate.

Based on geomorphic and fisheries studies and modeling, the proposal for the channel maintenance flow is a shaped hydrograph to more closely resemble a natural peak flow as shown in Table 4-1 and Figure 4-1. The timing of channel maintenance flows will be during the fall when Eklutna Lake levels are highest and take into consideration limitations of inflow volumes and allowance for continuing year-round hydropower operations.

Table 4-1. Proposed Channel Maintenance Regime Flow Rate and Duration.

Flow Duration (hours)	Flow Rate (cfs)
3	150
3	200
36	220
12	200
6	160
6	140
6	110
6	90
6	80
6	70
4	60

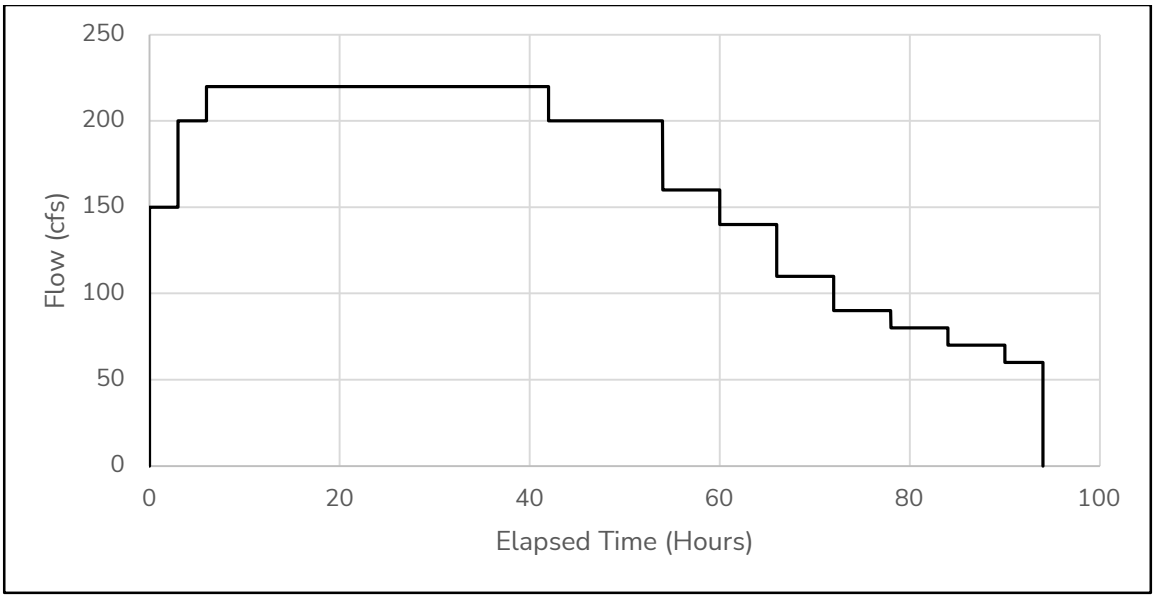

Figure 4-1. Channel Maintenance Flow Hydrograph.

The channel maintenance flow is intended to be released through a combination of the proposed Eklutna River Release Facility (ERRF) located near the AWWU portal valve and through the modified dam outletworks. The ERRF has a maximum flow capacity of 80 cfs, requiring a minimum of 140 cfs to be released through the dam outletworks to achieve the desired channel maintenance peak flow. Higher flow rates may be released through the modified outletworks up to a maximum of 190 cfs dependent on the water surface elevation within the lake during the channel maintenance flow period.

4.2 Eklutna Dam Outlet Gate Actuator

The existing outlet gate is operated via a 15" hand crank located on a pedestal support within the Eklutna Dam spillway gate gallery, as presented in Figure 4-2. This manual hand crank actuator is proposed to be removed and replaced with a Limitorque multi-turn electric motor actuator with integral position sensing or engineer approved equivalent.

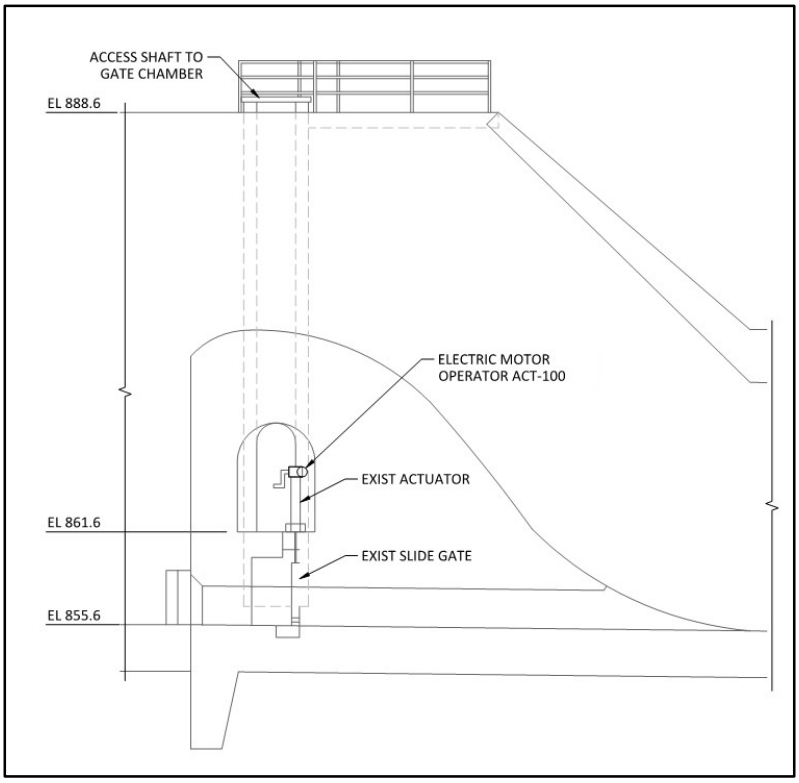

Figure 4-2. Eklutna Dam Gate Gallery Profile.

4.3 Eklutna Lake Level Transducer

To provide accurate monitoring of flow released through the dam outlet gate during a channel maintenance flow event, the rating curve tied to the design of the outlet gate shall be utilized, as presented in Figure 3-4. The gate position will be monitored remotely via the new position feedback sensor within the electric motor operator of the gate. To monitor the water surface elevation of the reservoir, a new stilling well and pressure transducer will be located upstream of the gate within the entrance to the Eklutna Dam spillway channel. The addition of this transducer will avoid any potential inaccuracies with utilizing the existing USGS gauge near the Project power intake to measure water surface elevation near the spillway channel entrance. The flow measurement at the gate is anticipated to have an accuracy of ±2%.

To access the new stilling well and level transducer, a grating platform will be constructed along the left training wall of the spillway immediately adjacent to the walkway to access the outlet gate access hatch. The platform will have a width of approximately 3feet and a length of approximately 25 feet. The plan and profile of the stilling well and access platform is presented in Figure 4-3.

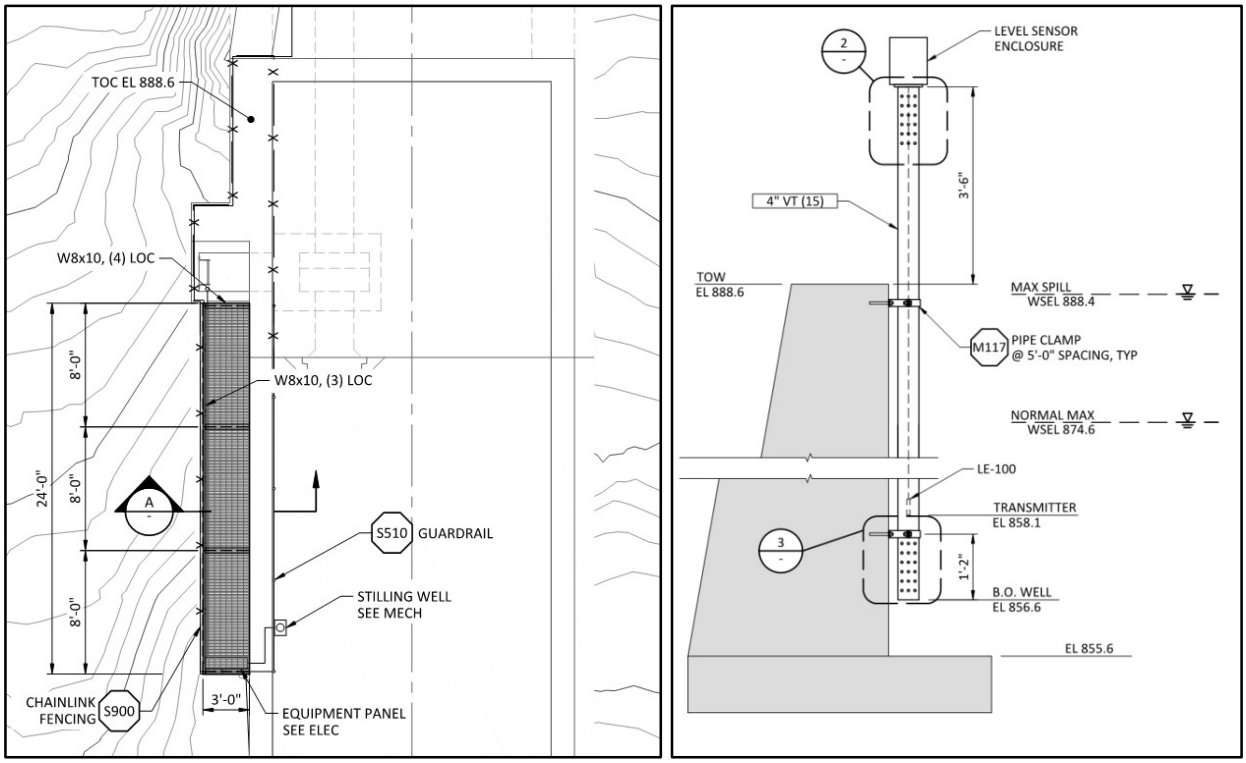

Figure 4-3. Stilling Well Access Platform Plan and Profile.

5.0 Structural Design Criteria

The structural design criteria apply to all design procedures to be implemented during the Project design. Structural design considerations listed in this section include material selection and design requirements that are intended to be incorporated into the Project.

5.1 Applicable Codes and Standards

The structural design of the access platform will conform to the following reports, criteria, and industry codes and standards. The applicable version of each document is the latest edition in force unless noted otherwise. References to the specific codes and standards will be included in the applicable technical specifications as the final design documents are prepared.

Table 5-1. Structural Codes and Standards.

Number	Description
Building Code	
ASCE 7	ASCE 7/SEI 7-16 Minimum Design Loads for Buildings and Other Structures, 2016
Design Standards and References	
ACI 318	Building Code Requirements for Structural Concrete, 2014
AISC 360	Specification for Structural Steel Buildings, 2016
ASIC SCM	Steel Construction Manual, 14th Edition
AWS D1.1	Structural Steel Welding Code – Steel

5.2 Materials

Materials and standards for concrete, concrete-related materials, structural steel, and miscellaneous metals for the Project are indicated in Table 5-2.

Table 5-2. Structural Materials and Design Standards.

Component	Material and Standard
Concrete and Related	
Existing Concrete	Compressive Strength (static), f'ce = 3000 psi
Adhesive Anchors	Two component epoxy, ASTM C-881 (with SS threaded anchor rod or reinforcing dowels)

Component	Material and Standard
Structural Steel	
Wide Flange Shapes	ASTM A992, Grade 50ksi
M, C, L shapes	ASTM A572, Grade 50ksi
Tube (HSS)	ASTM A500, Grade C. (46ksi Round / 50ksi Rect.)
Plates and Bars	ASTM A572, Grade 50ksi
High-Strength Bolts	ASTM F3125, Grade A325
Anchor Rods	ASTM F1554, Grade 50ksi (threaded) A193, Type 316 Stainless Steel
Miscellaneous Metals	
Guardrail and Grating	Galvanized steel

5.3 Design Loads

The general load types considered in the design of the structure are summarized in Table 5-3.

Table 5-3. Structural Design Loads.

Load Type	Description
Dead	Self-weight of all permanent structural elements as well as super-imposed weight of permanent mechanical and electrical equipment and piping.
Live	Temporary loads produced by the use and occupancy of the building or structure (excluding environmental loads). This load type includes those produced by movable objects and loads on guardrails, fixed ladders, and handrail systems by maintenance personnel.
Wind	Wind loads will be applied to all solid surfaces of the access platform and framing.
Seismic	Inertial forces produced by ground motion during a seismic event. The effects of this load type will be approximated based on the provisions of ASCE7.

5.3.1 Design Basis for Access Platform

Design of the access platform framing, guardrail, and connections will satisfy Load Factor and Resistance Design (LRFD) methodology by providing the required strength defined by the equation below:

$$U = \sum \gamma_i L_{ni} \leq \phi R_n$$

Where:

- $U =$ required strength
- $\gamma_i =$ load factors per ASCE 7
- $L_{ni} =$ load effects per structural calculations
- $\emptyset =$ resistance factor from ASCE 7
- $R_n =$ nominal resistance from ASCE 7

This methodology will be applied to the design of other material types in accordance with the relevant design standards and references. Refer to the structural calculations for additional information and derivation of these equation variables for specific Project features and components.

6.0 Mechanical Design Criteria

The mechanical design criteria apply to all design procedures to be implemented during the Project design. Mechanical design considerations listed in this section include detailing of mechanical components, material selection, and design requirements that are intended to be incorporated into the Project.

6.1 Applicable Codes and Standards

The mechanical design will conform to the following reports, criteria, and industry codes and standards. The applicable version of each document is the latest edition in force unless noted otherwise. References to the specific codes and standards will be included in the applicable technical specifications as the final design documents are prepared.

Table 6-1. Mechanical Codes and Standards.

6.2 Materials

Materials and standards for the mechanical components of the Project are indicated in Table 6-2.

Table 6-2. Mechanical Materials and Design Standards.

Component	Material and Standard
Stilling Well	ASTM A312 Type 316 Stainless Steel - Schedule 10s

7.0 Electrical Design

The electrical design criteria apply to all design procedures implemented during the Project design. Electrical design considerations listed in this section include detailing of electrical components, material selection, and design requirements that are intended to be incorporated into the Project.

7.1 Applicable Codes and Standards

Applicable codes and standards are listed in Table 7-1.

Table 7-1. Electrical Codes and Standards

Standby Generators	NEMA MG 1, UL 142, UL 508, UL 1236, UL 2200
Transfer Switches	NEMA ICS 2, UL 1008
Grounding and Bonding Equipment	UL 467

NEMA – National Electrical Manufacturers Association

7.3 Design Loads

7.4 Power Distribution

The outlet gate actuator will be served from a 240V panelboard. A surge protective device will be provided at 240V and 120V to protect the system from transient surges. Power will be provided to the dam via buried 7,200V cable from the nearest transmission line located approximately 2,500 feet north of the site. A 7,200V / 240VAC single phase stepdown transformer will be located at the right abutment of the dam.

7.5 Process Instrumentation and Control

A SCADA system will be implemented to supervise and control the Eklutna Dam outlet gate and to monitor water surface elevation within Eklutna Lake using the proposed level transducer. The SCADA system will consist of a metal backplane in a local control panel with components mounted to it. This includes PLC and I/O modules, UPS, control power supply and distribution block, control relays, terminal blocks, overcurrent protection, digital communication hardware, and other required appurtenances. It is presumed that datalogging will be performed on the Eklutna Power Plant SCADA system. If autonomous and more continuous datalogging is determined to be required, a datalogging-capable HMI will be specified in addition to the above components.

A fiber optic communication network will be implemented between all systems of the Project via a fiber optic infrastructure. The dam outlet gate and level transducer will connect to a fiber optic communication network between Eklutna Dam, the Eklutna River Release Facility, and the Eklutna Power Plant. Digital communication protocol will be Ethernet/IP over single-mode fiber optic cable (OS2). All new segments of installation will consist of fiber optic cable that will be all-dielectric, loose-tube buffered, with water-repellant gel-fill and jacket rated for direct-bury. For adequate spares to mitigate strand failure, 24-strand cable is proposed. The

cable will be installed in HDPE SDR-11 smooth wall conduit. The fiber optic line will be brought to the LCP housed fiber connector housing for termination, then patched to the managed Ethernet switch in a loop configuration. All strands of all fiber optic cables shall be terminated and certified to the OTDR and OLTS tests. The Ethernet switch will connect the PLC to the communication system.

Field instrumentation consists of the following, as provided in Table 7-3.

Table 7-3. Field Instrumentation

Instrument Tag ISA)	Instrument Type	Parameters	Control Loop
LE-100	Pressure Transducer	Water Level Monitoring, 0-30 ft H_20 range	Measure Water Level in Stilling Well within Eklutna Dam Spillway
ACT-100	Electric Motor Actuator	Gate Position	Measure Status of Actuator and Position of Outlet Gate Leaf

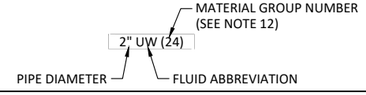
FLUID ABBREVIATION	FUNCTION	ALLOWABLE PIPING MATERIAL GROUP NO. (SEE NOTE 1 AND 4)				FIELD TEST REQUIREMENTS (SEE NOTE 3 AND NOTE 4)		
	THIS LIST MAY INCLUDE FLUIDS NOT USED IN THIS PROJECT	EXPOSED PIPING (SEE NOTE 14)		BURIED PIPING (SEE NOTE 13)		MINIMUM TEST PRESSURE PSI	TEST MEDIUM	LEAKAGE ALLOWANCE (SEE NOTE 2)
		3" DIA AND SMALLER	4" DIA AND LARGER	3" DIA AND SMALLER	4" DIA AND LARGER			
COMMONLY USED FUNCTIONS								
VT	VENT	15	15	--	--	15 IN Hg	VACUUM	(A) (D)

PIPING MATERIAL SCHEDULE (SEE NOTE 1)

GROUP NO.	PIPE MATERIAL	FITTINGS / JOINTS	LININGS AND COATINGS (SEE NOTE 13)
15	STAINLESS STEEL, TYPE 316, ASTM A312, SCHEDULE 10S.	STAINLESS STEEL, TYPE 316 WELDED SLIP-ON FLG ASME B16.3, OR SOCKET WELDED FITTINGS SCHEDULE 40S, (NO THREADED JOINTS ALLOWED)	NOT APPLICABLE

TYPICAL PIPE DESIGNATION:



NOTES:

NOTE 1
ALTHOUGH SEVERAL PIPE MATERIAL GROUPS MAY BE LISTED ON THIS SHEET FOR A GIVEN FLUID SERVICE, CONTRACTOR SHALL PROVIDE ONLY THE PIPE MATERIAL GROUP SHOWN ON THE DRAWINGS AND SPECIFIED FOR THAT FLUID SERVICE.

NOTE 2
LEAKAGE ALLOWANCE IS AS FOLLOWS
A. PIPES SO DESIGNATED SHALL SHOW ZERO LEAKAGE.
B. PIPES SO DESIGNATED SHALL SHOW ZERO LEAKAGE FOR UNBURIED PIPE AND NOT MORE THAN 0.02 GALLON PER HOUR PER INCH DIAMETER PER 100 FEET OF BURIED PIPE.
C. PIPES SO DESIGNATED SHALL NOT SHOW A LEAKAGE OF MORE THAN 0.15 GALLON PER HOUR PER INCH OF DIAMETER PER 100 FEET OF PIPE.
D. PIPES SO DESIGNATED SHALL NOT SHOW A LOSS OF PRESSURE OF MORE THAN 5 PERCENT.
E. PIPE SO DESIGNATED SHALL NOT SHOW A LOSS OF VACUUM OF MORE THAN 4 INCHES MERCURY COLUMN.

NOTE 3
FOR FIELD TEST PROCEDURES AND ADDITIONAL TEST REQUIREMENTS, SEE PIPING SECTION OF SPECIFICATIONS.

NOTE 4
NO SUBSTITUTIONS U.N.O. IN THE SPECIFICATIONS.

NOTE 5
NOT USED

NOTE 6
STATIC WATER TEST WITH SURFACE 5 FEET ABOVE HIGH POINT OF PIPE.

NOTE 7
INSPECTION AND TESTING SHALL BE IN ACCORDANCE WITH APPLICABLE PLUMBING CODE.

NOTE 8

GENERAL STRUCTURAL NOTES:
THE FOLLOWING NOTES ARE GENERAL AND APPLY TO THE ENTIRE PROJECT, UNLESS SPECIFICALLY NOTED OTHERWISE (UNO)

1) GENERAL:

A. CONSTRUCTION DOCUMENTS:
   1. THE CONTRACTOR SHALL REVIEW THE APPROVED CONTRACT DOCUMENTS AND NOTIFY THE ENGINEER OF ANY ERRORS OR DISCREPANCIES PRIOR TO THE START OF CONSTRUCTION.
   2. THE CONTRACTOR SHALL NOTIFY THE OWNER IMMEDIATELY IF ANY UNIDENTIFIED EXISTING UNDERGROUND UTILITIES ARE DISCOVERED.
   3. THE STRUCTURAL CONTRACT DRAWINGS REPRESENT THE FINISHED STRUCTURE. THEY DO NOT INDICATE THE METHOD OF CONSTRUCTION. THE CONTRACTOR SHALL PROVIDE ALL MEASURES NECESSARY TO PROTECT THE STRUCTURE DURING CONSTRUCTION. SUCH MEASURES SHALL INCLUDE, BUT ARE NOT LIMITED TO, BRACING AND/OR SHORING FOR LOADS DUE TO CONSTRUCTION EQUIPMENT, ETC.
   4. UNDER NO CIRCUMSTANCES CAN STRUCTURAL COMPONENTS BE SUBSTITUTED, OMITTED, OR ALTERED FROM THE APPROVED SET OF CONSTRUCTION DOCUMENTS WITHOUT WRITTEN APPROVAL FROM THE ENGINEER.

B. DIMENSIONS AND NOTATIONS:
   1. WRITTEN DIMENSIONS SHALL TAKE PRECEDENCE OVER SCALED DIMENSIONS. DO NOT SCALE DRAWINGS.
   2. ABBREVIATIONS USED ON THE APPROVED CONSTRUCTION DOCUMENTS SHALL BE CONSIDERED TYPICAL ABBREVIATIONS FOR THE INDUSTRY. THE CONTRACTOR SHALL BE RESPONSIBLE TO NOTIFY THE ENGINEER IMMEDIATELY OF ANY ABBREVIATIONS THAT ARE UNKNOWN TO THE CONTRACTOR.

C. TYPICAL NOTES AND DETAILS:
   1. SPECIFIC NOTES AND DETAILS SHALL TAKE PRECEDENCE OVER STANDARD TYPICAL NOTES AND DETAILS.
   2. STANDARD TYPICAL NOTES AND DETAILS ARE TO BE USED WHEN REFERRED TO OR WHEN NO OTHER MORE RESTRICTIVE OR DIFFERENT DETAILS ARE SHOWN ON THE DRAWINGS.
   3. WORK NOT PARTICULARLY SHOWN OR SPECIFIED SHALL BE THE SAME AS SIMILAR PARTS THAT ARE SHOWN OR SPECIFIED.

D. CODE REQUIREMENTS:
   1. ALL WORK SHALL CONFORM TO THE MINIMUM STANDARDS OF REGULATING AGENCIES WHICH MAY HAVE AUTHORITY OVER ANY PORTION OF THE WORK.
   2. SPECIFICATIONS, CODES AND STANDARDS NOTED SHALL BE OF THE LATEST APPROVED ISSUE, INCLUDING SUPPLEMENTS, UNLESS NOTED OTHERWISE.
   3. MINIMUM UNIFORM (BLANKET) ROOF SNOW LOAD, AS DEFINED BY LOCAL BUILDING OFFICIAL OR STATE, SHALL BE DESIGNED FOR, AND IT IS THE RESPONSIBILITY OF THE MBSS ENGINEER TO CONFIRM IF ONE EXISTS BY CONTACTING THE LOCAL BUILDING OFFICIAL.

E. DEFERRED SUBMITTALS:
   1. DEFERRED STRUCTURE SUBMITTAL ITEMS HAVE NOT BEEN PERMITTED UNDER THE BASE BUILDING APPLICATION.
   2. THE CONTRACTOR SHALL SUBMIT COMPONENT SYSTEM DOCUMENTS FOR DEFERRED SUBMITTAL ITEMS, STAMPED BY A PROFESSIONAL ENGINEER LICENSED IN THE JURISDICTION HAVING AUTHORITY, TO THE REGISTERED DESIGN PROFESSIONAL IN RESPONSIBLE CHARGE FOR REVIEW AND FORWARD THE REVIEWED DOCUMENTS TO THE BUILDING OFFICIAL IN COMPLIANCE WITH SECTION 107.3.4.1 OF THE CBC.
   3. DEFERRED SUBMITTAL ITEMS SHALL NOT BE INSTALLED UNTIL THE COMPONENT SYSTEM DOCUMENTS HAVE BEEN APPROVED BY THE BUILDING OFFICIAL.
   4. THE FOLLOWING CONTRACTOR-DESIGNED PROJECT ELEMENTS ARE DEFINED AS DEFERRED STRUCTURAL SUBMITTAL ITEMS:

      PRE-ENGINEERED METAL BUILDINGS

2) CODES, STANDARDS, AND REFERENCES:

A. ASCE 7-16: MINIMUM DESIGN LOADS AND ASSOCIATED CRITERIA FOR BUILDINGS AND OTHER STRUCTURES.
B. ACI 318-14: BUILDING CODE REQUIREMENTS FOR STRUCTURAL CONCRETE.ACI 350-06: CODE REQUIREMENTS FOR ENVIRONMENTAL ENGINEERING CONCRETE STRUCTURES.
C. AISC 360-16 SPECIFICATION FOR STRUCTURAL STEEL BUILDINGS.

3) GRATING:

A. UNLESS INDICATED OTHERWISE, ALL GRATING SHALL BE FAS INDICATED IN THE DRAWINGS, OR APPROVED EQUAL.
B. WEIGHT OF GRATING SECTION SHALL NOT EXCEED 80 LBS.
C. PROVIDE A MINIMUM OF 4 CLIPS PER GRATING PANEL, APPROX 4" FROM PANEL CORNERS.
D. WIDTH OF GRATING SECTIONS SHALL NOT EXCEED 3'-0".
E. SHOP DRAWINGS BASED ON FIELD DIMENSIONS SHALL BE SUBMITTED TO THE ENGINEER PRIOR TO FABRICATION.
F. PROVIDE GRATING FASTENERS AS REQUIRED.
G. THE HORIZONTAL CLEARANCE BETWEEN THE GRATING AND GRATING SUPPORTS SHALL NOT BE LESS THAN ¼" NOR GREATER THAN ½"
H. ALL GRATING SECTIONS, WHEN IN PLACE, SHALL ALWAYS BE FIRMLY ANCHORED TO THEIR SUPPORTS.
I. PROVIDE MINIMUM BEARING PER MANUFACTURERS RECOMMENDATIONS FOR ALL FRP GRATING.

4) NON-SHRINK GROUT:

1. ALL GROUT WORK SHALL CONFORM TO THE LATEST EDITION OF ACI 301.
2. FORMWORK: DESIGN, ERECT, SUPPORT, BRACE AND MAINTAIN FORMWORK TO SUPPORT VERTICAL, LATERAL, STATIC AND DYNAMIC LOADS THAT MIGHT BE APPLIED UNTIL STRUCTURE CAN SUPPORT SUCH LOADS.

5) STRUCTURAL AND MISCELLANEOUS STEEL:

A. STRUCTURAL STEEL SHALL CONFORM TO THE FOLLOWING ASTM STANDARDS:
   a) WIDE FLANGE SHAPES — A992, GR 50 GALV
   b) OTHER SHAPES, PLATES, ANGLES AND BARS — A36 GALV
   c) STEEL PIPE — A53, GRADE B GALV
   d) HOLLOW STRUCTURAL SECTIONS — A500, GRADE B GALV
B. WELDS: PROVIDE 70KSI LOW HYDROGEN ELECTRODE OR PROCESS IN ACCORDANCE WITH AWS A5.1.
C. BOLTS, U.N.O.:
   1. STAINLESS STEEL: ASTM A193, GRADE 8, CLASS 2, AISI TYPE 316
D. DRILL AND EPOXY ANCHOR BOLTS:
   1. STAINLESS STEEL ASTM A193, GRADE 8, CLASS 2, AISI TYPE 316 OR EQUAL APPROVED BY ENGINEER
E. EPOXY BOLT OR EXPANSION BOLT SUBSTITUTIONS FOR EMBEDDED BOLTS IS PROHIBITED WITHOUT WRITTEN CONSENT FROM THE ENGINEER.
F. UNLESS NOTED OTHERWISE ON THE DRAWINGS, ALL EPOXY BOLTS SHALL BE AS SPECIFIED.
G. ALL STRUCTURAL STEEL SHALL BE DETAILED, FABRICATED, AND ERECTED IN ACCORDANCE WITH THE AISC CODE OF STANDARD PRACTICE, EXCEPT AS MODIFIED IN THESE NOTES AND THE PROJECT SPECIFICATIONS.
H. ALL STAINLESS STEEL SHALL BE TYPE 316.
I. SPLICING OF STEEL MEMBERS, UNLESS SHOWN ON THE DRAWINGS, IS PROHIBITED WITHOUT WRITTEN APPROVAL OF THE PROJECT ENGINEER.
J. GALVANIC PROTECTION SHALL BE PROVIDED BETWEEN DISSIMILAR METALS.
K. WELDING SHOWN FOR STAINLESS STEEL ELEMENTS SHALL COMPLY WITH AWS D1.6/D1.6M.

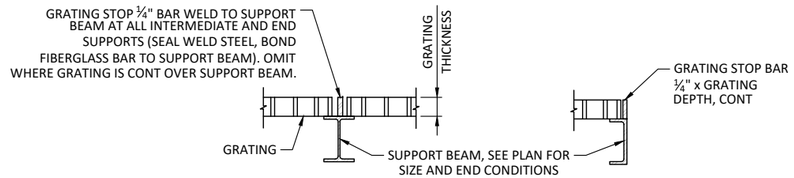
GRATING CLIP DETAIL



GRATING STOP DETAIL

NOTES:
1. UNLESS INDICATED OTHERWISE, ALL GRATING SHALL BE ALUM.
2. GRATING DEPTH TO BE DETERMINED BY MANUFACTURER AND APPROVED BY ENGINEER, UNO.
3. ALL ENDS AND OPENINGS SHALL BE BANDED.
4. WEIGHT OF GRATING SECTION SHALL NOT EXCEED 80 LBS.
5. METAL BEARING BARS SHALL BE DEPTH T x 3⁄16" @ 1 3⁄16" OC.. CROSS BARS SHALL BE @ 4" OC.
6. PROVIDE A MINIMUM OF 4 CLIPS PER GRATING PANEL, APPROX 4" FROM PANEL CORNERS. MAXIMUM CLIP SPACING AT 36" OC.
7. MATERIALS:
   - A. ALUM GRATING - USE ALUM ANGLE SUPPORTS AND SST BOLTS AND CLIPS. IF SUPPORTED BY STEEL BEAMS, USE STEEL STOP BARS. ALUM IN CONTACT WITH CONC OR STEEL SHALL BE COATED PER THE PROTECTIVE COATING SPECS.
   - B. GALV STEEL GRATING - USE STEEL ANGLE SUPPORTS, BOLTS AND CLIPS. GALV AFTER FABRICATION.
   - C. SST GRATING - USE SST ANGLE SUPPORTS, BOLTS AND CLIPS
   - D. FIBERGLASS GRATING - USE FIBERGLASS FOR ALL COMPONENTS EXCEPT DRILLED ANCHORS; ALL CUT EDGES SHALL BE SEALED WITH RESIN; BONDING: USE EPOXY ADHESIVE BONDING AGENT

GRATING FRAME TABLE SIZED TO MATCH GRATING (FOR FIBERGLASS USE CONTINUOUS PROTRUDED FIBERGLASS SEAT & ANCHOR)

B	BLUE
C	CLEAR
G	GREEN
NE	NEON
O	ORANGE
OP	OPALESCENT
P	PURPLE
R	RED
W	WHITE
Y	YELLOW

FIRST LETTER SUFFIX OF IEEE DEVICE DESIGNATION

A	GOVERNOR SYSTEM (OR ACTUATOR SYSTEMS - GATES)
B	BATTERY CHARGING AND MONITORING SYSTEM OR BUS
C	HIGH-VOLTAGE CABLE SYSTEM OR CLOSING RELAY/CONTACTOR
D	DATA ACQUISITION SYSTEM
E	EXCITATION SYSTEM INCLUDING TRANSFORMER AND REGULATOR BUT NOT MAIN FIELD
F	FIRE AND CO2 SYSTEM
G	MAIN GENERATOR INCLUDING AUXILIARY SYSTEMS OR GROUND
G/M	GENERATOR MOTOR INCLUDING AUXILIARY SYSTEMS IN PUMPED STORAGE APPLICATIONS
H	TURBINE OR MAIN PUMP INCLUDING AUXILIARY SYSTEMS
I	ISOLATED AND OTHER POWER BUS SYSTEMS (NOT HIGH VOLTAGE CABLE)
J	POWER CIRCUIT BREAKER INCLUDING AUXILIARY SYSTEMS
K	POWER TRANSFORMER INCLUDING AUXILIARY SYSTEMS
L	ANNUNCIATOR SYSTEM, SECURITY SYSTEM, LINE, OR LOWERING RELAY/CONTACTOR
M	MAIN PUMP MOTOR INCLUDING AUXILIARY SYSTEMS AND VARIABLE SPEED DRIVE
N	AIR (PNEUMATIC) SYSTEM OR NEUTRAL
O	OPENING RELAY/CONTACTOR
P	PENSTOCK OR DISCHARGE LINE SYSTEM
Q	OIL STORAGE, HANDLING, PURIFICATION SYSTEM
R	FIELD FLASHING SYSTEM, PHASE REVERSAL SWITCH INCLUDING AUXILIARY SYSTEM, OR RAISING RELAY/CONTACTOR
S	STATION SERVICE SUBSTATION SYSTEM INCLUDING ENGINE/GENERATOR SYSTEM
T	TONE AND TRANSFER TRIP SYSTEM OR TRANSFORMER
U	UNIT CONTROL CIRCUIT SYSTEM OR UNINTERRUPTIBLE POWER SUPPLY SYSTEM
V	INTAKE AND/OR DISCHARGE VALVE SYSTEM
W	WATER SYSTEMS INCLUDING INTAKE/OUTLET WORKS AND PLANT WATER AND SUMP SYSTEMS
X	DEFINED FOR SYSTEMS UNIQUE TO A FACILITY
Y	DEFINED FOR SYSTEMS UNIQUE TO A FACILITY
Z	DEFINED FOR SYSTEMS UNIQUE TO A FACILITY

SECOND AND SUBSEQUENT LETTER SUFFIXES OF THE IEEE DEVICE DESIGNATION

A	ABNORMAL, A.C., ACCELERATION, ADMISSION, ALARM, AMPERES, AUTOMATIC, AUXILIARIES, PHASE A, ECT.
B	BACKUP, BEARING, BLOCK, BLOWER, BOOSTER, BRAKES, BUS, BUTTON, BYPASS, PHASE B, ETC.
C	CABLE, CARRIER, CHARGER, CHECK, CHLORINATION, CLOSE, COLLECTOR, COMMON, COMPENSATOR, COMPRESSOR, CONTROL, COOLING, CURRENT, CYCLE, CYLINDER, PHASE C, CONVEYOR, ECT.
D	D.C, DECELERATION, DELAY, DEPRESS, DETECTOR, DIELECTRIC, DIFFERENTIAL, DISCHARGE, DISCONNECT, DISCORDANCE, DOMESTIC, DOWN, DOWNSTREAM, DRAFT TUBE, DRAIN, ETC.
E	EJECTOR, ELEVATOR, EMERGENCY, EXPLOSIVE, ETC.
F	FAILURE, FAN, FAULT, FEEDER, FIELD, FILTER, FIRE, FLAME, FLOW, FOLLOWER, FORWARD, FREQUENCY, FULL, FUMES, FUSE, ETC.
G	GAS, GATE, GATING (SCR), GENERATE, GROUND, GUIDE BEARING, ETC.
H	HALON, HAND, HEAT, HEATER, HIGH, HOIST, HORN, HOT, HOUSING, HYDROPNEUMATIC TANK, ETC.
I	INDICATION, INITIAL, INLET, INOUT, INSTANTANEOUS, INTAKE, INTERFACE, INTERLOCK, INTERRUPT, INVERTER, IONIZATION, ETC.
J	JACKING, JET, ETC.
K	KEY, TRANSFORMER
L	LAMPS, LEFT, LEVEL, LIGHTS, LIMITS, LINE, LIQUID, LOCAL, LOGIC, LOSS, LOUVERS, LOW, LOWER, LUBRICATION, ETC.
M	MAIN, MALFUNCTION, MANUAL, METER, METERING, MOTOR, ETC.
N	NEGATIVE, NETWORK, NEUTRAL, NORMAL, ETC.
O	OPEN, OUTLET, OUTPUT, ETC.
P	PACKING BOX, PARALLEL, PARAMETER, PENSTOCK, PHASE, PHASEBACK, PILOT, PIT, POSITION, POTENTIAL, POTHEAD, POWER, PRESSURE, PRIMARY, PROTECTION, PULSE, PUMP, PURIFICATION, PUSH, ETC.
Q	OIL, ETC.
R	RAISE, REACTOR, RECLOSE, RECORD, RECTIFIER, REED, REFRIGERATION, REGULATE, RELAY, RELEASE, RELIEF, REMOTE, RESERVOIR, RESET, RESISTOR, RIGHT, ROTATION, ROTOR, RUNNER, ETC.
S	SEALS, SECONDARY, SELECTOR, SEWAGE, SHORTING, SHUTDOWN, SIGNAL, SKIMMER, SLUDGE, SMOKE, SOLENOID, SPEED, SPIRAL OR SCROLL CASE, SPLICE, STABILIZER, STANDBY, STARTING, STATOR, STEPPING, STORAGE, STRAINER, SUCTION, SUMP, SUPPLY, SWITCH, SYNCHRONIZING, ETC.
T	TANK, TEMPERATURE, TEST, THERMAL, THRUST BEARING, THYRATRON, TIE, TIME, TRANSDUCER, TRANSER, TRANSMITTER, TRIP, TROUBLE, TRASHRAKE, ETC.
U	UNIT, UNLOADER, UNWATERING, UP, UPPER, UPSTREAM, ETC.
V	VALVE, VARS, VIBRATION. VOLTAGE, ETC.
W	WATER, WATTS, WINDINGS, ETC.
X	AUXILIARY DEVICE, ETC.
Y	AUXILIARY TO DEVICE X, ANTIPUMP RELAY, ETC.
Z	AUXILIARY TO DEVICE Y

ABBREVIATIONS

A, AMP	AMP, AMPERE
AAAC	ALL ALUMINUM ALLOY CONDUCTOR
AC	ALTERNATING CURRENT
AF	AMPERE FRAME SIZE
AFD	ADJUSTABLE FREQUENCY DRIVE
AFF	ABOVE FINISHED FLOOR

Technical Memorandum			
To:	Mike Brodie, P.E. Chugach Electric Association	Project:	Eklutna Fish & Wildlife Project
From:	Sean P. Ellenson, P.E. McMillen, Inc	cc:	Curtis Neibaur McMillen, Inc
Prepared by:	Paul Rader McMillen, Inc	Job No.:	22-028
Date:	October 6, 2023		
Subject:	Class 4 Opinion of Probable Construction Costs - Eklutna Dam Outlet Modifications		

Revision Log

Revision No.	Date	Revision Description
0	October 6, 2023	Initial Draft

1.0 Introduction

1.1 Purpose

This technical memorandum (TM) presents a summary of the Opinion of Probable Construction Costs (OPCC) for the Eklutna Dam Outlet Modifications as part of the Eklutna Fish & Wildlife Project. The OPCC estimates are based on the 15% Design drawing package dated October 6, 2023.

1.2 Background

The Eklutna Hydroelectric Project (Project) is located in Southcentral Alaska approximately 30 miles northeast of downtown Anchorage near the Native Village of Eklutna (NVE). The Project was originally constructed by the Federal government in the 1950s but was later sold to, and is currently owned by, the Municipality of Anchorage (MOA), Chugach Electric Association, Inc. (Chugach), and the Matanuska Electric Association (MEA), collectively the “Project Owners”. As part of the sale of the Project, the current Project Owners entered into the 1991 Fish and Wildlife Agreement (1991 Agreement) with the National Marine Fisheries Service (NMFS), U.S. Fish and Wildlife Service (USFWS), and the State of Alaska (the Parties). The 1991 Agreement requires the Project Owners to develop and propose to the Governor of Alaska (Governor) a program to protect, mitigate damages to, and enhance fish and wildlife impacted by the development of the Project.

In development of the program, the Project Owners have met with various stakeholders to identify protection, mitigation, and enhancement measures that may be implemented within the Project study area. These measures were incorporated into a Phase 1 Engineering Feasibility Study which advanced the preliminary design, estimated capital expenditures, and determined operations and maintenance costs for each alternative for the purposes of evaluation. Selected measures from the Phase 1 Engineering Feasibility Study have been advanced to a Phase 2 Engineering Feasibility Study which includes a 15% level of design and a Class 4 OPCC.

1.3 Estimation Preparation

McMillen has utilized historical cost data from similarly technical projects which we have designed or constructed as a self-performing general contractor, as the basis of our Class 4 OPCC estimate. Appropriate overhead and profit markups have been included below the subtotal to account for the competitive bidders' markups, they are likely to apply on their bid prices. A 20% contingency has been included at this stage to account for details and minor project features which are not yet included in the project documents at the 15% Design level of detail. The contingency value may be reduced in future versions of the OPCC estimate, as the project design is advanced.

General requirement and mobilization costs are estimated at 12% and 8% of construction activity costs based on historical project ranges. Overhead and profit markups have been included at 10% and 5% respectively of direct construction costs. The estimate is in 2023 dollars. No escalation is included in the pricing. This OPCC estimate is consistent with a Class 4 estimate as defined by the AACE classification system, as shown in Figure 1-1 and 1-2. For the purposes of this project, McMillen has utilized the accuracy range of -30% to +50%.

CLASS 4 ESTIMATE	
Description: Class 4 estimates are generally prepared based on limited information and subsequently have fairly wide accuracy ranges. They are typically used for project screening, determination of feasibility, concept evaluation, and preliminary budget approval. Typically, engineering is from 1% to 15% complete, and would comprise at a minimum the following: plant capacity, block schematics, indicated layout, process flow diagrams (PFDs) for main process systems, and preliminary engineered process and utility equipment lists. **Level of Project Definition Required:** 1% to 15% of full project definition. **End Usage:** Class 4 estimates are prepared for a number of purposes, such as but not limited to, detailed strategic planning, business development, project screening at more developed stages, alternative scheme analysis, confirmation of economic and/or technical feasibility, and preliminary budget approval or approval to proceed to next stage.	**Estimating Methods Used:** Class 4 estimates virtually always use stochastic estimating methods such as equipment factors, Lang factors, Hand factors, Chilton factors, Peters-Timmerhaus factors, Guthrie factors, the Miller method, gross unit costs/ratios, and other parametric and modeling techniques. **Expected Accuracy Range:** Typical accuracy ranges for Class 4 estimates are -15% to -30% on the low side, and +20% to +50% on the high side, depending on the technological complexity of the project, appropriate reference information, and the inclusion of an appropriate contingency determination. Ranges could exceed those shown in unusual circumstances. **Effort to Prepare (for US$20MM project):** Typically, as little as 20 hours or less to perhaps more than 300 hours, depending on the project and the estimating methodology used. **ANSI Standard Reference Z94.2-1989 Name:** Budget estimate (typically -15% to + 30%). **Alternate Estimate Names, Terms, Expressions, Synonyms:** Screening, top-down, feasibility, authorization, factored, pre-design, pre-study.

Figure 1-1: Class 4 Estimate Description

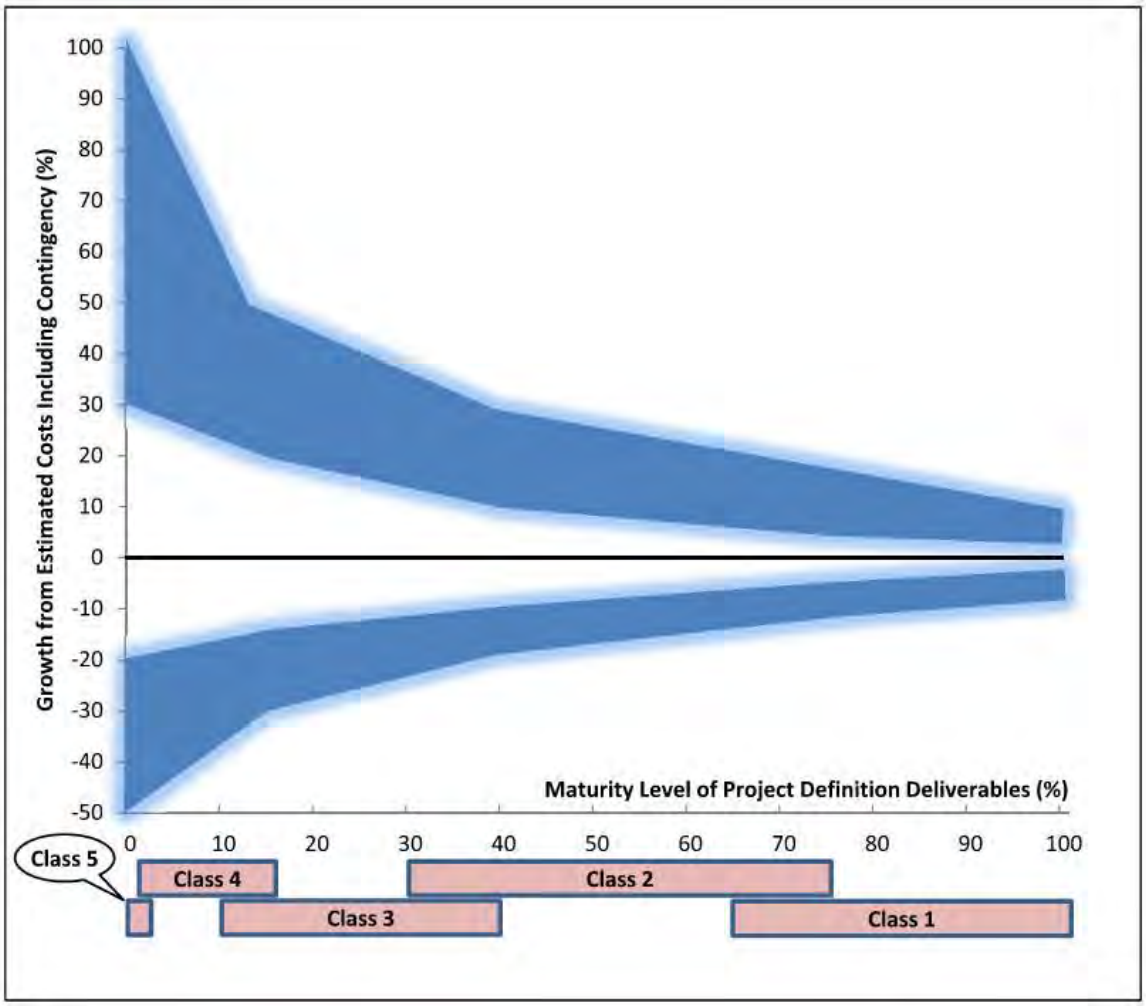

Figure 1-2: Variable in Accuracy Ranges (AACE 69R-12)

2.0 Project Cost Estimate

This OPCC estimate is consistent with a Class 4 estimate as defined by the Association for the Advancement of Cost Engineering (AACE) standard practice 69R-12. The maturity level of the project definition warrants a wide range of potential growth as the project design progresses. The Eklutna feasibility OPCC is based on 15% Design Drawings.

2.1 Cost Assumptions and Qualifications

The cost estimate was primarily developed utilizing costs from past projects and estimates. Below is a summary of the cost basis including any assumptions necessary for cost estimating purposes at this stage of design.

Common Cost Basis:

- General requirement and mobilization costs are based on a typical percentage of total direct construction costs: 12% and 8% respectively.
- Overhead & profit are added to direct construction costs at 10% and 5% respectively.
- A 20% contingency is added to the costs which is a typical contingency at the early concept phase of a project.
- Site access and laydown areas were all based on a unit price of $160k per acre for 0.3 acres.
- All handrail and grating costs are based on recent supply and install estimates.
- All electric controls are assumed to include a PLC for semi-automatic control capabilities along with standard instrumentation readouts.
- Electrical overhead and underground transmission costs provided by MEA.
- Transformer costs are provided by MEA.

Phase 2 Engineering
Eklutna Dam Outlet Modifications

Line Item	Item	Quantity	Unit	Unit Cost	Total Cost	Total
01	**DIVISION 01 INDIRECTS**					**$91,772**
	Mobilization and Establishment of Site Infrastructure	8	%	0.08	$36,709	
	Contractor General Requirements (Percentage of Direct Cost)	12	%	0.12	$55,063	
02	**SITE CONSTRUCTION AND ACCESS ROADS**					**$40,184**
	Site Access - Construct Laydown Areas, Turnarounds and Crane Pads	0.3	ACRE	$160,736.40	$40,184	
03	**SPILLWAY MODIFICATIONS**					**$48,139**

	Main Panelboard	1	EA	$10,000.00	$10,000	
	Instrumentation & Gate Controls	1	LS	$81,000.00	$81,000	
	Project Subtotal (without Division 01)					**$458,861**
	Project Subtotal					**$550,634**

AACE International CLASS 4 Cost Estimate - Class 4 estimates are generally prepared based on limited information and subsequently have fairly wide accuracy ranges. They are typically prepared for a number of purposes, such as but not limited to, detailed strategic planning, business case development, project screening at more developed stages, alternative scheme analysis, confirmation of economic and/or technical feasibility, selection of a feasible alternative and preliminary budget approval to proceed to next stage of the project (definition phase). Typically, engineering is from 1% to 15% complete, and would comprise at a minimum the following: Feasibility design for several alternative layouts to include design criteria, generation capacity, feasibility level drawings, preliminary one-line diagrams, and comprehensive user requirements. Class 4 estimates generally use stochastic estimating methods such as cost/capacity graphs or curves and factors, historical data and other parametric and modeling techniques. Typical accuracy ranges for Class 4 estimates are -15% to -30% on the low side, and +20% to +50% on the high side, depending on the technological complexity of the project, appropriate reference information, and other risks (after inclusion of an appropriate contingency determination). Ranges could exceed those shown if there are unusual risks.

Assumptions:
(1) Flow released through Gate year-round
(2) Facility operator is required to visit the site twice per week.
(3) The gate will be fitted with an instrumentation system capable of automated gate position changes to accommodate lake level fluctuations.
(4) Power consumption is estimated based on daily gate position changes and general site power consumption.
(5) A 2 day outage was assumed for performing inspection and maintenance of the gate chamber
(6) Electrical and mechanical maintenance support assumes ongoing support for gate and instrumentation system.
(7) Facility operator is a trained local operator with general mechanical skills.
(8) Labor Wages Per State of Alaska Minimum Rates of Pay; September 2023

	Class	Monthly	Hourly
Trap Operator/Truck Driver	A2106		$ 70.64
Trap Technician - Biological Technician	S1201		$ 68.86
Electrician	A0707		$ 84.45
Mechanic - Maint. & Ops. Supervisor	A1601		$ 75.04

1.0 Introduction

1.1 Purpose

The purpose of this report is to present the design documentation associated with the development of the Spillway Modifications as part of the Eklutna Fish & Wildlife Program (Project). The design documentation report (DDR) summarizes the pertinent data, design criteria, and standards used as the basis for the 15% level of design of the Project. The DDR documents the data, criteria, and standards by engineering discipline, and provides information about the operation of the design components associated with the Project.

The information presented within this DDR will be updated throughout the design development process to reflect refinement of the Project components and facilities, and advancement of the design analysis and details.

1.2 Location

The Project site is located in Southcentral Alaska approximately 30 miles northeast of downtown Anchorage near the Native Village of Eklutna. The Project footprint spans lands owned and managed by the State of Alaska, Eklutna Inc., and the Bureau of Land Management, with the dam and proposed modification to the dam spillway occurring on land owned by the State of Alaska. As proposed, the Project involves modifying the spillway within Eklutna Dam by removing the uncontrolled ogee crest overflow structure and replacing it with a fixed wheel gate and hoist for allowing controlled spills from Eklutna Lake. The location of Eklutna Dam and its vicinity to other features of the overall project is presented in Figure 1-1.

1.3 Background and Objectives

As part of the Eklutna Fish & Wildlife Program, Chugach Electric Association, Matanuska Electric Association, and the Municipality of Anchorage, known collectively as the Owners of the Eklutna Hydroelectric Project (Owners) are studying various means of providing water to the Eklutna River to mitigate damages to, and enhance fish and wildlife impacted by development and continuing operation of the Project. During the consultation process with various stakeholders to the Project, requests were made to replace the existing overflow spillway at the dam with a fixed wheel gate because either (1) climate change may cause inflows to the reservoir to increase significantly, which may increase the likelihood of future spill events, and a fixed wheel gate will allow the Project Owners to better manage those future spill events, or (2) while modeling results show that the default channel maintenance flow regime will maintain spawning gravels in the wetted reach of the Eklutna River, future

monitoring may show that a higher magnitude channel maintenance flow that exceeds the combined hydraulic capacity of the existing outlet gate and the Eklutna River Release Facility may be warranted. The purpose of this report is to document the design criteria and analyses performed for the engineering development of the spillway modifications to Eklutna Dam.

1.4 Report Organization

This DDR is a record of the design effort for the Project and specifically describes the details of the design process and work effort for the Dam Outlet Modifications. The DDR consists of a summary of the design elements, criteria, methods and approach, engineering calculations, and pertinent references. The major report sections and intended purpose are presented in Table 1-1.

Table 1-1. Major Report Sections and Purpose.

Section	Description	Purpose
1	Introduction and Background	Presents the Project background, purpose, location, authorization, objectives, feature scope, and the report organization.
2	General Description	Summarizes the basic design criteria that are used as the basis of design.
3	Existing Infrastructure	Summarizes the existing infrastructure related to the Project.
4	Project Infrastructure and Operation	Describes the proposed modifications for the Eklutna Dam spillway.
5	Structural Design	Includes information related to the structural design of the fixed wheel gate, guides, and stability of the dam.
6	Mechanical Design	Includes information related to the mechanical design of the gate hoist.
7	Electrical and Instrumentation / Control Design	Includes information related to the electrical design and instrumentation and controls associated with the spillway modifications.
8	References	Documents the references used in developing the design.

Section	Description	Purpose
Appendices		
A	15% Design Drawings	Presents the 15% design drawings for the Eklutna Dam Spillway Modifications
B	Class 4 OPCC	Presents the Class 4 Opinion of Probable Construction Costs for the Eklutna Dam Spillway Modifications.

2.0 General Description

2.1 General Design Criteria and Standards

General design criteria and standards for the Project include the abbreviations, survey datum, topographic mapping, references, and design standards as described below.

2.1.1 Standard List of Terms and Abbreviations

AACE	Association for Advancement of Cost Engineering
AC	alternating current
ACI	American Concrete Institute
AF	acre-ft
AISC	American Institute of Steel Construction
ANSI	American National Standards Institute
ASTM	American Society of Testing and Materials
AWWA	American Water Works Association
AWWU	Anchorage Water and Wastewater Utility
BMP	Best Management Practice
CADD	computer aided design and drafting
CEA	Chugach Electric Association
cfm	cubic feet per minute
cfs	cubic feet per second
DC	direct current
DDR	Design Documentation Report
ERRV	Eklutna River Release Valve
El.	elevation
fps	feet per second
ft	feet
HDC	Hydraulic Design Criteria
HEC	Hydrologic Engineering Center
HMI	human-machine interface
HPU	hydraulic power unit

HVAC	heating, ventilation, and air conditioning
Hz	hertz
IESNA	Illuminating Engineering Society of North America
I/O	Input/Output
IBC	International Building Code
IEEE	Institute of Electrical and Electronics Engineers
LED	light-emitting diode
LiDAR	Light Detection and Ranging
MEA	Matanuska Electric Association
MGD	million gallons per day
MOA	Municipality of Anchorage
MSL	Mean Sea Level
NAD83	North American Datum of 1983
NAVD88	North American Vertical Datum of 1988
NEC	National Electric Code
NEMA	National Electrical Manufacturers Association
NESC	National Electrical Safety Code
NFPA	National Fire Protection Association
NGVD29	National Geodetic Vertical Datum of 1929
NVE	Native Village of Eklutna
O&M	operation and maintenance
pcf	pounds per cubic foot
PLC	programmable logic controller
psi	pounds per square-inch
RTD	Resistance Temperature Detector
SCADA	Supervisory Control and Data Acquisition
UL	Underwriters Laboratories
UPS	uninterruptible power supply
USGS	U.S. Geological Survey
V	volt

2.2 Survey Datum

Multiple vertical survey datums are reported in and around the main features of the Project. The following datums are identified within the Project area:

1. The MOA conducted LiDAR survey flights over the Project Area between May 12-30, 2015. The vertical datum this data is presented in is NGVD 1929 – M.O.A. 1972 Adjustment (MOA72).

2. McMillen contracted NV5 Geospatial to conduct LiDAR survey flights over the Project Area on May 28, 2020 and on May 18, 2022. The vertical datum this data is presented in is NAVD88, GEOID12B.

3. The As-Built Drawings for the dam and spillway are used for the reservoir modeling and hydraulic analysis. The drawings are titled “Eklutna Project – Alaska; Rehabilitation Pressure Tunnel” dated November 16, 1964 (USBR, Eklutna Project - Alaska. Rehabilitation Pressure Tunnel. As Built Drawings 1964). The vertical datum for these drawings is currently unknown and shall be referred to as “Local Datum” until further information is gathered.

4. The As-Built drawings of the AWWU lake diversion tunnel and pipeline are utilized as part of the design of the proposed facility. The drawings are titled “Eklutna Water Project” dated January 2, 1986 (AWWU 1986). The vertical datum used in these drawings is the GAAB Post-Quake, USC&GS, MSL, 1972. As currently understood this datum is identical to and used interchangeably with MOA72.

5. The USGS gauge station 15278000 Eklutna Lk Nr Palmer AK is reported by USGS to be based on the NGVD29. Discussions with USGS revealed that this is not necessarily the case, rather the gauge is tied to a brass cap set on the Eklutna Dam spillway wall.

The survey datum that will be utilized as the basis of this Project and the basis of all elevations within this report is NAVD88 GEOID 12B in terms of elevation with respect to Mean Sea level (MSL), US Foot. A conversion was determined from each of the unique project datums to correct to NAVD88 for the purposes of this investigation (McMillen 2022). The calculated correction factors between vertical datums used as part of the Eklutna Project is presented in Table 2-1.

Table 2-1. Eklutna Vertical Datum Conversion.

Vertical Datum	Conversion to NAVD88 (ft)	Notes
NAVD88	+0.00	
USGS Gauge	+3.263	Based on Staff Gauge Measurements at Dam
Local Datum	+3.593	Based on 2003 Survey at Dam
MOA72	+6.339	Based on 1987 Survey at Dam
	+6.520	Based on 2015 MOA LiDAR report

3.0 Existing Infrastructure

3.1 Eklutna Dam

The existing dam is located approximately 1,400 feet downstream of the natural outlet of Eklutna Lake. It is an earth and rock fill embankment dam with a crest length of 815 feet, a crest width of 30 feet, and a crest elevation (El.) of 894.6 feet (NAVD88) (USBR 1967). The crest of the dam is finished with crushed rock material to form a stable road surface, as shown in Figure 3-1. The dam allows for storage of water in Eklutna Lake for use throughout the year for power generation and water supply.

Figure 3-1. Dam Crest and Ungated Overflow Spillway, Looking North.

An ungated overflow spillway is incorporated within the middle of the dam. The reinforced concrete spillway consists of an inlet structure 105.54 feet long, a rectangular conduit section 83.80 feet long, a chute 77.66 feet long, and a stilling basin 89.00 feet long. The inlet structure contains a concrete overflow crest with a width of 18-feet and a crest elevation of El. 874.59 ft msl (NAVD88). The floor of the spillway is at El. 855.59 ft msl (NAVD88) for a total crest height of 19 feet. The design discharge capacity of the spillway is 3,315 cfs which corresponds to a reservoir water surface elevation of El. 888.39 ft msl (NAVD88). A cross sectional drawing of the structure is presented in Figure 3-2 with photographs of the spillway provided in Figure 3-3.

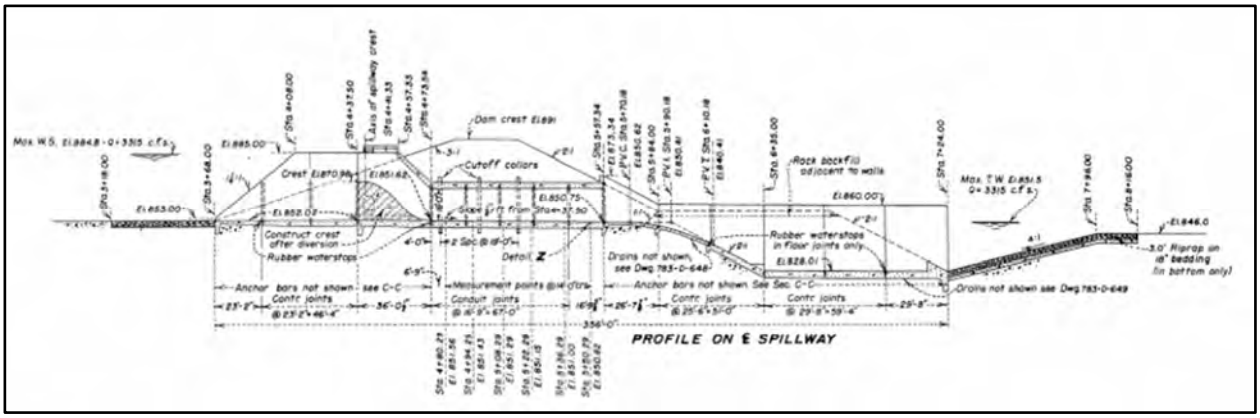

Figure 3-2. Cross Sectional View of Eklutna Dam Spillway.

Figure 3-3. Top View of Spillway (Left). Upstream Face of Spillway (Right).

4.0 Project Infrastructure and Operation

4.1 Spillway Infrastructural Modifications

The proposed modification to the Eklutna Dam Spillway involves the removal of the existing concrete overflow crest, installation of gate guides and sill plate, and installation of a fixed wheel gate, hoist, and hoist support structure. The concrete overflow crest currently provides stability to the concrete training walls; thus, removal of this element will introduce a new loading condition on the walls that must be addressed as part of the proposed scope of work. The modifications to address this new loading condition involve bracing the spillway training walls on the upper deck, which will also serve as the gate hoist platform. During the development of the design, the Alaska Department of Natural Resources Dam Safety division will be closely collaborated with to ensure the dam is protected during construction and operation of the new spillway gate. Details of the structural analysis of the existing spillway training walls under the new loading condition are provided in Appendix C. A section of the proposed infrastructural elements within the spillway is presented in Figure 4-1.

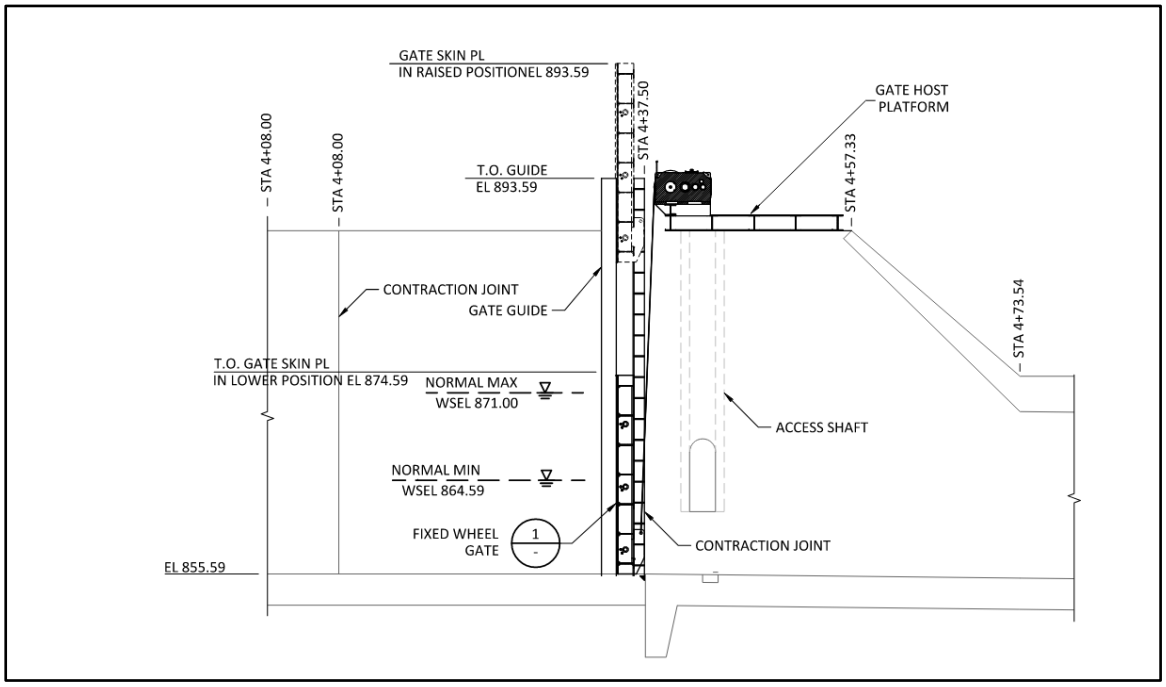

Figure 4-1. Spillway Modifications – Cross Section.

The gate hoist platform will consist of five W18x71 beams anchored across the span of the spillway. This platform will double as the support platform for the hoisting equipment for the gate. A new security fence will be located along the perimeter of the gate hoist platform and spillway upper deck to restrict public access and protect against theft or vandalism.

4.2 Fixed Wheel Gate

To control the flow within the spillway for regulated spill events or for future channel maintenance flow purposes, a fixed wheel gate will be implemented at Eklutna Dam. A fixed wheel gate is a type of vertical lift gate which utilizes wheels located on a fixed axle to transmit loads into the guides and supporting structure. These gates are commonly used in dams and other hydraulic structures due to their reduced friction requiring smaller hoisting mechanism and them being fairly economical to fabricate. A representative photograph of two fixed wheel gates at an existing dam intake is provided in Figure 4-2.

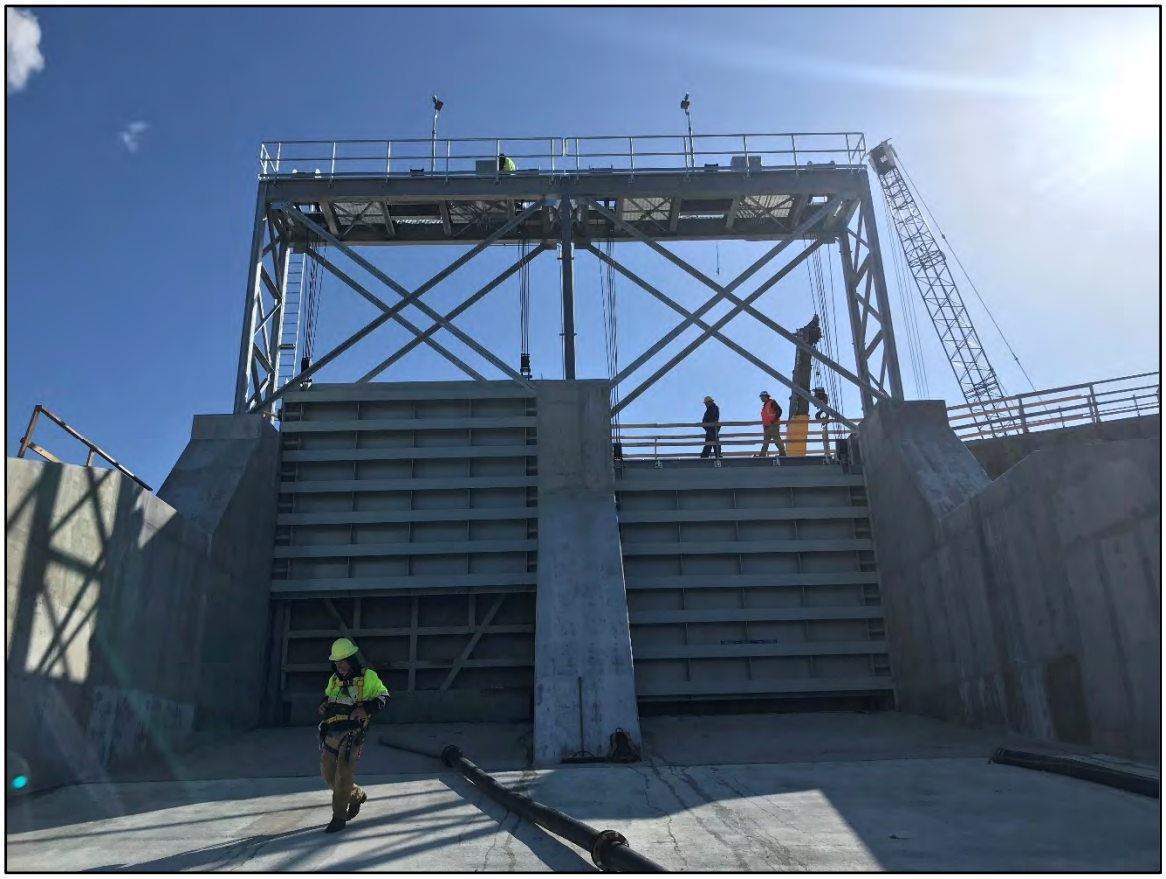

Figure 4-2. Fixed Wheel Gates at Dam Intake.

The fixed wheel gate would be lifted by a wire rope hoisting mechanism located on the proposed hoist platform on top of the spillway. The gate would be actuated locally via push button controls or remotely via the SCADA network. A stage-discharge relationship would be developed for the gate such that the flow rate released into the river may be calculated as a function of the gate opening position and the water surface elevation of the lake.

5.0 Structural Design Criteria

The structural design criteria apply to all design procedures to be implemented during the Project design. Structural design considerations listed in this section include material selection and design requirements that are intended to be incorporated into the Project. Structural Calculations may be found in Appendix A.

5.1 Applicable Codes and Standards

The structural design of the gate and hoist platform will conform to the following reports, criteria, and industry codes and standards. The applicable version of each document is the latest edition in force unless noted otherwise. References to the specific codes and standards will be included in the applicable technical specifications as the final design documents are prepared.

Table 5-1. Structural Codes and Standards.

Number	Description
Building Code	
ASCE 7	ASCE 7/SEI 7-16 Minimum Design Loads for Buildings and Other Structures, 2016
Design Standards and References	
ACI 318	Building Code Requirements for Structural Concrete, 2014
AISC 360	Specification for Structural Steel Buildings, 2016
ASIC SCM	Steel Construction Manual, 14th Edition
AWS D1.1	Structural Steel Welding Code – Steel
USACE EM 1110-2-2107	Design of Hydraulic Steel Structures

5.2 Materials

Materials and standards for concrete, concrete-related materials, structural steel, and miscellaneous metals for the Project are indicated in Table 5-2.

Table 5-2. Structural Materials and Design Standards.

Component	Material and Standard
Concrete and Related	
Existing Concrete	Compressive Strength (static), f'ce = 3000 psi
Adhesive Anchors	Two component epoxy, ASTM C-881 (with SS threaded anchor rod or reinforcing dowels)
Structural Steel	
Wide Flange Shapes	ASTM A992, Grade 50ksi
M, C, L shapes	ASTM A572, Grade 50ksi
Tube (HSS)	ASTM A500, Grade C. (46ksi Round / 50ksi Rect.)
Plates and Bars	ASTM A572, Grade 50ksi
High-Strength Bolts	ASTM F3125, Grade A325
Anchor Rods	ASTM F1554, Grade 50ksi (threaded) A193, Type 316 Stainless Steel
Miscellaneous Metals	
Guardrail and Grating	Galvanized steel

5.3 Design Loads

The general load types considered in the design of the structure are summarized in Table 5-3.

Table 5-3. Structural Design Loads.

Load Type	Description
Dead	Self-weight of all permanent structural elements as well as super-imposed weight of permanent mechanical and electrical equipment and piping.
Live	Temporary loads produced by the use and occupancy of the building or structure (excluding environmental loads). This load type includes those produced by movable objects and loads on guardrails, fixed ladders, and handrail systems by maintenance personnel.
Wind	Wind loads will be applied to all solid surfaces of the access platform and framing.

Seismic	Inertial forces produced by ground motion during a seismic event. The effects of this load type will be approximated based on the provisions of ASCE7.

5.3.1 Design Basis for Hoist Platform

Design of the access platform framing, guardrail, and connections will satisfy Load Factor and Resistance Design (LRFD) methodology by providing the required strength defined by the equation below:

$$U = \sum \gamma_i L_{ni} \leq \phi R_n$$

Where:

- $U =$ required strength
- $\gamma_i =$ load factors per ASCE 7
- $L_{ni} =$ load effects per structural calculations
- $\emptyset =$ resistance factor from ASCE 7
- $R_n =$ nominal resistance from ASCE 7

This methodology will be applied to the design of other material types in accordance with the relevant design standards and references. Refer to the structural calculations for additional information and derivation of these equation variables for specific Project features and components.

5.3.2 Design Basis for Fixed Wheel Gate

The proposed spillway fixed wheel gate will consist of a single steel skin plate welded to a series of WT shapes that are welded to a thick end plate. This design provides strength, stiffness and reliability. The roller wheel system is adjustable so that the wheels can be custom fit to the field conditions.

The gates will be fabricated from ASTM A709 Grade 50 steel and coated with a polyamine cure epoxy paint system. This type of steel is used in modern bridge fabrication because of its high toughness properties which resists sudden fracture. Seal retainer plates and bearing plates will be painted steel to reduce the amount of dissimilar metals in the vicinity which cause corrosion. The seal retainer bolts will be stainless steel. It is noted that some manufacturers choose to provide stainless steel wheels, axles, and embedded parts; however, carbon steel materials are allowed. Carbon steel components will be painted in order to provide corrosion resistance, and these coatings must be maintained by the Owners.

6.0 Mechanical Design Criteria

The mechanical design criteria apply to all design procedures to be implemented during the Project design. Mechanical design considerations listed in this section include detailing of mechanical components, material selection, and design requirements that are intended to be incorporated into the Project. Mechanical design calculations may be found in Appendix B.

6.1 Applicable Codes and Standards

The mechanical design will conform to the following reports, criteria, and industry codes and standards. The applicable version of each document is the latest edition in force unless noted otherwise. References to the specific codes and standards will be included in the applicable technical specifications as the final design documents are prepared.

Table 6-1. Mechanical Codes and Standards.

Codes & Standards	Description
ASTM	American Society of Testing and Material
ANSI	American National Standards Institute
ASME	American Society of Mechanical Engineers
ASME B16.5	Steel Pipe Flanges
AWS	American Welding Society
CMAA	Crane Manufacturers Association of America
FIST	Facilities Instructions, Standards and Techniques Manuals
MSS	Manufacturers Standardization Society of Valves and Fittings
USACE EM 1110-2-2610	Mechanical and Electrical Design for Lock and Dam Operating Equipment

6.2 Materials

Materials and standards for the mechanical components of the Project are indicated in Table 6-2.

Table 6-2. Mechanical Materials and Design Standards.

Component	Material and Standard
Wire Rope	6x37 Extra Improved Plow Steel – Stainless Steel
Gate Roller Bearings	Fabric Reinforced Composite Self Lubricated Bearing (CIP 151A)
Gate Roller Shafts	17-4 PH Stainless Steel
Cranes and Hoists	Steel with Vendor Coating Systems

6.3 Design Loads

6.3.1 Design Basis for Gate Hoist Components

USACE and ASME standards will be primarily used to guide spillway hoist and gate mechanical components. USACE EM 1110-2-2610 “Mechanical and Electrical Design for Lock and Dam Operating Equipment” and ASME B30.20 “Below the Hook Lifting Devices” are the most applicable. In general, they follow the Allowable Strength Design (ASD) method with the following design criteria:

- Normal operation load cases require that design stresses do not exceed 20% of material ultimate strength.
- Overload load cases require that design stresses do not exceed 75% of material yield strength.
- Overload load cases require that rope loads do not exceed 70% of minimum breaking strength.
- Self-lubricated bushing average bearing loads do not exceed 3,000 psi for normal operating conditions.

Off-the-shelf components will utilize their rated loads as they are assumed to have incorporated appropriate safety factors. In other words, the safety factors listed above will not be applied to off-the-shelf components.

6.3.2 Load Case A – Normal Operation

The normal operation load case (LCA) will be calculated based on the worst-case friction and efficiency values that would be obtained with moderate maintenance performed on the mechanical systems over the 50-year design life. This load case assumes that the hoist and gate are functioning as designed. Per the requirements of USACE EM 1110-2-2610, the hoist

system will be designed for a factor of safety of 5 for this load case. Load Case A is comparable to SG, U2 in Table 3-19 of USACE ETL-584. The normal operation loads on the hoist system are a function of the external loads applied to the gate (hydrostatic forces, gravitational forces, friction forces, etc.). To calculate the load required to lift the spillway gate (tension in hoist ropes), a free body diagram has been created. Operating loads were applied to the free body diagram and a summation of forces and moments was performed to solve for the tension in the wire ropes.

6.3.3 Load Case B – Maximum Allowable Motor Torque of Hoist

Load Case B (LCB) will be defined as the maximum torque of the motor applied to the hoist. Per the requirements of EM 1110-2-2610, the hoist system will be designed to not exceed 75% of the yield of the components under this loading except for wire rope, which will be limited to 70% of minimum breaking strength based on the guidance of USACE EM 1110-2-3200. This load case is not directly covered in USACE ETL 584 for the structural design of the gate. However, this load case is most comparable to SG.X3 in Table 3-19. This load case will be calculated based on breakdown torque of motor, which per NEMA MG-1 specifies at 200% of rated motor torque for a NEMA B motor.

6.4 Hoist Performance Criteria

6.4.1 Rated Load

The hoist load will be based on the loads listed below in Table 6-3. This rating is driven by the load required to lift the gate out of the slot under flow. It should be noted that the gate operation will require lifting from the sill at maximum normal water elevation. The contributions to hoist load total are listed in Table 6-3.

Table 6-3. Basic Hoist Loads.

Description	Load
Gate Weight, lbf	23,100
Roller Friction, lbf	20,368
Seal Friction, lbf	515
Ice and Mud, lbf	2,000
Inertial Loading, lbf	48

6.4.2 Gate Travel Speed

Gate travel speed will be one foot per minute, which is typical for dam or spillway gates of this size. The slow operating speed additionally will help regulate the down ramping within the river during spill events to prevent fish stranding.

6.4.3 Motor Sizing

The required power to operate the gates is 2 hp. A 5hp NEMA B motor was selected to be conservative at this time. The calculations to determine the motor capacity are provided in Appendix C.

6.4.4 Hoist Configuration

The hoist configuration will consist of a single 5-hp NEMA B motor with a motor brake driving a parallel shaft reducer with two output shafts, which drives two grooved wire rope drums through an 8-inch-diameter drive shaft supported by two pillow block roller bearings supporting each. The rope will be stainless steel rope and will require no maintenance or lubrication. Each side of the hoist will be two-part rope configuration (Figure 6-1).

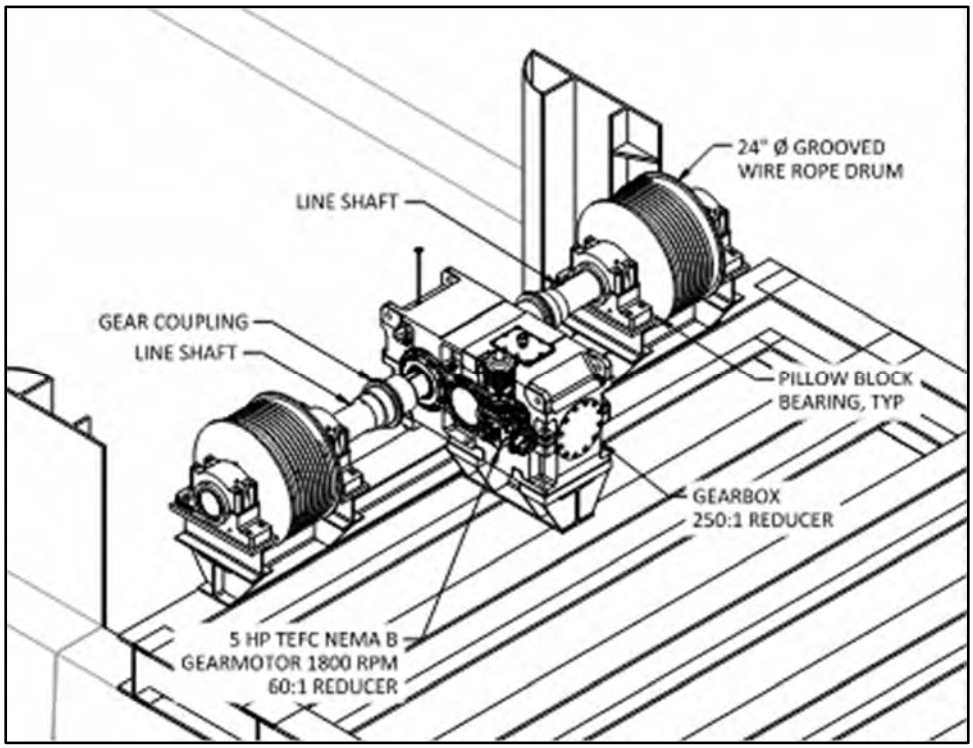

Figure 6-1. Hoist Configuration.

6.4.5 Hoist Wire Rope

The wire rope used will be 1 3/8-inch steel wire rope rated at a minimum 77,700 lbf breaking strength per ASTM A1023 – Standard Specification for Carbon Steel Wire Ropes for General Purposes.

6.4.6 Overload Limit Device

No overload limit device is required as the system will be capable of withstanding breakdown motor torque (load case B) without being damaged.

6.4.7 Hoist Brake

The motor hoist brake will be rated to be at least 250% rated motor torque. This this is a higher rating than USACE EM 1110-2-2610 chapter 2-2b recommends but will ensure that motor cannot overpower the brake if erroneously engaged. A disk type brake will be used for its simplicity, robustness, effectiveness and ease of maintenance.

7.0 Electrical Design

The electrical design criteria apply to all design procedures implemented during the Project design. Electrical design considerations listed in this section include detailing of electrical components, material selection, and design requirements that are intended to be incorporated into the Project.

7.1 Applicable Codes and Standards

Applicable codes and standards are listed in Table 7-1.

Table 7-1. Electrical Codes and Standards

Code	Standard
NFPA 70	National Electrical Code
NFPA 70E	National Electrical Safety Code (NESC)
NFPA 110	Standard for Emergency and Standby Power Systems
IEEE	Institute of Electrical and Electronics Engineers
NEMA	National Electrical Manufacturers Association

NFPA – National Fire Protection Association

7.2 Materials

Materials are summarized in Table 7-2.

Table 7-2. Electrical Materials

Material	Standard
Circuit Breakers	NEMA AB 1, UL 489
Switches	NEMA KS 1, UL 98
Terminal Blocks	UL 1059
Power Conductors/Cable	NEMA WC 70, UL 44, UL 83, UL 854
Instrumentation Cable	NEMA WC 57, UL 13, UL 44
Boxes and Enclosures	NEMA 250

Material	Standard
Raceway	NEMA C80.1, NEMA C80.6, NEMA RN 1, UL 6, UL 360, UL 514B, UL 651, UL 1242
Standby Generators	NEMA MG 1, UL 142, UL 508, UL 1236, UL 2200
Transfer Switches	NEMA ICS 2, UL 1008
Grounding and Bonding Equipment	UL 467

NEMA – National Electrical Manufacturers Association

7.3 Design Loads

7.4 Power Distribution

The gate hoist motor will run on single phase 240 VAC and will be served from a 240V panelboard. A surge protective device will be provided at 240V and 120V to protect the system from transient surges. Power will be provided to the dam via buried 7,200V cable from the nearest transmission line located approximately 2,500 feet north of the site. A 7,200V / 240VAC single phase stepdown transformer will be located at the right abutment of the dam.

7.5 Process Instrumentation and Control

A SCADA system will be implemented to supervise and control the Eklutna Dam spillway gate hoist and to monitor water surface elevation within Eklutna Lake using the level transducer installed as part of the prior dam outlet modification work. The SCADA system will consist of a metal backplane in a local control panel with components mounted to it. This includes PLC and I/O modules, UPS, control power supply and distribution block, control relays, terminal blocks, overcurrent protection, digital communication hardware, and other required appurtenances. It is presumed that datalogging will be performed on the Eklutna Power Plant SCADA system. If autonomous and more continuous datalogging is determined to be required, a datalogging-capable HMI will be specified in addition to the above components.

A fiber optic communication network will be implemented between all systems of the Project via a fiber optic infrastructure. The dam outlet gate and level transducer will connect to a fiber optic communication network between Eklutna Dam, the Eklutna River Release Facility, and the Eklutna Power Plant. Digital communication protocol will be Ethernet/IP over single-mode fiber optic cable (OS2). All new segments of installation will consist of fiber optic cable that will be all-dielectric, loose-tube buffered, with water-repellant gel-fill and jacket rated for direct-bury. For adequate spares to mitigate strand failure, 24-strand cable is proposed. The

cable will be installed in HDPE SDR-11 smooth wall conduit. The fiber optic line will be brought to the LCP housed fiber connector housing for termination, then patched to the managed Ethernet switch in a loop configuration. All strands of all fiber optic cables shall be terminated and certified to the OTDR and OLTS tests. The Ethernet switch will connect the PLC to the communication system.

Field instrumentation consists of the following, as provided in Table 7-3.

Table 7-3. Field Instrumentation

Instrument Tag ISA)	Instrument Type	Parameters	Control Loop
LE-100	Pressure Transducer	Water Level Monitoring, 0-30 ft H_20 range	Measure Water Level in Stilling Well within Eklutna Dam Spillway
HOI-100	Electric Motor Hoist	Hoist Position	Measure Status of Encoder and Position of Gate

OCPD	OVER CURRENT PROTECTION DEVICE
OD	OUTSIDE DIAMETER
OH	OVERHEAD
OPNG	OPENING
OPP	OPPOSITE
OPT	OPTIONAL
ORD	OVERFLOW ROOF DRAIN
ORIG	ORIGINAL
OVFL	OVERFLOW
OVHG	OVERHANG
OZ	OUNCE
P	PAINT, PROCESS (DWG DISCIPLINE)
PAR	PARALLEL, PARAPET
PB	PANIC BAR, PULL BOX
PBD	PARTICLE BOARD
PC	POINT OF CURVE, PIECE, PRECAST
PCC	POINT OF COMPOUND CURVATURE
PCF	POUNDS PER CUBIC FOOT
PCT	PERCENT
PE	PLAIN END
PED	PEDESTAL
PEN	PENETRATION
PERF	PERFORATED
PERM	PERMANENT
PERP	PERPENDICULAR
PF	POWER FACTOR
PH	PHASE
PI	POINT OF INTERSECTION
PKG	PACKAGE
PL	PLATE, PROPERTY LINE
PLBG	PLUMBING
PLF	POUNDS PER LINEAR FOOT
PNEU	PNEUMATIC
POL	POLISH
POS	POSITIVE, POSITION
PP	POLYPROPYLENE, POWER POLE
PRC	POINT OF REVERSE CURVATURE
PREF	PREFINISHED
PREFAB	PREFABRICATED
PRELIM	PRELIMINARY
PREP	PREPARE
PRES	PRESSURE
PROP	PROPERTY
PROT	PROTECTION
PSF	POUNDS PER SQUARE FOOT
PSI	POUNDS PER SQUARE INCH
PSIA	POUNDS PER SQUARE INCH ABSOLUTE
PSIG	POUNDS PER SQUARE INCH GAGE
PT	POINT, POINT OF TANGENCY
PTN	PARTITION
PVC	POLYVINYL CHLORIDE
PVMT	PAVEMENT
PWD	PLYWOOD
PZ	PIEZOMETER
Q	RATE OF FLOW
QTR	QUARTER
QTY	QUANTITY
QUAL	QUALITY
R&R	REMOVE AND REPLACE
R&S	REMOVE AND SALVAGE
R	RADIUS, REGISTER, RISER
RA	RETURN AIR
RB	RESILIENT BASE, ROCK BERM
RCPT	RECEPTACLE
RD	ROOF DRAIN
REC	RECESS
RECD	RECEIVED
RECT	RECTANGULAR
RED	REDUCER
REF	REFERENCE
REINF	REINFORCING
REQD	REQUIRED
RESIL	RESILIENT
RET	RETAINING, RETURN
REV	REVISION, REVERSE
RFL	REFLECTED, REFLECTOR
RGS	RIGID GALVANIZED STEEL
RH	RELIEF HOOD, RIGHT HAND, RELATIVE HUMIDITY
RL	REQUIRED LAP
RND	ROUND
RNG	RENEWABLE NATURAL GAS
RO	ROUGH OPENING
ROW	RIGHT-OF-WAY
RPM	REVOLUTIONS PER MINUTE
RR	RAILROAD
RT	RIGHT
S	SOUTH, SINK, STRUCTURAL (DWG DISCIPLINE)
SA	SUPPLY AIR
SAN	SANITARY
SC	SOLID CORE
SCH	SCHEDULE
SCHEM	SCHEMATIC
SCRN	SCREEN
SE	STEEL/ALUMINUM EDGE
SEC	SECONDARY, SECONDS
SECT	SECTION
SEP	SEPARATE
SF	SQUARE FOOT
SH	SHOWER
SHT	SHEET
SHTG	SHEATHING

VB	VAPOR BARRIER, VINYL BASE, VALVE BOX
VC	VERTICAL CURVE
VCT	VINYL COMPOSITION TILE, VERTICAL CENTERLINE
VEL	VELOCITY
VENT	VENTILATION
VERT	VERTICAL
VS	VERSES, VAPOR SEAL
VOL	VOLUME
VPC	VERTICAL POINT OF CURVATURE
VPI	VERTICAL POINT OF INTERSECTION
VPT	VERTICAL POINT OF TANGENCY
VTR	VENT THROUGH ROOF
VWC	VINYL WALL COVERING
W/	WITH
W/O	WITHOUT
W	WATT, WEST, WIDE, WINDOW, WIRE, WIDE FLANGE BEAM
WC	WATER CLOSET, WATER COLUMN
WD	WIDTH
WF	WIDE FLANGE, WASH FOUNTAIN
WG	WIRE GLASS, WATER GAGE
WH	WALL HYDRANT, WEEP HOLE
WL	WATER LEVEL
WLD	WELDED
WM	WIRE MESH
WP	WATERPROOF, WORKING POINT
WTHP	WEATHERPROOF
WS	WATERSTOP, WATER SURFACE
WSEL	WATER SURFACE ELEVATION
WT	WEIGHT, WATER TIGHT
WWF	WELDED WIRE FABRIC
XS	EXTRA STRONG
XXS	DOUBLE EXTRA STRONG
XSECT	CROSS SECTION
YH	YARD HYDRANT
YS	YIELD STRENGTH

GENERAL NOTES:

1. THESE ABBREVIATIONS APPLY TO THE ENTIRE SET OF CONTRACT DRAWINGS.
2. LISTING OF ABBREVIATIONS DOES NOT IMPLY ALL ABBREVIATIONS ARE USED IN THE CONTRACT DRAWINGS.
3. ABBREVIATIONS SHOWN ON THIS SHEET INCLUDE VARIATIONS OF THE WORD. FOR EXAMPLE, "MOD" MAY MEAN MODIFY OR MODIFICATION; "INC" MAY MEAN INCLUDED OR INCLUDING; "REINF" MAY MEAN EITHER REINFORCE OR REINFORCING.
4. SCREENING OR SHADING OF WORK IS USED TO INDICATE EXISTING COMPONENTS OR TO DE-EMPHASIZE PROPOSED IMPROVEMENTS TO HIGHLIGHT SELECTED TRADE WORK. REFER TO CONTEXT OF EACH SHEET FOR USAGE.

GENERAL STRUCTURAL NOTES:
THE FOLLOWING NOTES ARE GENERAL AND APPLY TO THE ENTIRE PROJECT, UNLESS SPECIFICALLY NOTED OTHERWISE (UNO)

1) GENERAL:

A. CONSTRUCTION DOCUMENTS:
   1. THE CONTRACTOR SHALL REVIEW THE APPROVED CONTRACT DOCUMENTS AND NOTIFY THE ENGINEER OF ANY ERRORS OR DISCREPANCIES PRIOR TO THE START OF CONSTRUCTION.
   2. THE CONTRACTOR SHALL NOTIFY THE OWNER IMMEDIATELY IF ANY UNIDENTIFIED EXISTING UNDERGROUND UTILITIES ARE DISCOVERED.
   3. THE STRUCTURAL CONTRACT DRAWINGS REPRESENT THE FINISHED STRUCTURE. THEY DO NOT INDICATE THE METHOD OF CONSTRUCTION. THE CONTRACTOR SHALL PROVIDE ALL MEASURES NECESSARY TO PROTECT THE STRUCTURE DURING CONSTRUCTION. SUCH MEASURES SHALL INCLUDE, BUT ARE NOT LIMITED TO, BRACING AND/OR SHORING FOR LOADS DUE TO CONSTRUCTION EQUIPMENT, ETC.
   4. UNDER NO CIRCUMSTANCES CAN STRUCTURAL COMPONENTS BE SUBSTITUTED, OMITTED, OR ALTERED FROM THE APPROVED SET OF CONSTRUCTION DOCUMENTS WITHOUT WRITTEN APPROVAL FROM THE ENGINEER.

B. DIMENSIONS AND NOTATIONS:
   1. WRITTEN DIMENSIONS SHALL TAKE PRECEDENCE OVER SCALED DIMENSIONS. DO NOT SCALE DRAWINGS.
   2. ABBREVIATIONS USED ON THE APPROVED CONSTRUCTION DOCUMENTS SHALL BE CONSIDERED TYPICAL ABBREVIATIONS FOR THE INDUSTRY. THE CONTRACTOR SHALL BE RESPONSIBLE TO NOTIFY THE ENGINEER IMMEDIATELY OF ANY ABBREVIATIONS THAT ARE UNKNOWN TO THE CONTRACTOR.

C. TYPICAL NOTES AND DETAILS:
   1. SPECIFIC NOTES AND DETAILS SHALL TAKE PRECEDENCE OVER STANDARD TYPICAL NOTES AND DETAILS.
   2. STANDARD TYPICAL NOTES AND DETAILS ARE TO BE USED WHEN REFERRED TO OR WHEN NO OTHER MORE RESTRICTIVE OR DIFFERENT DETAILS ARE SHOWN ON THE DRAWINGS.
   3. WORK NOT PARTICULARLY SHOWN OR SPECIFIED SHALL BE THE SAME AS SIMILAR PARTS THAT ARE SHOWN OR SPECIFIED.

D. CODE REQUIREMENTS:
   1. ALL WORK SHALL CONFORM TO THE MINIMUM STANDARDS OF REGULATING AGENCIES WHICH MAY HAVE AUTHORITY OVER ANY PORTION OF THE WORK.
   2. SPECIFICATIONS, CODES AND STANDARDS NOTED SHALL BE OF THE LATEST APPROVED ISSUE, INCLUDING SUPPLEMENTS, UNLESS NOTED OTHERWISE.
   3. MINIMUM UNIFORM (BLANKET) ROOF SNOW LOAD, AS DEFINED BY LOCAL BUILDING OFFICIAL OR STATE, SHALL BE DESIGNED FOR, AND IT IS THE RESPONSIBILITY OF THE MBSS ENGINEER TO CONFIRM IF ONE EXISTS BY CONTACTING THE LOCAL BUILDING OFFICIAL.

E. DEFERRED SUBMITTALS:
   1. DEFERRED STRUCTURE SUBMITTAL ITEMS HAVE NOT BEEN PERMITTED UNDER THE BASE BUILDING APPLICATION.
   2. THE CONTRACTOR SHALL SUBMIT COMPONENT SYSTEM DOCUMENTS FOR DEFERRED SUBMITTAL ITEMS, STAMPED BY A PROFESSIONAL ENGINEER LICENSED IN THE JURISDICTION HAVING AUTHORITY, TO THE REGISTERED DESIGN PROFESSIONAL IN RESPONSIBLE CHARGE FOR REVIEW AND FORWARD THE REVIEWED DOCUMENTS TO THE BUILDING OFFICIAL IN COMPLIANCE WITH SECTION 107.3.4.1 OF THE CBC.
   3. DEFERRED SUBMITTAL ITEMS SHALL NOT BE INSTALLED UNTIL THE COMPONENT SYSTEM DOCUMENTS HAVE BEEN APPROVED BY THE BUILDING OFFICIAL.
   4. THE FOLLOWING CONTRACTOR-DESIGNED PROJECT ELEMENTS ARE DEFINED AS DEFERRED STRUCTURAL SUBMITTAL ITEMS:

      PRE-ENGINEERED METAL BUILDINGS

2) CODES, STANDARDS, AND REFERENCES:

A. ASCE 7-16: MINIMUM DESIGN LOADS AND ASSOCIATED CRITERIA FOR BUILDINGS AND OTHER STRUCTURES.
B. ACI 318-14: BUILDING CODE REQUIREMENTS FOR STRUCTURAL CONCRETE.
C. ACI 350-06: CODE REQUIREMENTS FOR ENVIRONMENTAL ENGINEERING CONCRETE STRUCTURES.
D. AISC 360-16 SPECIFICATION FOR STRUCTURAL STEEL BUILDINGS.

3) GRATING:

A. UNLESS INDICATED OTHERWISE, ALL GRATING SHALL BE FAS INDICATED IN THE DRAWINGS, OR APPROVED EQUAL.
B. WEIGHT OF GRATING SECTION SHALL NOT EXCEED 80 LBS.
C. PROVIDE A MINIMUM OF 4 CLIPS PER GRATING PANEL, APPROX 4" FROM PANEL CORNERS.
D. WIDTH OF GRATING SECTIONS SHALL NOT EXCEED 3'-0".
E. SHOP DRAWINGS BASED ON FIELD DIMENSIONS SHALL BE SUBMITTED TO THE ENGINEER PRIOR TO FABRICATION.
F. PROVIDE GRATING FASTENERS AS REQUIRED.
G. THE HORIZONTAL CLEARANCE BETWEEN THE GRATING AND GRATING SUPPORTS SHALL NOT BE LESS THAN ¼" NOR GREATER THAN ½"
H. ALL GRATING SECTIONS, WHEN IN PLACE, SHALL ALWAYS BE FIRMLY ANCHORED TO THEIR SUPPORTS.
I. PROVIDE MINIMUM BEARING PER MANUFACTURERS RECOMMENDATIONS FOR ALL GRATING.

4) NON-SHRINK GROUT:

1. ALL GROUT WORK SHALL CONFORM TO THE LATEST EDITION OF ACI 301.
2. FORMWORK: DESIGN, ERECT, SUPPORT, BRACE AND MAINTAIN FORMWORK TO SUPPORT VERTICAL, LATERAL, STATIC AND DYNAMIC LOADS THAT MIGHT BE APPLIED UNTIL STRUCTURE CAN SUPPORT SUCH LOADS.

5) STRUCTURAL AND MISCELLANEOUS STEEL:

A. STRUCTURAL STEEL SHALL CONFORM TO THE FOLLOWING ASTM STANDARDS:
   a) WIDE FLANGE SHAPES — A992, GR 50 GALV
   b) OTHER SHAPES, PLATES, ANGLES AND BARS — A36 GALV
   c) STEEL PIPE — A53, GRADE B GALV
   d) HOLLOW STRUCTURAL SECTIONS — A500, GRADE B GALV
B. WELDS: PROVIDE 70KSI LOW HYDROGEN ELECTRODE OR PROCESS IN ACCORDANCE WITH AWS A5.1.
C. BOLTS, U.N.O.:
   1. STAINLESS STEEL: ASTM A193, GRADE 8, CLASS 2, AISI TYPE 316
D. DRILL AND EPOXY ANCHOR BOLTS:
   1. STAINLESS STEEL ASTM A193, GRADE 8, CLASS 2, AISI TYPE 316 OR EQUAL APPROVED BY ENGINEER
E. EPOXY BOLT OR EXPANSION BOLT SUBSTITUTIONS FOR EMBEDDED BOLTS IS PROHIBITED WITHOUT WRITTEN CONSENT FROM THE ENGINEER.
F. UNLESS NOTED OTHERWISE ON THE DRAWINGS, ALL EPOXY BOLTS SHALL BE AS SPECIFIED.
G. ALL STRUCTURAL STEEL SHALL BE DETAILED, FABRICATED, AND ERECTED IN ACCORDANCE WITH THE AISC CODE OF STANDARD PRACTICE, EXCEPT AS MODIFIED IN THESE NOTES AND THE PROJECT SPECIFICATIONS.
H. ALL STAINLESS STEEL SHALL BE TYPE 316.
I. SPLICING OF STEEL MEMBERS, UNLESS SHOWN ON THE DRAWINGS, IS PROHIBITED WITHOUT WRITTEN APPROVAL OF THE PROJECT ENGINEER.
J. GALVANIC PROTECTION SHALL BE PROVIDED BETWEEN DISSIMILAR METALS.
K. WELDING SHOWN FOR STAINLESS STEEL ELEMENTS SHALL COMPLY WITH AWS D1.6/D1.6M.

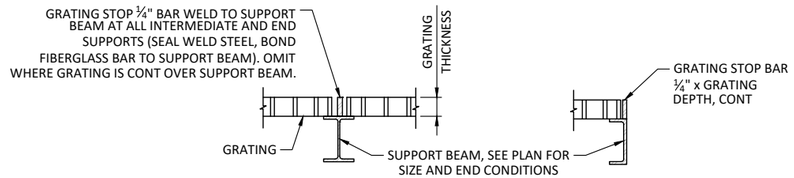
GRATING CLIP DETAIL



GRATING STOP DETAIL

NOTES:
1. UNLESS INDICATED OTHERWISE, ALL GRATING SHALL BE ALUM.
2. GRATING DEPTH TO BE DETERMINED BY MANUFACTURER AND APPROVED BY ENGINEER, UNO.
3. ALL ENDS AND OPENINGS SHALL BE BANDED.
4. WEIGHT OF GRATING SECTION SHALL NOT EXCEED 80 LBS.
5. METAL BEARING BARS SHALL BE DEPTH T x 3⁄16" @ 1 3⁄16" OC.. CROSS BARS SHALL BE @ 4" OC.
6. PROVIDE A MINIMUM OF 4 CLIPS PER GRATING PANEL, APPROX 4" FROM PANEL CORNERS. MAXIMUM CLIP SPACING AT 36" OC.
7. MATERIALS:
   - A. ALUM GRATING - USE ALUM ANGLE SUPPORTS AND SST BOLTS AND CLIPS. IF SUPPORTED BY STEEL BEAMS, USE STEEL STOP BARS. ALUM IN CONTACT WITH CONC OR STEEL SHALL BE COATED PER THE PROTECTIVE COATING SPECS.
   - B. GALV STEEL GRATING - USE STEEL ANGLE SUPPORTS, BOLTS AND CLIPS. GALV AFTER FABRICATION.
   - C. SST GRATING - USE SST ANGLE SUPPORTS, BOLTS AND CLIPS
   - D. FIBERGLASS GRATING - USE FIBERGLASS FOR ALL COMPONENTS EXCEPT DRILLED ANCHORS; ALL CUT EDGES SHALL BE SEALED WITH RESIN; BONDING: USE EPOXY ADHESIVE BONDING AGENT

GRATING FRAME TABLE SIZED TO MATCH GRATING (FOR FIBERGLASS USE CONTINUOUS PROTRUDED FIBERGLASS SEAT & ANCHOR)

DIMENSIONS AND TOLERANCES:

1. UNLESS OTHERWISE NOTED PROVIDE THE FOLLOWING DIMENSIONAL TOLERANCES:

   FRACTIONAL `1/16"
   X `0.06"
   X.X `0.06"
   X.XX `0.010"
   X.XXX `0.002"

2. FEATURES OF PARTS AND ASSEMBLIES THAT ARE IMPLIED AS PARALLEL OR PERPENDICULAR MUST BE PARALLEL OR PERPENDICULAR WITHIN ANGULAR TOLERANCE.
3. INFORMATION, TOLERANCES, AND NOTES ON THIS SHEET APPLY TO ALL MECH. DRAWINGS, UNLESS NOTED OTHERWISE.
4. DIMENSIONS AND TOLERANCE ARE PER ASME Y14.5 UNLESS INDICATED OTHERWISE.
5. CYLINDRICAL LIMITS AND FITS ARE PER ASME B4.1 UNLESS INDICATED OTHERWISE.
6. THREAD CALLOUTS ARE PER ASME Y14.6 UNLESS INDICATED OTHERWISE.
7. SURFACE TEXTURE IS PER ASME B46.1.
8. PROVIDE A MAXIMUM OF 125 MICROINCH SURFACE TEXTURE ON ALL MACHINED SURFACES, UNLESS SHOWN OTHERWISE.
9. LINEAR UNITS ARE FEET AND INCHES OR INCHES AND ALL ANGULAR UNITS ARE DEGREES, UNLESS SHOWN OTHERWISE.
10. BREAK CORNERS AND EDGES, UNLESS SHOWN OTHERWISE.

FABRICATION AND INSTALLATION:

1. FABRICATION OF EQUIPMENT SHALL BE IN GENERAL CONFORMANCE WITH THE LATEST REVISION OF AISC STEEL CONSTRUCTION MANUAL.
2. SURFACE FINISH, WHERE GIVEN, IS ACCORDING TO ANSI B46.1. SURFACES NOT MARKED SHALL HAVE A FINISH OF 250 MICRO-INCHES OR BETTER, EXCEPT FOR SURFACES IN CONTACT WITH GASKETED BEARING SURFACES SHALL BE 125 MICRO-INCHES OR BETTER. NO MACHINING IS REQUIRED IF OTHERWISE FINISHED (ROLLED, CAST, ETC) SURFACE IS BETTER THAN THE INDICATED REQUIREMENTS, EXCEPT IF INDICATED OTHERWISE. SURFACES TO BE MACHINED SHALL INCLUDE ALL SURFACES REQUIRED TO BE PRECISELY ALIGNED INCLUDING BEARING AND SURFACES, BUSHINGS, PINS AND OTHER CRITICAL BEARING SURFACES. SURFACE FINISH IN EACH CASE SHALL BE AS SHOWN ON THE SHOP DRAWINGS. IF NOT SHOWN, THE FINISH SHALL BE SUBJECT TO APPROVAL BY THE DISTRICT.
3. TOLERANCED MACHINE FINISHES TO BE FINAL, AS INSTALLED VALUES, TOLERANCES NOT BE TAKEN PRIOR TO WELDING OR PAINTING.
4. LOCTITE NICKEL ANTI-SEIZE LUBRICANT FORMULA 771 (OR APPROVED EQUAL) SHALL BE APPLIED TO THE THREADS OF ALL FASTENERS PRIOR TO ASSEMBLY TO PREVENT GALLING. TORQUE VALUES USED TO BASED ON LUBRICATED VALUES.
5. DIMENSIONS SHALL BE MEASURED CALIBRATED MEASURING DEVICES SUITABLE FOR DIMENSIONS TAKEN. CALIBRATED TAPE MEASUREMENTS SUITABLE FOR FRACTIONAL DIMENSIONS ONLY. MICROMETERS OR CALIPERS WITH RESOLUTION TO SUITABLE FOR THE TOLERANCE OF THE PART TO BE USED. MAKE CALIBRATION RECORDS AVAILABLE AS REQUESTED BY ENGINEER.
6. LIKE PARTS SHALL BE INTERCHANGEABLE.
7. ROUNDING OF EDGES WHERE SHOWN SHALL BE FULL RADIUS.
8. PROVIDE STAINLESS STEEL SHIMS MEETING ASTM A240 TYPE 304 FOR ALIGNMENT OF MACHINERY. DEBURR ALL SHIMS PRIOR TO INSTALLATION.

FASTENERS:

1. UNLESS NOTED OTHERWISE, MAKE MECHANICAL CONNECTIONS WITH ASTM A449 HEAVY HEX BOLTS, ASTM A563 NUTS, AND ASTM F436 WASHERS. HOT DIP GALVANIZE CARBON STEEL BOLTS, NUTS, AND WASHERS UNLESS OTHERWISE NOTED.
2. USE FASTENERS THAT ARE IN ACCORDANCE WITH THE FOLLOWING DIMENSIONAL STANDARDS:
   A. HEAVY HEX BOLTS PER ASME B18.2.6.
   B. HEX NUTS PER ASME B18.2.6.
   C. PLAIN WASHERS PER ASTM F436.
3. TENSION FASTENERS IN ACCORDANCE WITH THE RESEARCH COUNCIL ON STRUCTURAL CONNECTIONS (RCSC) METHOD FOR TURN-OF-NUT PRETENSIONING. ROTATE NUT AFTER ACHIEVING A SNUG TIGHT CONDITION IN ACCORDANCE WITH RCSC TABLE 8.1
4. HOT DIP GALVANIZE FASTENERS PER ASTM A153. OVERSIZE NUT THREADS PER ASTM A563.

KEYWAYS:

1. MACHINE KEYS AND KEYWAYS PER ANSI B17.1 1967 (R 2017) INCLUDING THE RECOMMENDED CHAMFERS AND FILLETS PROVIDED IN THE STANDARD. SUPPLY KEYS FOR ALL ASSEMBLIES WHERE DIRECTLY INDICATED OR WHERE KEYWAYS ARE SHOWN FOR ONE OR BOTH MATING COMPONENTS.

WELDING:

1. PERFORM WELDING IN ACCORDANCE WITH AWS D1.1. WELDERS AND WELDING PROCEDURES SHALL BE IN ACCORDANCE WITH AWS D1.1. WELDING ELECTRODES SHALL CONFORM TO THE APPROPRIATE AWS SPECIFICATION FOR THE BASE METAL AND WELDING PROCESS USED.
2. PROVIDE WELD ACCESS HOLES TO AVOID INTERSECTING WELDSPER AISC STEEL CONSTRUCTION MANUAL 15TH ED. FIGURE C-J1..2 ALTERNATIVE 1 AND GRIND SMOOTH.
3. GRIND, BLEND, AND DRESS WELDS WITH SURFACE IRREGULARITIES AND SHARP CORNERS TO AVOID STRESS RISERS AND FOR PROPER ADHESION OF THE COATING BEFORE PROCEEDING WITH THE OVERALL SURFACE PREPARATION FOR COATING. REMOVE WELD SPATTER TO ENSURE PROPER ADHESION OF THE COATING. AREAS OF HIGH STRESS AND MACHINED SURFACES SHALL BE PROTECTED FROM WELD SPATTER.
4. CLEAN AND CAREFULLY EXAMINE COMPLETED WELDS FOR INSUFFICIENT THROAT OR LEG SIZES, CRACKS, UNDERCUTTING, OVERLAP, EXCESSIVE CONVEXITY OR REINFORCEMENT AND OTHER SURFACE DEFECTS TO ENSURE COMPLIANCE WITH THE REQUIREMENTS OF AWS D1.1. PERFORM NON-DESTRUCTIVE EXAMINATION BY ULTRASONIC METHOD FOR BUTT WELDS. EXAMINE OTHER WELDS BY DYE PENETRANT (PT) METHOD; MAGNETIC PARTICLE (MT); OR ULTRASONIC TESTING (UT).
5. PERFORM RANDOM SPOT CHECK EXAMINATION OF WELDS AS REQUESTED BY THE ENGINEER AS PART OF THE EQUIPMENT EXAMINATION.
6. PREHEAT THE BASE METAL AS NECESSARY TO MINIMIZE DISTORTION BEFORE WELDING. USE WELD PROCEDURES THAT CONTROL HEAT TO AVOID ADVERSELY AFFECT THE MECHANICALPROPERTIES OF THE BASE METAL. AFTER WELDING IS COMPLETE, STRESS RELIEVE WELDMENTS BY HEAT TREATMENT IN ACCORDANCE WITH AWS D1.1. USE PROPER RESTRAINT AND SUPPORT DURING HEAT TREATMENT TO MINIMIZE DISTORTION.

COMPONENT NAMING:

1. HOIST COMPONENT NAMING HAS BEEN PROVIDED WITH THE FOLLOWING NAMING CONVENTION:

   [GATE]-[MECH COMPONENT ABBR]-[COMPONENT NUMBER]

MECHANICAL COMPONENT ABBREVIATIONS

FIRST LETTER SUFFIX OF IEEE DEVICE DESIGNATION

A	GOVERNOR SYSTEM (OR ACTUATOR SYSTEMS - GATES)
B	BATTERY CHARGING AND MONITORING SYSTEM OR BUS
C	HIGH-VOLTAGE CABLE SYSTEM OR CLOSING RELAY/CONTACTOR
D	DATA ACQUISITION SYSTEM
E	EXCITATION SYSTEM INCLUDING TRANSFORMER AND REGULATOR BUT NOT MAIN FIELD
F	FIRE AND CO2 SYSTEM
G	MAIN GENERATOR INCLUDING AUXILIARY SYSTEMS OR GROUND
G/M	GENERATOR MOTOR INCLUDING AUXILIARY SYSTEMS IN PUMPED STORAGE APPLICATIONS
H	TURBINE OR MAIN PUMP INCLUDING AUXILIARY SYSTEMS
I	ISOLATED AND OTHER POWER BUS SYSTEMS (NOT HIGH VOLTAGE CABLE)
J	POWER CIRCUIT BREAKER INCLUDING AUXILIARY SYSTEMS
K	POWER TRANSFORMER INCLUDING AUXILIARY SYSTEMS
L	ANNUNCIATOR SYSTEM, SECURITY SYSTEM, LINE, OR LOWERING RELAY/CONTACTOR
M	MAIN PUMP MOTOR INCLUDING AUXILIARY SYSTEMS AND VARIABLE SPEED DRIVE
N	AIR (PNEUMATIC) SYSTEM OR NEUTRAL
O	OPENING RELAY/CONTACTOR
P	PENSTOCK OR DISCHARGE LINE SYSTEM
Q	OIL STORAGE, HANDLING, PURIFICATION SYSTEM
R	FIELD FLASHING SYSTEM, PHASE REVERSAL SWITCH INCLUDING AUXILIARY SYSTEM, OR RAISING RELAY/CONTACTOR
S	STATION SERVICE SUBSTATION SYSTEM INCLUDING ENGINE/GENERATOR SYSTEM
T	TONE AND TRANSFER TRIP SYSTEM OR TRANSFORMER
U	UNIT CONTROL CIRCUIT SYSTEM OR UNINTERRUPTIBLE POWER SUPPLY SYSTEM
V	INTAKE AND/OR DISCHARGE VALVE SYSTEM
W	WATER SYSTEMS INCLUDING INTAKE/OUTLET WORKS AND PLANT WATER AND SUMP SYSTEMS
X	DEFINED FOR SYSTEMS UNIQUE TO A FACILITY
Y	DEFINED FOR SYSTEMS UNIQUE TO A FACILITY
Z	DEFINED FOR SYSTEMS UNIQUE TO A FACILITY

SECOND AND SUBSEQUENT LETTER SUFFIXES OF THE IEEE DEVICE DESIGNATION

A	ABNORMAL, A.C., ACCELERATION, ADMISSION, ALARM, AMPERES, AUTOMATIC, AUXILIARIES, PHASE A, ECT.
B	BACKUP, BEARING, BLOCK, BLOWER, BOOSTER, BRAKES, BUS, BUTTON, BYPASS, PHASE B, ETC.
C	CABLE, CARRIER, CHARGER, CHECK, CHLORINATION, CLOSE, COLLECTOR, COMMON, COMPENSATOR, COMPRESSOR, CONTROL, COOLING, CURRENT, CYCLE, CYLINDER, PHASE C, CONVEYOR, ECT.
D	D.C, DECELERATION, DELAY, DEPRESS, DETECTOR, DIELECTRIC, DIFFERENTIAL, DISCHARGE, DISCONNECT, DISCORDANCE, DOMESTIC, DOWN, DOWNSTREAM, DRAFT TUBE, DRAIN, ETC.
E	EJECTOR, ELEVATOR, EMERGENCY, EXPLOSIVE, ETC.
F	FAILURE, FAN, FAULT, FEEDER, FIELD, FILTER, FIRE, FLAME, FLOW, FOLLOWER, FORWARD, FREQUENCY, FULL, FUMES, FUSE, ETC.
G	GAS, GATE, GATING (SCR), GENERATE, GROUND, GUIDE BEARING, ETC.
H	HALON, HAND, HEAT, HEATER, HIGH, HOIST, HORN, HOT, HOUSING, HYDROPNEUMATIC TANK, ETC.
I	INDICATION, INITIAL, INLET, INOUT, INSTANTANEOUS, INTAKE, INTERFACE, INTERLOCK, INTERRUPT, INVERTER, IONIZATION, ETC.
J	JACKING, JET, ETC.
K	KEY, TRANSFORMER
L	LAMPS, LEFT, LEVEL, LIGHTS, LIMITS, LINE, LIQUID, LOCAL, LOGIC, LOSS, LOUVERS, LOW, LOWER, LUBRICATION, ETC.
M	MAIN, MALFUNCTION, MANUAL, METER, METERING, MOTOR, ETC.
N	NEGATIVE, NETWORK, NEUTRAL, NORMAL, ETC.
O	OPEN, OUTLET, OUTPUT, ETC.
P	PACKING BOX, PARALLEL, PARAMETER, PENSTOCK, PHASE, PHASEBACK, PILOT, PIT, POSITION, POTENTIAL, POTHEAD, POWER, PRESSURE, PRIMARY, PROTECTION, PULSE, PUMP, PURIFICATION, PUSH, ETC.
Q	OIL, ETC.
R	RAISE, REACTOR, RECLOSE, RECORD, RECTIFIER, REED, REFRIGERATION, REGULATE, RELAY, RELEASE, RELIEF, REMOTE, RESERVOIR, RESET, RESISTOR, RIGHT, ROTATION, ROTOR, RUNNER, ETC.
S	SEALS, SECONDARY, SELECTOR, SEWAGE, SHORTING, SHUTDOWN, SIGNAL, SKIMMER, SLUDGE, SMOKE, SOLENOID, SPEED, SPIRAL OR SCROLL CASE, SPLICE, STABILIZER, STANDBY, STARTING, STATOR, STEPPING, STORAGE, STRAINER, SUCTION, SUMP, SUPPLY, SWITCH, SYNCHRONIZING, ETC.
T	TANK, TEMPERATURE, TEST, THERMAL, THRUST BEARING, THYRATRON, TIE, TIME, TRANSDUCER, TRANSER, TRANSMITTER, TRIP, TROUBLE, TRASHRAKE, ETC.
U	UNIT, UNLOADER, UNWATERING, UP, UPPER, UPSTREAM, ETC.
V	VALVE, VARS, VIBRATION. VOLTAGE, ETC.
W	WATER, WATTS, WINDINGS, ETC.
X	AUXILIARY DEVICE, ETC.
Y	AUXILIARY TO DEVICE X, ANTIPUMP RELAY, ETC.
Z	AUXILIARY TO DEVICE Y

ABBREVIATIONS

A, AMP	AMP, AMPERE

AACE International CLASS 4 Cost Estimate - Class 4 estimates are generally prepared based on limited information, and subsequently have fairly wide accuracy ranges. Typically, engineering is 1% to 15% complete. They are typically prepared for detailed strategic planning, business case development, projection screening, alternative scheme analysis, confirmation of economic and technical feasibility, selection of a feasible alternative and preliminary budget approval to proceed to the next stage of the project. Virtually all Class 4 estimates use stochastic estimating methods such as cost/capacity curves and factors, historical data and other parametric and modeling techiques. Expected accuracy ranges are from -15% to -30% on the low side and +20% to 50% on the high side, depending on the technological complexity of the project, appropriate reference information, and other risks. Ranges could exceed those shown in unusual circumstances.

Project: Eklutna Dam Fixed Wheel Gate
Location: Anchorage, AK
Date: 18-Apr-24

Class 4 Engineer's Estimate -- 15% Design

Item	Direction Construction Cost		Amount
01	DIVISION 01 INDIRECTS		$460,000
02	SITE CONSTRUCTION AND ACCESS ROADS		$80,000
03	SPILLWAY MODIFICATIONS		$698,100
04	MECHANICAL EQUIPMENT		$1,275,000
05	ELECTRICAL AND TRANSMISSION		$245,000
	Total Construction Cost		**$2,758,100**
	Overhead		
	GC Overhead and Profit	15.00%	$414,000
	Construction Bonds	1.25%	$40,000
	Total - Overhead		**$454,000**
	Direct Cost Contingency		
	*Overall Project Contingency:	25.00%	$803,000
	Escalation:	0.00%	$0
	Total - Contingency		**$803,000**
	Taxes		
	AK Sales Tax	0.00%	$0
	Total - Taxes		**$0**
	Median Construction Price - Direct and Indirect		**$4,015,100**
	Total Construction Price Range (-30% to +50%)		**$2,810,000 to $6,020,000**

Notes:
All costs based on 2024 Construction Dollars
Does not include: interest during construction, legal, financing, or administration costs.
Costs assume a crane can be located on the dam crest for support of work in spillway.
* Overall Project Contingency is set at 25% due to the current level of project definition and it may be reduced at later stages of design.

Appendix C. Structural Calculations

This page intentionally left blank.

Calculation Cover Sheet

Project: Eklutna Fixed Wheel Gate

Client: Eklutna Fish & Wildlife **Proj. No.:** 24-021

Title: Channel Wall Stability

Prepared By, Name: J.Cirafici

Prepared By, Signature: _____ **Date:** 2/12/2024

Peer Reviewed By, Name: G. Clark

Peer Reviewed, Signature: _____ **Date:** 2/12/2024

McMillen

SUBJECT: Eklutna Fixed Wheel Gate
Eklutna Fish & Wildlife
Channel Wall Stability

BY: J.Cirafici **CHK'D BY:** G. Clark
DATE: 2/12/2024
PROJECT NO.: 24-021

Purpose

The purpose of this calculation is to determine whether the existing reinforcement in the channel was is adequate to resist lateral earth pressures after the ogee is removed. The ogee provides lateral bracing of the channel walls along their bottom halves. When the ogee is removed, the walls are no longer laterally braced and serve essentially as cantilevered retaining walls. The following analysis will determine if they can do adequately.

References

- *ACI 318-19: Building Code Requirements for Structural Concrete*
- *ACI 350-20: Code Requirements for Environmental Engineering Concrete Structures*
- *ASCE 7-22: Minimum Design Loads for Buildings and Other Structures*

General Information

Material Unit Weights

γ_w =	**62.4**	pcf	*Water*
γ_c =	**150**	pcf	*Concrete*
γ_s =	**490**	pcf	*Steel*
γ_{soil} =	**130**	pcf	*Soil (Saturated)*

Channel Wall Geometry

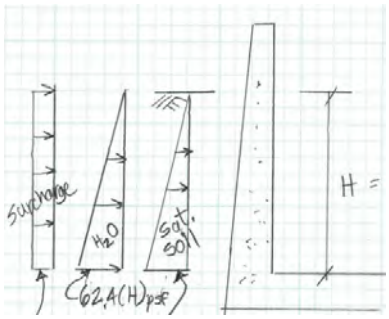
T.O Wall =	**885**	ft	*Top of Wall Elevation*
T.O. Slab =	**852**	ft	*Top of Slab Elevation*
B.O. Slab =	**849**	ft	*Bottom of Slab Elevation*
T.O. Soil =	**879.6667**	ft	
H_{wall} =	**36**	ft	*Height of Wall*
H_{soil} =	**27.667**	ft	*Height of Retained Soil*
t_{wtop} =	**18**	in	*Wall Thickness @ Top*
t_{wbott} =	**36**	in	*Wall Thickness @ Bottom*

**Note: Soil Elevation Varies along length of wall. The channel wall is braced laterally by a top slab starting @ Sta. 4+57.33 and by a vertical shaft @ approx. Sta. 4+45.17. The center point between these two bracing points will be considered for design for the closest approximation of pure cantilever action.*

Soil Properties (Assumed)

ϕ =	**30**	deg	*Friction Angle*
K_0 =	**0.500**		*At-Rest Pressure Coeff*
K_a =	**0.333**		*Active Pressure Coeff (Rankine)*
K_p =	**3.000**		*Passive Pressure Coeff (Rankine)*

Loads



Lateral Earth Pressure

*Wall is assumed to be designed as non-yielding, therefore at-rest pressures will be considered

σ_0 =	**935.133**	psf	*At-rest Lat. Earth Pressure @ Base*
σ_w =	**1726.400**	psf	*Lat. Water Pressure @ Base*
σ_{sur} =	**100.0**	psf	*Assumed Surchage Pressure for Construction/Maintenance*
LRFD Factor =	**1.6**		*ACI350 9.2*

Wall Strength Check - Cantilever Action

Assumed Concrete Properties:

f'_c =	4000	psi	*Concrete Compressive Strength*
f_y =	60000	psi	*Reinforcement Yield Strength*

**Since wall is battered, effective depth of reinforcement. Wall bending capacity will be checked at multiple points along height of wall. The wall will be analyzed in representative 1-ft segment idealized as a singly-reinforced rectangular section.*

Cover =	2	in	*Minimum concrete cover*
β_1 =	**0.85**		*ACI350 Section 10.2.7.3*
β =	EQ 10-6		*ACI350 Strain gradient amplification factor per 10.6.4.4*
Exposure:	Normal		*ACI350 Section 10.6.4.5*
Exposure Factor =	**320**		
Element action:	One-way		
Stress Limit =	**20000**	psi

Even when considering all layers of reinforcement, the bending moments encountered at the base of the wal still exceed its capacity. As such, struts are recommended at the top of the wall so that the wall functions in simple support bending as opposed to cantilevered action.

Wall at Chamber Opening:

**There is an opening in the south side wall that allows access into the ogee. For the purpose of analysis, load imparted onto the wall above and below the openings are assumed to be resisted by 3-ft segments of the wall directly adjacent to the opening on both sides. A factor of 1.83 has been applied to the loads to account for the 5-ft opening width distributed to the adjacent segments.*

While the base of the wall is now adequate when the wall is considered fixed-pinned, the new moment distribution means the inside face reinforcement is the primary tension reinforcement along the top 2/3 of the wall. This inside face is less heavily reinforced than the outside face, thus limiting the bending capacity.

Wall at Chamber Opening:

**There is an opening in the south side wall that allows access into the ogee. For the purpose of analysis, load imparted onto the wall above and below the openings are assumed to be resisted by 3-ft segments of the wall directly adjacent to the opening on both sides. A factor of 1.83 has been applied to the loads to account for the 5-ft opening width distributed to the adjacent segments.*

	Eklutna Spillway Modifications	**DATE:** 4/19/2024	
	Gate Rating Curve	**PROJECT NO.:** 21-024	

Purpose

The purpose of this calculation sheet is to develop a preliminary gate rating curve for the proposed fixed wheel gate within the Eklutna Dam Spillway.

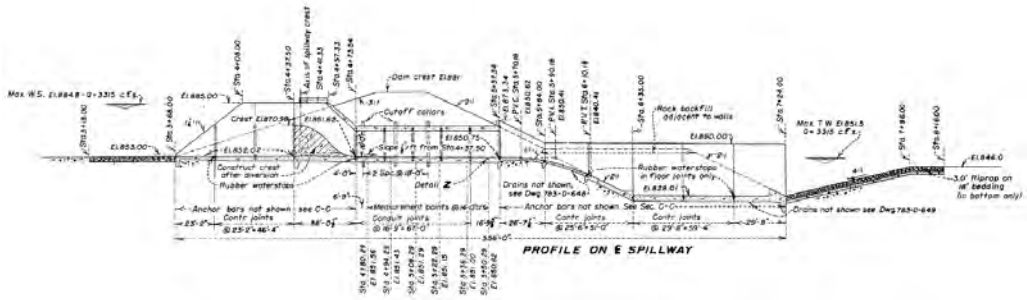
Information - Input

Dimensions and elevations of the spillway are obtained from the As-Built Drawings. Eklutna Project - Alaska. Replacement of Eklutna Dam and Spilway. January, 1965.



Calculation

Full Open

Calculations were performed to determine the stage-discharge relationship of the spoillway with the existing ogee crest removed and the gate in the fully open position. The spillway was treated as a concrete culvert utilzing open channel flow equations with a tailwater elevation assumed constant at a crest elevation of 855.09 ft msl (NAVD88)The spillway was treated as a concrete culvert utilzing open channel flow equations with a tailwater elevation assumed constant at a crest elevation of 855.09 ft msl (NAVD88).

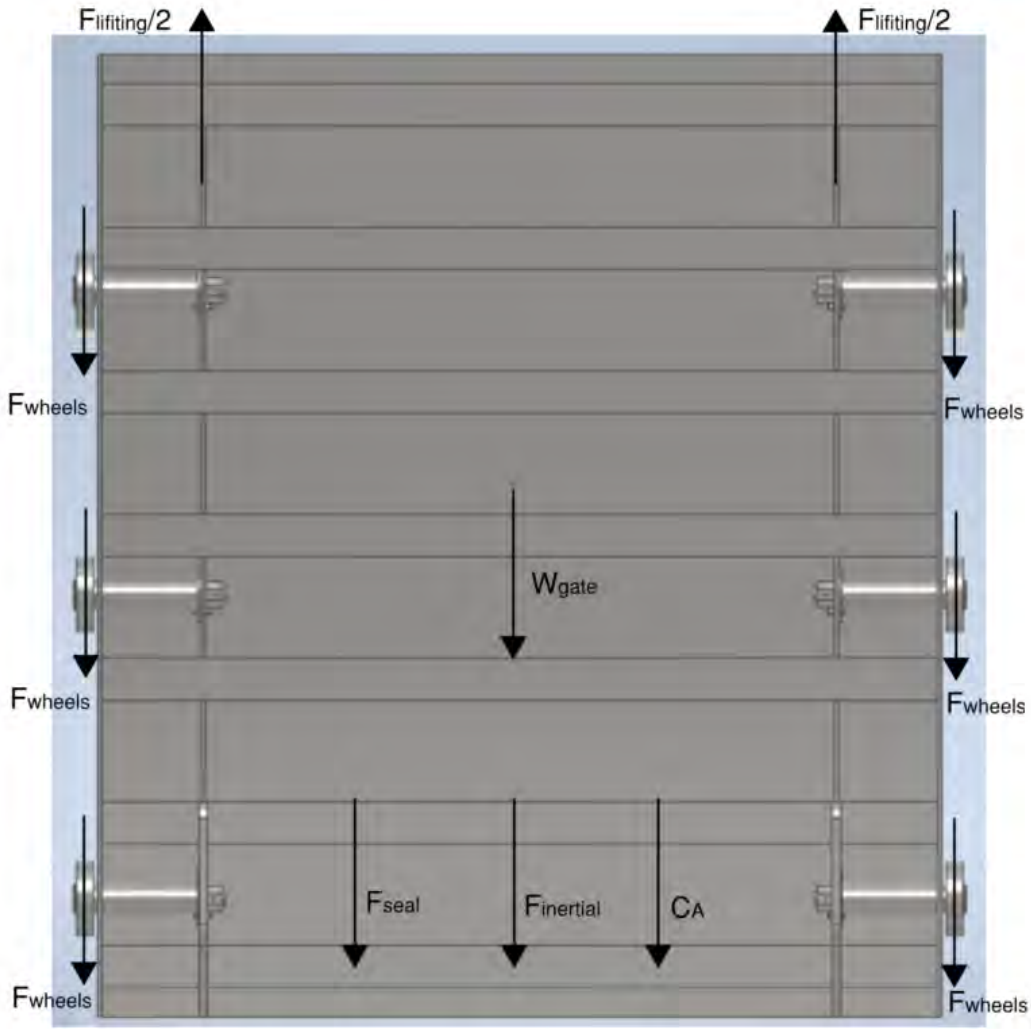
Created By: Anthony DeSantis, EIT Reviewed By:

Gate, Hoist Loading

A) Discussion

This calculation sheet will determine the spillway gate loads imparted to the hoist.



B) Basic Gate Info

Gate width, width of gate subject to hydrostatic pressure, skin width per DWG C-004

$W_{gate} := 16\ ft + 8\ in$

Gate weight with a 10% uncertainty factor

$P_{gate} := 21000\ lbf \cdot 1.10 = 23100\ lbf$

Ice and mud load

$C_A := 1.0\ (2\ kip) = 2\ kip$

For structural load cases, the atmospheric ice load (C) comes from guidance in USACE EM 1110-2-2107 and ASCE 7. These sources typically find the most extreme loading which does not match the "normal operation" scenario intended for load case A. Because the extreme (max) ice loading is used, the ice and mud load will have an uncertainty factor of 1.0.

C) Hydrostatic Loading

Density of Water

$\gamma_w := 62.4 \cdot \frac{lbf}{ft^3}$

Sill Elevation

$EL_{sill} := 855.6 \cdot ft$

Top of Skin PL (max normal water level)

$EL_{pool} := 874.6 \cdot ft$

Head on gate

$h_{eff} := EL_{pool} - EL_{sill} = 19\ ft$

Average Effective pressure on Gate

$p_{eff1} := \gamma_w \cdot \frac{h_{eff}}{2} = 4.117\ psi$

Submerged area of gate

$A_1 := W_{gate} \cdot h_{eff} = 316.667\ ft^2$

Force acting on gate

$F_{hyd} := p_{eff1} \cdot A_1 = 187720\ lbf$

D) Roller Friction Forces

Roller Diameter

$Diam_{roller} := 18 \cdot in$

Bearing Bore Diameter

$Diam_{bearing} := 6.51\ in$

Coef of Friction for Self Lube bushings

$\mu_b := .3$

Frictional Force@ bushing

$F_{friction_axle} := \mu_b \cdot F_{hyd}$

Frictional Force Seen by gate & hoist at full pool

$$F_{friction_wheels} := F_{friction_axle} \cdot \frac{Diam_{bearing}}{Diam_{roller}}$$

$$F_{friction_wheels} = 20368\ lbf$$

Effective COF

$$\frac{F_{friction_wheels}}{F_{hyd}} = 0.109$$

D) Seal Friction

Pressure at the bottom seal

$$P_{seal_bottom} := \gamma_w \cdot h_{eff}$$

Coefficient of friction for the side seals (EM 2701, Section 10.2.9.1.1).

$$\mu_{seals} := 0.5$$

Seal dimensions are assumed for now
Side Seal Thickness

$$t_{seal} := \frac{1}{2} \cdot in$$

Preset Seal Distance (Not available in but this is common value among various projects)

$$\delta_s := \frac{1}{8} \cdot in$$

Typical J-bulb seal are 60-70 on the Shore A durometer scale

$$H_A := 60$$

Distance from inside of skin plate to centerline of J-bulb side seal

$$D_b := 1.23 \cdot in$$

E. Calculate Frictional Force From the Bulb Seals

See LP-212-78 for seal details. The force from side seal friction is defined in EM 2702, 3-4 as:

$$F_{SEALS} = \mu_{SEALS} \cdot S \cdot l + \mu_{SEALS} \cdot \gamma_W \cdot \frac{d}{2}\left(l_1 \cdot \frac{h}{2} + h \cdot l_2 \right)$$

where:

$$S = \frac{3\delta EI}{d^3}$$

Total Length of Both Side Seals:

$$L_{ss} := h_{eff} \cdot 2 = 38\ ft$$

Width of Side Seal exposed to Hydrostatic Pressure [(width of side seal)-(width of backing bar)] (Width of side seal & backing bar

$$d_{ss} := 1.91 \cdot in$$

Modulus of Elasticity for seals. (From Engineering with Rubber, Gent & Campion)

$$E_{seals} := \left(\frac{15.75 + 2.15 \cdot H_A}{100 - H_A} \right) \cdot 1 \cdot MPa$$

Seal Second Moment of Inertia

$$I_{ss} := \frac{L_{ss} \cdot \langle t_{seal} \rangle^3}{12}$$

Force Induced by Pre-setting Side Seal

$$S_{preset_ss} := \frac{3 \cdot \langle \delta_s \rangle \cdot E_{seals} \cdot \langle I_{ss} \rangle}{d_{ss}^{\ 3}} = 134.17 \ \textit{lbf}$$

Side Seal Friction Force (both sides combined)

$$F_{ss} := \langle \mu_{seals} \cdot \langle S_{preset_ss} \rangle \rangle + \left(\mu_{seals} \cdot \langle \gamma_w \rangle \cdot 0.5 \cdot \langle d_{ss} \rangle \cdot L_{ss} \cdot (0.5) \cdot \frac{h_{eff}}{2} \right) = 515 \ \textit{lbf}$$

Conclusion: Assumed bulb seal values show that side seals do not contribute greatly to overall lifting forces.

F. Gate Inertial Loads:

This section will calculate the inertial loads required to accelerate the gate to full speed.

LCA rope velocity. This values is an estimate. The actual gate speed is calculated at the end of this calculation sheet

$$V_g := 2.0 \ \frac{ft}{min}$$

Time for gate to reach full velocity (estimated)

$$t_g := 0.5 \ s$$

Acceleration of the gate from a stop to full speed.

$$A_g := \frac{V_g}{t_g} = 0.067 \ \frac{ft}{s^2}$$

Inertial force to accelerate the gate.

$$F_i := \frac{P_{gate}}{g} \cdot A_g = 48 \ \textit{lbf}$$

G. Combined Lifting Forces - Normal Lifting @ Unusual Water Elevation

$$F_{lifting} := P_{gate} + F_{friction_wheels} + F_{ss} + C_A + F_i = 46031 \ \textit{lbf}$$

H. Hoist Load Evaluation:

This section evaluates the percent that each load contributes to the total hoist load

Percent that each force contributes to the hoist load

Weight of Gate	Ice and Mud:	Seal Friction	Roller Friction	Inertial Load
$P_{gate} = 23.1$ ***kip***	$C_A = 2.0$ ***kip***	$F_{ss} = 0.52$ ***kip***	$F_{friction_wheels} = 20.37$ ***kip***	$F_i = 47.86$ ***lbf***
$\frac{P_{gate}}{F_{lifting}} = 50.2\%$	$\frac{C_A}{F_{lifting}} = 4.3\%$	$\frac{F_{ss}}{F_{lifting}} = 1.1\%$	$\frac{F_{friction_wheels}}{F_{lifting}} = 44.2\%$	$\frac{F_i}{F_{lifting}} = 0.1\%$

Find the difference between gate gravity loads (D) and friction loads (F_{SS} + F_{RF}):. To lower under the influence of gravity the gate gravity loads will need to be larger than the friction loads. The ice and mud load will not be included here because for most operations it will not be applied to the gate. A positive value means the gate will lower under it's own weight.

$$P_{gate} - \left(F_{ss} + F_{friction_wheels}\right) = 2.2 \text{ kip}$$

Load Case A (Normal Lifting) Calculation

A) Discussion

The loads required to lift a spillway gate are a function of the external loads applied to the gate (hydrostatic forces, gravitational forces, friction forces, etc). To calculate the loads at Load Case A, (Normal Operating Condition, NOC, split 50/50 across both hoists) to hoist the Eklutna hoist gate, a free body diagram will be created per Part 1. Operating loads will be applied and the tension in the hoist ropes will be solved. The hoist tension in the wire ropes should experience the largest load at the instant the gate is being lifted from the closed position with a full pool. The assumption with this approach is that a discrete instant of time is utilized in order to account for the inclusion of dynamic forces (side seal and bearing friction). While this is not a true dynamic analysis, performing the calculation at the worse case scenario at its particular instant will yield the most conservative result. This approach has been validated by the inertia calc in Part 1 which indicates that the increase in tension required to bring the gate to full speed is negligible. With the hoist tension known, the torque and speed of the hoisting equipment can be solved for. These torque and speed values will be used to appropriately size equipment for the hoist system.

B) Reference Info

Part 1 - Spillway Gate Loading

C) Hoist Configuration

Lifting Load From Part 1 $F_{lifting} := 46031\ lbf$

Drum Diameter (live wrap) & radius $D_{drum} := 26 \cdot 1.375\ in = 35.75\ in$ $r_{drum} := \frac{D_{drum}}{2} = 17.875\ in$

Reducer Ratios: 250:1 Sumitomo Paramax 9105
60:1 BBB4 Gearmotor

$red_{paramax} := 250$

$red_{BBB} := 60$

$red_{total} := red_{paramax} \cdot red_{BBB} = 15000$

Rope Diameter $D_{rope} := 1.375 \cdot in$

Number of rope parts $n_{parts} := 1$

D) Define Efficiency Losses

Define the mechanical efficiencies of various hoist machinery components

Hoist drum roller bearing efficiency (EM 1110-2-2610-2.1.d):

$\eta_{Hoist_Bearing} := 0.98$

Quadruple reduction parallel shaft reducer efficiency and BBB4 reducer efficiency (see cutsheets):

$\eta_{paramax} := 0.90$ $\eta_{BBB} := 0.90$

System Efficiency $\eta_{system} := \eta_{paramax} \cdot \eta_{BBB} \cdot \eta_{Hoist_Bearing}^{2} = 0.778$

Wire Rope Sizing: Per EM 1110-2-3200

Rope Min Breaking Strength for 1-3/8in 6x37 carbon steel wire rope per ASTM-A1023 is 77.7 ton $MBS_{Rope_.75in} := 77.7\ tonf$

Number of total ropes $n_{ropes} := 2$

EM3200 requires a SF>=5 on rope breaking strength for normal lifting $Q_{Rope_Single_LCA_Allow} := 0.2 \cdot \left\langle MBS_{Rope_.75in} \right\rangle = 31080\ lbf$

Rope Tension (each side) $Q_{Rope_LCA} := \frac{F_{lifting}}{n_{ropes} \cdot n_{parts}} = 23016\ lbf$

Factor of Safey Ropes (over 1 is req'd) $FS_{rope_LCA} := \frac{Q_{Rope_Single_LCA_Allow}}{Q_{Rope_LCA}} = 1.35$

E) Find speed at different locations

Motor RPM $\omega_{motor} := 1760 \cdot rpm$

BBB4 Output Shaft Speed $\omega_{BBB} := \frac{\omega_{motor}}{red_{BBB}} = 29.333\ rpm$

Paramax Output Shaft Speed $\omega_{paramax} := \frac{\omega_{BBB}}{red_{paramax}} = 0.117\ rpm$

Drum Rotational Speed $\omega_{drum} := \omega_{paramax} = 0.117\ rpm$

Gate Travel Speed $V_{gate} := r_{drum} \cdot \frac{\omega_{drum}}{n_{parts}} = 1.098\ \frac{ft}{min}$

Gate Travel Per Rev $D_{rope_drum} := \frac{\pi \cdot D_{drum}}{n_{parts}} = 9.359\ ft$

Gate Travel Per Degree $D_{rope_drum_deg} := \frac{D_{rope_drum}}{360} = 0.312\ in$

F) Find torque at different locations

Torque on Drum (each side)

$$T_{drum_LCA} := Q_{Rope_LCA} \cdot r_{drum} = 34.3 \ kip \cdot ft$$

Torque Output of PARAMAX Red 9105, 250 ratio

$$T_{paramax.out_LCA} := \frac{2 \cdot T_{drum_LCA}}{\eta_{Hoist_Bearing}^{2}} = 71.394 \ kip \cdot ft$$

Torque Input of PARAMAX Red

$$T_{paramax.in_LCA} := \frac{T_{paramax.out_LCA}}{red_{paramax} \cdot \eta_{paramax}} = 317.308 \ lbf \cdot ft$$

Torque Output of BBB4 Red 3hp, 60 ratio

$$T_{BBB_LCA} := T_{paramax.in_LCA} = 317.3 \ lbf \cdot ft$$

Torque Output of Motor

$$T_{motor_LCA} := \frac{T_{BBB_LCA}}{red_{BBB} \cdot \eta_{BBB}} = 5.876 \ ft \cdot lbf$$

G) Find power at different locations

Motor Power Output

$$P_{motor} := \omega_{motor} \cdot T_{motor_LCA} = 1.969 \ hp$$

BBB4 Red Power Output

$$P_{cyclo} := \omega_{BBB} \cdot T_{BBB_LCA} = 1.772 \ hp$$

Paramax Red Power Output

$$P_{paramax} := \omega_{paramax} \cdot T_{paramax.out_LCA} = 1.595 \ hp$$

Drum Power Output

$$P_{drum} := \omega_{drum} \cdot T_{drum_LCA} = 0.766 \ hp$$

Select Motor HP:

$$Power_{motor} := 5 \cdot hp$$

H) Additional component checks

Torque Output after first reducer, motor rated at 250% of rated motor torque

$$T_{brake} := 2.5 \cdot T_{motor_LCA} = 14.69 \ ft \cdot lbf$$

Torque requirement of coupling

$$T_{coupling} := \frac{T_{paramax.out_LCA}}{2} = 428365 \ in \cdot lbf$$

Brake Motor Torque (250% rated torque)

$$T_{brake} := 2.5 \cdot \frac{Power_{motor}}{\omega_{motor}} = 37.302 \ ft \cdot lbf$$

I) Conclusions

1) Wire rope selection of 1-3/8" has 35% remaining capacity than required for normal operation
2) 5hp motor selection is the basis of design
3) 60:1 Primary reducer is the basis of design
4) 150:1 Secondary reducer is the basis of design

Rev: 0 | **Date**: April 17, 2024 | **Description**: Load Case B Calc

Created By: Anthony DeSantis, EIT Reviewed By:

Load Case B (Jammed Gate) Calculation

A) Discussion

The second load case, Load Case B (LCB), represents a gate jammed situation. LCB is comparable to Case 6 as defined in EM 1110-2-2107 Section 13.5.6 Load Combinations. For this load case, it is assumed that the gate has become jammed during operation and the maximum hoisting loads have been applied to the system.

Per the requirements of USACE EM 1110-2-2610 Section 2.1.b.(1), hoist systems will be designed to not exceed 75% of the yield strength of the components under this loading and 70% of breaking strength for the wire rope per Section 2.2.l. In addition, LCB assumes that the hoist load is imbalanced between the sides of the gate with a 70/30 split. The imbalanced loading assumptions are taken from USACE EM 1110-2-2610 Section 9-2.m.(5) that discusses the 70/30 imbalanced loading assumptions.

Electric motors can typically generate 275% to 325% of rated load torque when experiencing a locked rotor condition. Given the gear reduction typically associated with wire rope hoists, even a small motor can apply very large loads to the gate and supporting structure in a locked rotor condition. The maximum allowable overload applied to the gate will be calculated, and load-limiting devices will be incorporated to de-energize the motor at the corresponding output torque. Load limiting devices would consist of a motor control relay that would measure the loads in the drivetrain, with a 150% LCA motor torque cut-out applying to the LCB design limit.

Part 2 - Hoist LCA

C) Hoist Torque and Power

Hoist motor Power $Torque_{motor.LCA} := 5.876\ (ft \cdot lbf)$

NEMA B motor locked rotor torque for a 3hp motor as a % of full load torque
https://www.engineeringtoolbox.com/iec-nema-standards-torques-d_741.html

Motor torque limited to 150% of LCA motor torque $T_{bd} := 150\%$

Motor RPM $\omega_{motor} := 1760\ rpm$

McMillen

PART 3 - EKLUTNA
SPILLWAY HOIST
LOAD CASE B CALCULATION

Motor Limited Torque

$T_{motor} := T_{bd} \cdot Torque_{motor.LCA} = 8.814\ ft \cdot lbf$

Drum Pitch Diameter and radius

$D_{drum} := 35.75\ in$ $r_{drum} := \frac{D_{drum}}{2} = 17.875\ in$

Reducer Ratios: 250:1 Sumitomo Paramax 9105

$red_{paramax} := 250$

60:1 BBB4 Reducer

$red_{BBB} := 60$

BBB4 Red Output Torque (each side)

$T_{BBB_LCB} := T_{motor} \cdot red_{BBB} = 0.53\ ft \cdot kip$

Max Reducer Output Torque
PARAMAX 9105 is rated to $T := 144\ kN \cdot m$
$T = 106.209\ ft \cdot kip$

$T_{paramax_LCB} := T_{BBB_LCB} \cdot red_{paramax} = 132.21\ ft \cdot kip$

Max Rope Force (each side)

$T_{Rope_LCB.70} := \frac{70\% \cdot \left(T_{paramax_LCB}\right)}{r_{drum}} = 62.13\ kip$

$T_{Rope_LCB.30} := \frac{30\% \cdot \left(T_{paramax_LCB}\right)}{r_{drum}} = 26.63\ kip$

Wire Rope Sizing: Per EM 3200

Load Case B allowable tension (EM 1110-2-3200 section 4-5):

Rope Min Breaking Strength for 1-3/8" wire rope

$MBS_{Rope_.75in} := 77.7\ tonf$

Number of total ropes

$n_{ropes} := 2$

EM3200 requires 70% or less for breaking on overload cases

$T_{Rope_Single_LCB_Allow} := .7 \cdot \left(MBS_{Rope_.75in}\right) = 108780\ lbf$

Factor of Safety Ropes (over 1 is req'd)

$FS_{rope_LCB} := \frac{T_{Rope_Single_LCB_Allow}}{T_{Rope_LCB.70}} = 1.751$

Conclusion: 1-3/8" carbon steel IRWC wire rope is adequate for this application.

Extreme Ice Loading Calculation

A. DISCUSSION:

This calculation sheet will find the deep bay hoist system loads under extreme ice loading. Ice loading is found using the method in ASCE 7-22

B. REFERENCES:

- *ASCE* - ASCE 7-22 Minimum Design Loads and Associated Criteria for Buildings and Other Structures

C. EXTREME ICE LOADING:

1. Height above ground. This is taken as the distance from top of the gate in the closed position to the sill elevation assuming there is no tailrace. The tailrace is assumed to be a factor(ASCE - Section 10.4.3):

$$z := 874.6\ ft - 855.6\ ft = 19.00\ ft$$

2. Height factor (ASCE - Eqn. 10.4-4):

$$f_z := \left(\frac{z}{33\ ft}\right)^{0.10} = 0.95$$

3. Ice thickness (Figure 1 & ASCE - Figure 10.4-4D):

$$t := 0.75\ in$$

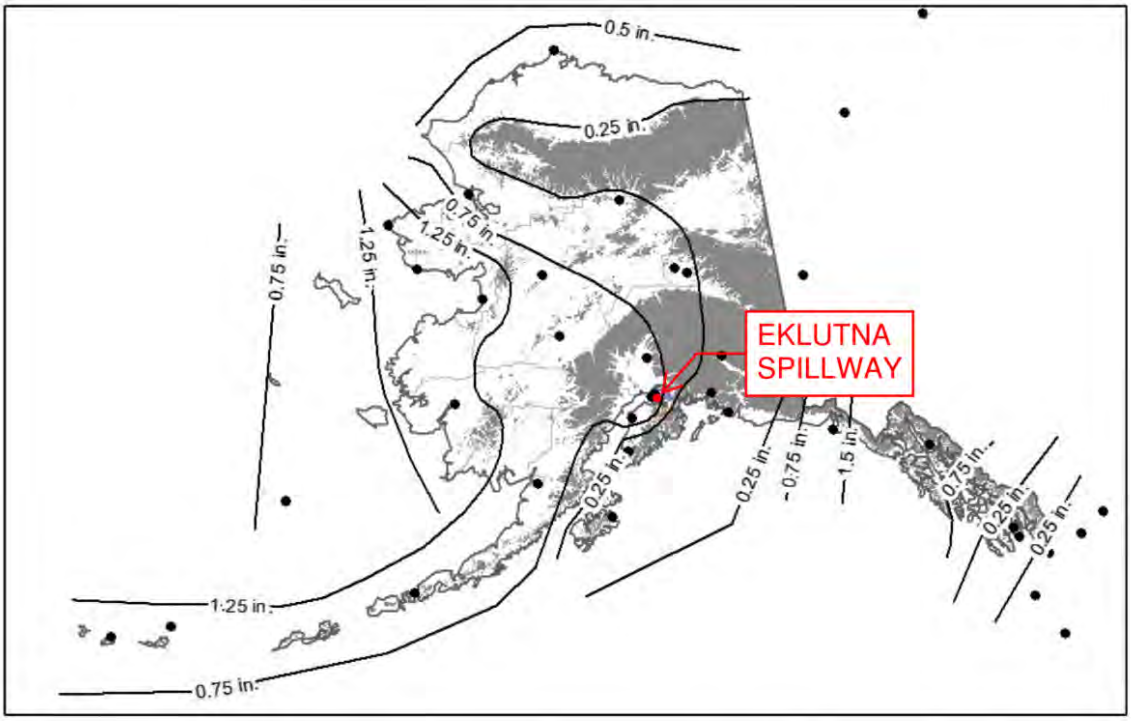

Figure 10.4-3D. Nominal ice thicknesses caused by freezing rain for Alaska for Risk Category IV (1,400-year mean recurrence interval) structures.

Figure 1 - ASCE Ice Thickness for Risk Category IV Structures
(Figure 10.4-3D)

4. Width of gate (from Inventor model):

$$B := 200\ in$$

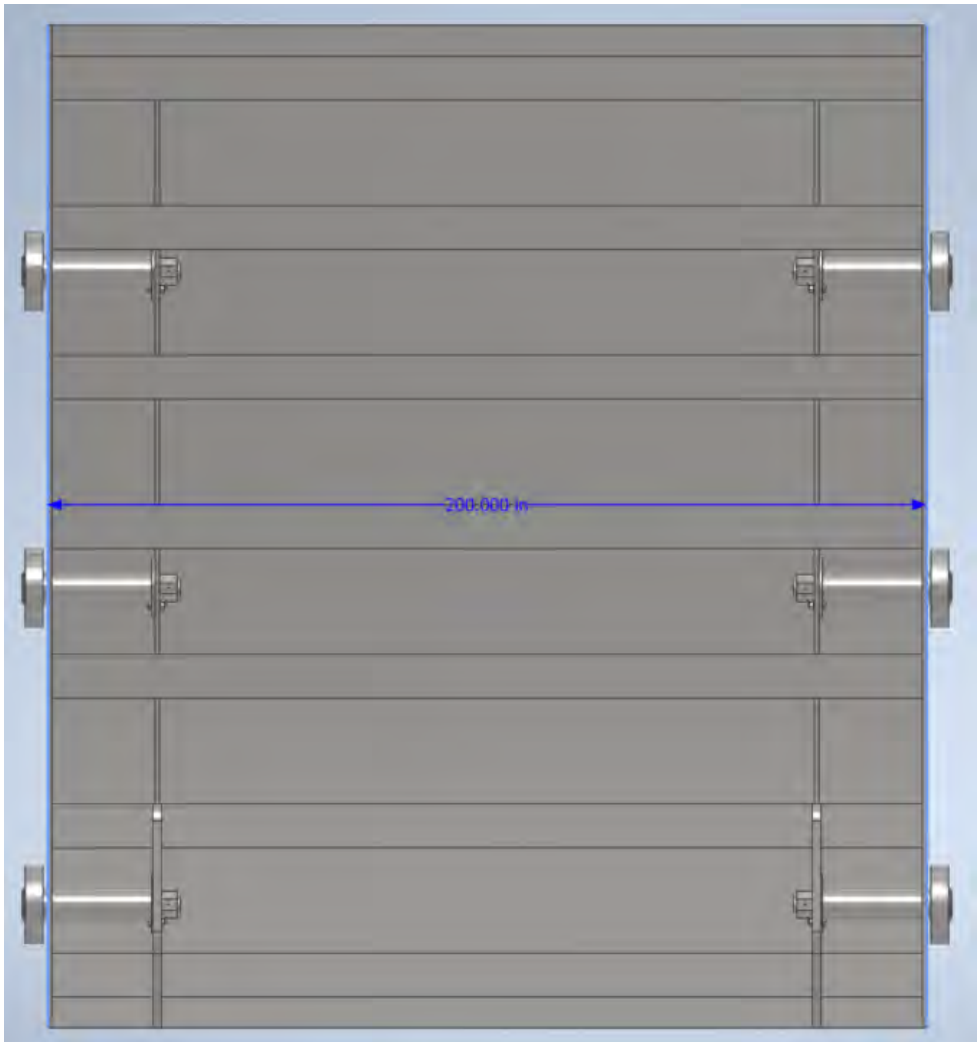

Figure 2 - New Gate Plan and Elevation View Showing Width
(DWG. S111)

5. Design Ice thickness for freezing rain. Deep bay gates do not meet the dimensional conditions of an escarpment. Topographic factor is taken as 1.0 (ASCE - Section 10.4.4 and 26.8.2):

$$K_{zt} := 1.0$$

6. Design Ice thickness for freezing rain (ASCE - Eqn. 10.4.5):

$$t_d := t \cdot f_z \cdot \left(K_{zt}\right)^{0.35} = 0.71\ in$$

7. Deep bay gate characteristic length (Figure 3 & ASCE - Section 10.4-1):

$D_c := 228.77\ in$

Figure 3 - Gate Characteristic Length

8. Volume of freezing rain buildup on deep bay gate:

$V_I := B \cdot \langle D_c \rangle \cdot t_d = 18.8\ ft^3$

9. Ice density (ASCE - Section 10.4.1):

$\rho_I := 56\ \frac{lbf}{ft^3}$

10. Extreme ice load:

$C_A := V_I \cdot \langle \rho_I \rangle = 1.1\ kip$

1.0 Introduction

1.1 Purpose

The purpose of this report is to present the design documentation associated with the development of the Eklutna River Release Facility (ERRF) as part of the Eklutna Fish & Wildlife Program (Project). The design documentation report (DDR) summarizes the pertinent data, design criteria, and standards used as the basis for the 15% level of design of the Project. The DDR documents the data, criteria, and standards by engineering discipline, and provides information about the operation of the design components associated with the Project.

The information presented within this DDR will be updated throughout the design development process to reflect refinement of the Project components and facilities, and advancement of the design analysis and details.

1.2 Location

The Project site is located in Southcentral Alaska approximately 30 miles northeast of downtown Anchorage near the Native Village of Eklutna. The Project footprint spans lands owned and managed by the State of Alaska, Eklutna Inc., and the Bureau of Land Management. As proposed, the Project involves utilizing an existing diversion pipeline, owned and operated by Anchorage Water and Wastewater Utility (AWWU,) to deliver flow into the Eklutna River approximately 1 mile downstream of Eklutna Dam, as shown in Figure 1-1.

1.3 Background and Objectives

As part of the Eklutna Fish & Wildlife Program, Chugach Electric Association, Matanuska Electric Association, and the Municipality of Anchorage, known collectively as the Owners of the Eklutna Hydroelectric Project (Owners) are studying various means of providing water to the Eklutna River to mitigate damages to, and enhance fish and wildlife impacted by development and continued operation of the Project. A measure under consideration by the Owners is the implementation of a new river release structure utilizing some of the infrastructure owned and operated by AWWU. The purpose of this report is to document the design criteria and analyses performed for the engineering development of the Eklutna River Release Facility.

1.4 Report Organization

This DDR is a record of the design effort for the Project and specifically describes the details of the design process and work effort for the Eklutna River Release Facility (ERRF). The DDR

consists of a summary of the design elements, criteria, methods and approach, engineering calculations, and pertinent references. The major report sections and intended purpose are presented in Table 1-1.

Table 1-1. Major Report Sections and Purpose.

Section	Description	Purpose
1	Introduction and Background	Presents the Project background, purpose, location, authorization, objectives, feature scope, and the report organization.
2	General Description	Summarizes the basic design criteria that are used as the basis of design.
3	Existing Infrastructure	Summarizes the existing infrastructure related to the Project
4	Project Infrastructure and Operation	Describes the layout of the Eklutna River Release Facility and its operation.
5	Hydraulic Design	Presents the hydraulic and transient analysis to determine the design of the facility and impacts to existing AWWU infrastructure.
6	Civil Design	Includes information related to the civil design of the Eklutna River Release Facility, including erosion and sediment control measures.
7	Structural Design	Includes information related to the structural design of the Eklutna River Release Facility, including the building and foundation.
8	Mechanical Design	Includes information related to the mechanical design of the Eklutna River Release Facility valves.
9	Electrical Design	Includes information related to the electrical design and instrumentation and controls associated with the Eklutna River Release Facility.
10	References	Documents the references used in developing the design.

2.0 General Description

2.1 General Design Criteria and Standards

General design criteria and standards for the Project include the abbreviations, survey datum, topographic mapping, references, and design standards as described below.

2.1.1 Standard List of Terms and Abbreviations

AACE	Association for Advancement of Cost Engineering
AC	alternating current
ACI	American Concrete Institute
AF	acre-ft
AISC	American Institute of Steel Construction
ANSI	American National Standards Institute
ASTM	American Society of Testing and Materials
AWWA	American Water Works Association
AWWU	Anchorage Water and Wastewater Utility
BMP	Best Management Practice
CADD	computer aided design and drafting
CEA	Chugach Electric Association
cfm	cubic feet per minute
cfs	cubic feet per second
DC	direct current
DDR	Design Documentation Report
ERRV	Eklutna River Release Valve
El.	elevation
fps	feet per second
ft	feet
HDC	Hydraulic Design Criteria
HEC	Hydrologic Engineering Center
HMI	human-machine interface
HPU	hydraulic power unit

HVAC	heating, ventilation, and air conditioning
Hz	hertz
IESNA	Illuminating Engineering Society of North America
I/O	Input/Output
IBC	International Building Code
IEEE	Institute of Electrical and Electronics Engineers
LED	light-emitting diode
LiDAR	Light Detection and Ranging
MEA	Matanuska Electric Association
MGD	million gallons per day
MOA	Municipality of Anchorage
MSL	Mean Sea Level
NAD83	North American Datum of 1983
NAVD88	North American Vertical Datum of 1988
NEC	National Electric Code
NEMA	National Electrical Manufacturers Association
NESC	National Electrical Safety Code
NFPA	National Fire Protection Association
NGVD29	National Geodetic Vertical Datum of 1929
NVE	Native Village of Eklutna
O&M	operation and maintenance
pcf	pounds per cubic foot
PLC	programmable logic controller
psi	pounds per square-inch
SCADA	Supervisory Control and Data Acquisition
UL	Underwriters Laboratories
UPS	uninterruptible power supply
USGS	U.S. Geological Survey
V	volt
WSEL	water surface elevation

2.2 Survey Datum

Multiple vertical survey datums are reported in and around the main features of the Project. The following datums are identified within the Project area:

1. The MOA conducted LiDAR survey flights over the Project Area between May 12-30, 2015. The vertical datum this data is presented in is NGVD 1929 – M.O.A. 1972 Adjustment (MOA72).

2. McMillen contracted NV5 Geospatial to conduct LiDAR survey flights over the Project Area on May 28, 2020 and on May 18, 2022. The vertical datum this data is presented in is NAVD88, GEOID12B.

3. The As-Built Drawings for the intake structure are used for the reservoir modeling and hydraulic analysis. The drawings are titled “Eklutna Project – Alaska; Rehabilitation Pressure Tunnel” dated November 16, 1964 (USBR, Eklutna Project - Alaska. Rehabilitation Pressure Tunnel. As Built Drawings 1964). The vertical datum for these drawings is currently unknown and shall be referred to as “Local Datum” until further information is gathered.

4. The As-Built drawings of the AWWU lake diversion tunnel and pipeline are utilized as part of the design of the proposed facility. The drawings are titled “Eklutna Water Project” dated January 2, 1986 (AWWU, Eklutna Water Project 1986). The vertical datum used in these drawings is the GAAB Post-Quake, USC&GS, MSL, 1972. As currently understood this datum is identical to and used interchangeably with MOA72.

5. The USGS gauge station 15278000 Eklutna Lk Nr Palmer AK is reported by USGS to be based on the NGVD29. Discussions with USGS revealed that this is not necessarily the case, rather the gauge is tied to a brass cap set on the Eklutna Dam spillway wall.

The survey datum that will be utilized as the basis of this Project and the basis of all elevations within this report is NAVD88 GEOID 12B in terms of elevation with respect to Mean Sea level (MSL), US Foot. A conversion was determined from each of the unique project datums to correct to NAVD88 for the purposes of this investigation (McMillen 2022). The calculated correction factors between vertical datums used as part of the Eklutna Project is presented in Table 2-1.

Table 2-1. Eklutna Vertical Datum Conversion.

Vertical Datum	Conversion to NAVD88 (ft)	Notes
NAVD88	+0.00	
USGS Gauge	+3.263	Based on Staff Gauge Measurements at Dam
Local Datum	+3.593	Based on 2003 Survey at Dam
MOA72	+6.339	Based on 1987 Survey at Dam
	+6.520	Based on 2015 MOA LiDAR report

2.3 Geotechnical Data

At the present phase of development of the proposed facilities, site specific geologic and geotechnical investigations have not been performed. The basis of the geotechnical design for the facilities associated with the lake diversion tunnel and portal valve structure is the design summary report for the Eklutna Water Project (AWWU 1985). Additional geotechnical information was obtained for the vicinity around Eklutna Dam from the technical record of design and construction (USBR 1958).

3.0 Existing Infrastructure

3.1 Eklutna Lake

Eklutna Lake is a natural lake formed by the retreating Eklutna glacier. It is approximately 7 miles long, 1 mile wide, and 200 feet deep at its deepest. Eklutna Dam raises the water level of Eklutna Lake by 21 feet to a maximum regulated lake level of El. 874.59 ft (NAVD88). At this elevation, the lake has a surface area of 3,420 acres. The maximum surcharge water surface elevation is 888.39 ft at the peak spillway flow rate of 3,315 cfs. The minimum regulated lake level is El. 817.59 ft, which provides an active storage capacity of 174,800 acre-feet. The average monthly water surface elevation of Eklutna Lake is presented in Table 3-1.

Table 3-1. Average Monthly Water Surface Elevation of Eklutna Lake; 2011 - 2022.

Month	Average WSL (ft)
Jan	857.4
Feb	852.4
Mar	846.8
Apr	840.0
May	835.2
Jun	837.8
Jul	851.1
Aug	864.3
Sep	870.1
Oct	869.8
Nov	866.3
Dec	861.7

3.2 Intake Structure

Water from Eklutna Lake is currently diverted for power generation and/or water supply purposes through a submerged intake structure located on the northern end of the lake approximately 4,500 feet northeast of Eklutna Dam. The intake structure was originally constructed in 1952 and was replaced following damage in the 1964 earthquake. The intake consists of a reinforced concrete box structure protected with trash racks on its top, front, and both sides. The intake sits at an invert elevation of El. 794.19 ft and conveys water through to the Project power tunnel.

3.3 Power Tunnel

The power tunnel has an internal diameter of 9 feet and spans a distance of approximately 4.5-miles through Goat Mountain to the Project penstock. The tunnel consists of 225 feet of precast concrete conduit with the remainder being reinforced concrete lined segments. A gate shaft is located approximately 860 feet downstream of the intake to provide isolation of the tunnel for maintenance purposes. A tee was tapped into the tunnel approximately 500 feet downstream of the intake as part of the Eklutna Water Project constructed by AWWU in 1985. The tunnel terminates in a surge chamber located directly over the tunnel prior to entering the Project penstock. The surge chamber is used to dampen pressure surges within the conveyance during operation.

3.4 Penstock

Extending from the surge tank at the end of the tunnel is the penstock, which conveys water to the power plant turbines. The overall length of the penstock is about 1,088 feet. The penstock is a variable-diameter (91, 83, and 75-inch-outside-diameter) welded and coupled steel pipe encased in concrete in a tunnel extending from the surge tank to the power plant. At the powerplant, the penstock bifurcates into two 51-inch-diameter 23-foot-long branches, which are connected to the spiral cases of the turbines. A 66-inch butterfly valve is installed in each penstock branch upstream from the turbines to provide means of unwatering the turbines for servicing or maintenance.

3.5 Eklutna Power Plant

The Eklutna power plant is located on the Old Glenn Highway. It houses two vertical-shaft Francis-style hydroelectric generating units with an installed nameplate capacity of 44.4 MW. Actual capacity is less; the plant is rated at 41.9 MW at high lake elevations and 38.8 MW at low lake elevations. The rated flow through both turbine-generator units combined is 640 cfs, with a maximum allowable flow through the tunnel of 660 cfs. The average flow passing through the plant annually is 320 cfs. The monthly average flow rate through the Eklutna Power Plant from 2011 to 2020 is presented graphically in Figure 3-1.

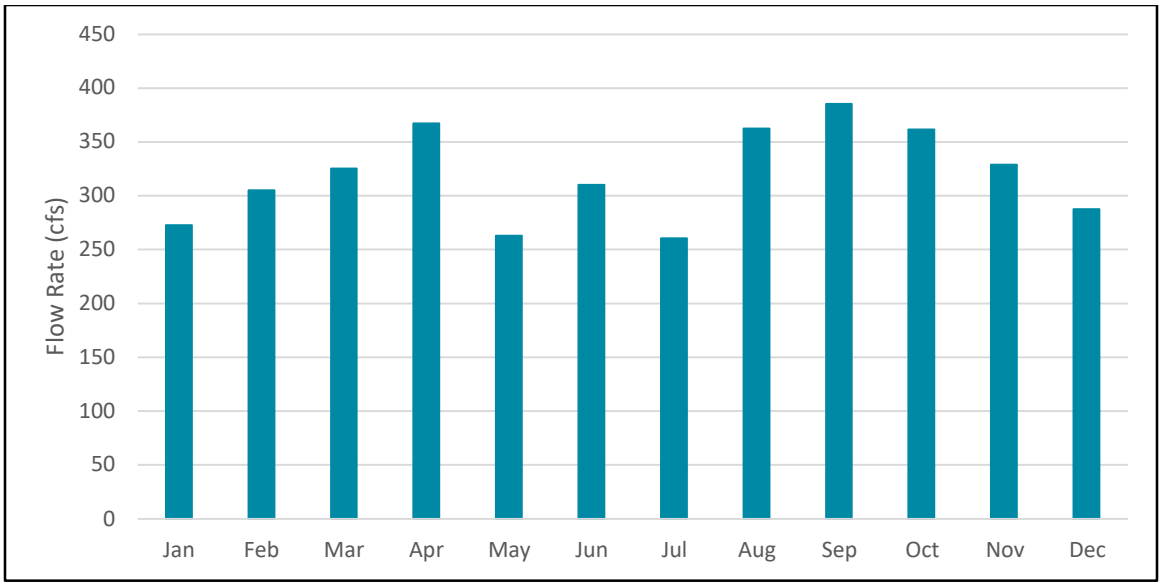

Figure 3-1. Average monthly flow rate; Eklutna Power Plant.

3.6 AWWU Lake Diversion Tunnel

As part of the Eklutna Water Project, AWWU constructed a new diversion tunnel and hydraulic conveyance from Eklutna Lake in 1985 to supply drinking water for the Municipality of Anchorage. The diversion tunnel connects to the Project power tunnel upstream of the tunnel gate shaft via a concrete encased fabricated steel 108-inch x 54-inch tee. The AWWU lake diversion tunnel has an inside diameter of 54-inches for the initial 60 feet, spanning from the tee to the intake valve shaft. The intake valve shaft houses a butterfly valve for emergency closure purposes and a gate valve for tunnel isolation. From the intake valve shaft, the tunnel enlarges to 72-inch diameter and spans a length of approximately 1.6 miles to the terminus of the tunnel approximately 1 mile downstream of Eklutna Dam. At this point the tunnel transitions into a 54-inch diameter steel pipeline and enters the portal valve shaft. The portal valve shaft houses an additional butterfly valve for emergency closure purposes of the AWWU pipeline. Hydraulic criteria of the AWWU lake diversion tunnel is presented in Table 3-2.

Table 3-2. Tunnel Hydraulic Design Criteria.

Description	Value
Inside Diameter (ft)	6
Length (ft)	8,540
Hydraulic Capacity (MGD)	100
Hydraulic Capacity (cfs)	155
Max Design Velocity (ft/s)	5.5
Normal Max Operating Pressure (psi)	42
Test Pressure (psi)	70
Max Allowable Transient Pressure (psi)	75
Maximum Design Pressure (psi)	186

3.7 AWWU Pipeline

The AWWU Pipeline segment P-4 spans from the AWWU portal valve shaft to the Eklutna Water Treatment Facility (EWTF) over a total distance of approximately 6 miles alongside the Eklutna River. The pipeline varies in diameter from 54-inch to 60-inch and is buried to a depth of 6- to 9 feet to the crown of the pipe. The pipeline is a mortar lined and coated steel pipe and contains a cathodic protection scheme consisting of 21 cathodic testing stations spaced at an interval of 1,500 feet. At a location within the Eklutna River valley approximately 6.5 miles downstream of Eklutna Dam, the pipeline is routed approximately 360 feet up the canyon wall to the EWTF located along Eklutna Lake Rd. The hydraulic criteria of the AWWU Pipeline segment P-4 is presented in Table 3-3.

Table 3-3. Hydraulic Design Criteria; AWWU Pipeline.

Description	Value
Inside Diameter (ft)	4.5 / 5
Length (ft)	32,600
Hydraulic Capacity (MGD)	100
Hydraulic Capacity (cfs)	155
Max Design Velocity (ft/s)	9.7 / 7.9

3.8 Eklutna Water Treatment Facility

The EWTF treats all water from Eklutna Lake prior to being discharged to the Municipality of Anchorage and AWWU's water distribution network. The facility is sized to treat a maximum of 63.4 cfs (41 MGD). All water from the pipeline passes through an energy recovery station located at the EWTF, consisting of a 922 HP (690 kW) Turgo-style hydroelectric turbine with the option of bypassing water around the turbine through an energy dissipation sleeve valve. Flow through the facility typically varies from 30-40 cfs (19-26 MGD). The average monthly flow through the EWTF from 2011-2020 is presented in Figure 3-2.

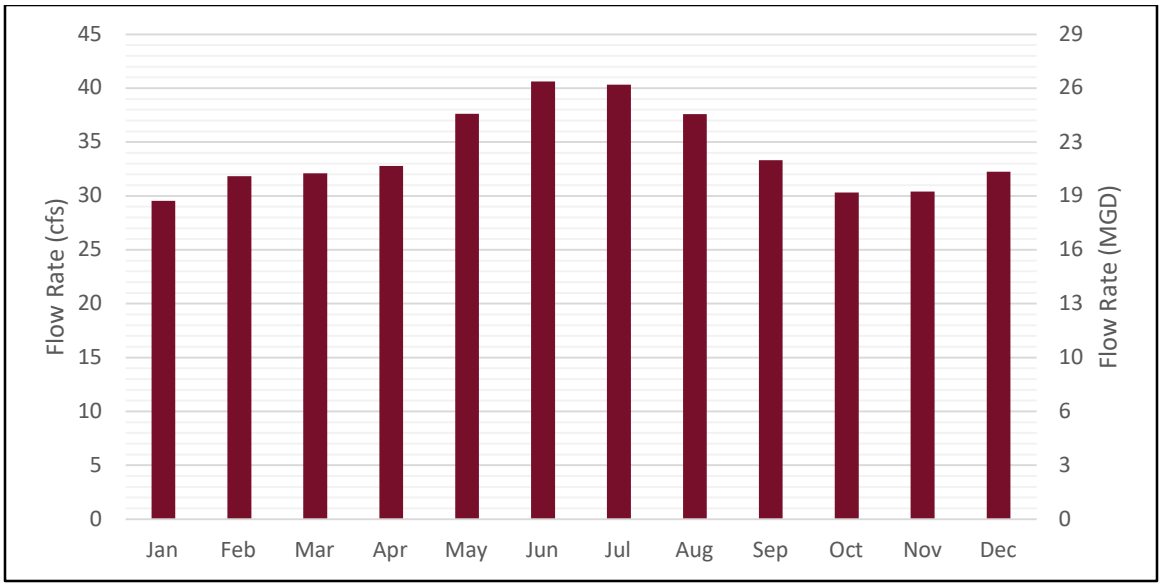

Figure 3-2. Average Monthly Flow Rate - EWTF; 2011-2020.

4.0 Project Infrastructure and Operation

The proposed infrastructural modification for providing continuous, year-round flow from Eklutna Lake to the Eklutna River involves the addition of a new valve and release structure located adjacent to AWWU's portal valve one mile below the Eklutna Dam. The proposed infrastructure, referred to as the Eklutna River Release Facility (ERRF), would consist of a tee off of the existing 54-inch pipeline that diverts water from Eklutna Lake as part of AWWU's Eklutna Water Project and new control valves to bypass water into the Eklutna River. The infrastructure to be included as part of the Eklutna River Release Facility is as follows:

- Construction of a new isolation gate structure immediately upstream of the AWWU portal valve release facility;
- Replacement of approximately 21 feet of existing pipeline with a newly fabricated steel 54-inch x 42-inch tee;
- Installation of a 54-inch gate valve on the main segment of pipe intended to provide dual means of isolation for AWWU's pipeline segment P-4;
- Installation of a 42-inch gate valve on the branch segment intended to provide isolation to the river release structure;
- Installation of a draining and filling system around each isolation valve;
- Installation of a pressure monitoring system and flow meter to provide dual redundant flow monitoring at AWWU's portal release valve facility;
- Construction of a new river release structure approximately 30 feet downstream of the isolation gate structure;
- Installation of a 30-inch sleeve valve or alternative energy dissipation valve to control flow into the Eklutna River;
- Installation of a flow monitoring system to monitor flow releases into the Eklutna River;
- Construction of a bypass channel connecting the river release structure with the Eklutna River;
- Installation of a flow meter at AWWU's intake valve shaft to provide dual redundant flow monitoring;
- Upgrades to communication infrastructure to provide direct communication between the Eklutna River Release Facility, AWWU portal valve shaft, AWWU intake valve shaft, Eklutna Water Treatment Facility, and Eklutna power plant.

4.1 Proposed Instream Flow Releases

The flow releases into the Eklutna River are anticipated to vary seasonally with a winter flow of 27 cfs and a summer flow of 40 cfs with appropriate ramping rates between flow levels. The total volume of water to be released annually from Eklutna Lake into the Eklutna River is 24,280 acre-ft/yr, equivalent to approximately 10% of the average annual inflow to the lake. The seasonal flows released into the river are presented in Figure 4-1 and tabulated in Table 4-1.

4.2 Proposed Channel Maintenance Flow Releases

The proposed channel maintenance flow regime is water equivalent to 220 cfs for 72 hours in 3 out of every 10 years. The channel maintenance flow regime may be provided by natural high flow events over the dam; in the absence of natural high flow events, flow releases to meet the channel maintenance flow regime will be made by releasing up to 80 cfs from the proposed Eklutna River Release Facility and 140 cfs from the Eklutna Dam outlet gate. The proposed channel maintenance flow regime is presented in Table 4-2.

Table 4-2. Proposed Channel Maintenance Flow Regime and Duration.

Flow Duration (hours)	Flow Rate (cfs)
3	150
3	200
36	220
12	200
6	160
6	140
6	110
6	90
6	80
6	70
4	60

The channel maintenance flows must be planned such that the Eklutna Dam Outlet gate is connected to Eklutna Lake and able to provide a minimum of 140 cfs concurrently with the Eklutna River Release Valve (ERRV) providing up to 80 cfs into the river. This requires a water surface elevation of at least 866.6 ft, which typically occurs in mid-August.

4.3 Project Operations

The proposed ERRV and structure will be owned and operated by the Owners with remote control of the proposed valve and monitoring of valve position and flow rate from the Eklutna Power Plant. The Owners would control the valve by making periodic adjustments to valve position to meet the required flow rate based on the monthly flow regime presented in Table 4-1.

Operations and control of the proposed isolation gate structure upstream of the river release structure would be co-owned and operated by both AWWU and the Project Owners. Both isolation gate valves within that structure would normally be left in the open position. The Owners may choose to close the 42-inch gate valve as necessary during maintenance on the river release valve. AWWU may choose to close the 54-inch gate valve to provide a secondary

means of isolation on their portal valve structure if maintenance is required within the portal valve shaft or on the AWWU Pipeline Segment P-4.

The flow meter installed on the main 54-inch line and on the river release bypass would be monitored within the local SCADA system at the Portal Valve Shaft and AWWU's main SCADA controller at the EWTF. The intake emergency shutoff valve must be provided the instantaneous flow rate through the river release bypass to determine whether a change in flow within the conveyance is a result of variations in the river release valve flow rate or whether it constitutes a leak or break within the pipeline. Additionally, the flow monitoring on the river release bypass piping would be monitored by the Owners SCADA system within the Eklutna Power Plant to ensure compliance with the Fish & Wildlife Program.

During channel maintenance flow events occurring 3 times out of 10 years that cannot be met with natural high flow spill events, the Owners are proposing to release up to 80 cfs from the river release valve and 140 cfs from the dam outlet gate for a total of 220 cfs in accordance with the flow regime presented in Table 4-2. This must be timed to occur when the water surface elevation of Eklutna Lake is at or above El. 866.6 ft.

In the event of a catastrophic failure or emergency shutdown of the lake diversion tunnel caused by closure of the intake emergency shutoff valve, a reduction of the prescribed flow rate through the river release valve would immediately trigger the dam outlet gate to open to provide immediate flow continuity in the Eklutna River. If this event were to occur during the portion of the year that Eklutna Lake is at or above El. 864.59 ft, the outlet gate has the capability to continuously release the required flow rate. If this event were to occur when the lake is disconnected from the dam, it is anticipated that flow continuity into the Eklutna River would last for approximately 12 hours as the pond drains, during which an emergency fish salvage/rescue plan would be initiated.

5.0 Hydraulic Design

5.1 General Description

This section presents the hydraulic design of the Eklutna River Release Facility and summarizes the hydraulic and transient analyses performed to date.

5.2 Hydraulic Analysis

A spreadsheet hydraulic model was developed to determine the hydraulic losses and hydraulic profile for the conveyance from the intake to the EWTF. The following sections describe how the minor and major friction losses were calculated and what coefficients were used in the analysis.

5.2.1 Major Friction Losses

An accurate estimate of the energy losses caused by the shear stress between the fluid and the boundary is essential to determining the hydraulic changes caused by additional flow releases being made from the river release structure. The shear stress or friction factor is a function of the viscosity and velocity gradient of the fluid near the boundary (Tullis, 1989). The Darcy-Weisbach equation (Equation 1) was used to determine the friction losses in the tunnel and pipeline. The Colebrook-White equation (Equation 2) was used to determine the friction factor, used in the Darcy-Weisbach equation, for the conveyance. The selected roughness (e) for different linings used in the analysis is presented in Table 5-1.

$$h_f = \frac{fL}{D}\frac{V^2}{2g} \qquad \text{Equation 1}$$

$$\frac{1}{\sqrt{f}} = 1.14 - 2\log\left(\frac{e}{D} + \frac{9.35}{R_e\sqrt{f}}\right) \qquad \text{Equation 2}$$

Where:

h_f = friction losses (ft)
f = friction factor
D = Pipe or Tunnel Diameter (ft)
L = Pipe or Tunnel Length (ft)
V = Average Velocity (ft/second)
g = Gravitational Acceleration (ft/second²)
e = roughness height (ft)
R_e = Reynolds Number, using Kinematic Viscosity at 60°F = 1.22E-05 ft²/s

Table 5-1. Pipeline and Tunnel Roughness Values.

Description	Value (mm)	Value (ft)	Range (mm)	Reference
Concrete-Lined Tunnel Roughness Height, *e* (feet) [1/]	0.30	0.0098	0.30-3.0	Rennels, 2012
Cement-Mortar Lined Steel Pipe, *e* (feet) [2/]	0.10	0.00035	0.10 – 0.12	AWWA, 2017

[1/] CIP Concrete Lining in power tunnel and lake diversion tunnel.

[2/] Cement-mortar lined steel pipe in AWWU pipeline segment P-4 and new river release structure.

5.2.2 Minor Friction Losses

Minor losses, or more appropriately called local losses, is a term referring to losses that occur at conveyance system appurtenances such as entrances, elbows, orifices, valves, etc. The head losses, as a result of a minor loss, are due primarily to the formation and decay of turbulent eddies (Tullis, 1989). The minor head loss is proportional to the velocity head, as presented in Equation 3. The minor loss coefficients used in the analysis are presented in Table 5-2.

$$h_l = K_l \frac{V^2}{2g} \qquad \text{Equation 3}$$

Where:

h_l = Minor losses (ft)
K_l = Loss Coefficient
V = Average Pipe Velocity (ft/second)
g = Gravitational Acceleration (ft/second²)

Table 5-2. Minor Loss Coefficients.

Description	Assumed Value	Reference
Entrance Loss, Sharp Corner	0.50	Tullis, 1989
Full Open Isolation Valve	0.20	Tullis, 1989
90 Bend Loss	0.24	Tullis, 1989
Profile Bar, Trashrack	0.52	Tullis, 1989
Exit Loss	1.0	Tullis, 1989

5.2.3 Combined Head Losses

Considering both major and minor friction losses in the proposed hydraulic conveyance, an overall system head loss function was developed from the intake structure to the EWTF. The

combined head losses consider flow withdrawn at the EWTF and the maximum flow rate of 660 cfs entering the intake structure withdrawn at the power plant. The head loss equation as a function of flow rate is provided below in Equation 4. The site-specific head loss coefficient is equal to 0.008, and the residual losses caused by the maximum flow withdrawn through the power plant is 3.6 ft. The corresponding head loss curve is provided in Figure 5-1.

$$H_T = KQ^2 + B \qquad \text{Equation 4}$$

Where:

H_T = Combined Head Losses (ft)
K = Head Loss Coefficient
Q = Flow Rate (cfs)
B = Residual Loss Coefficient (ft)

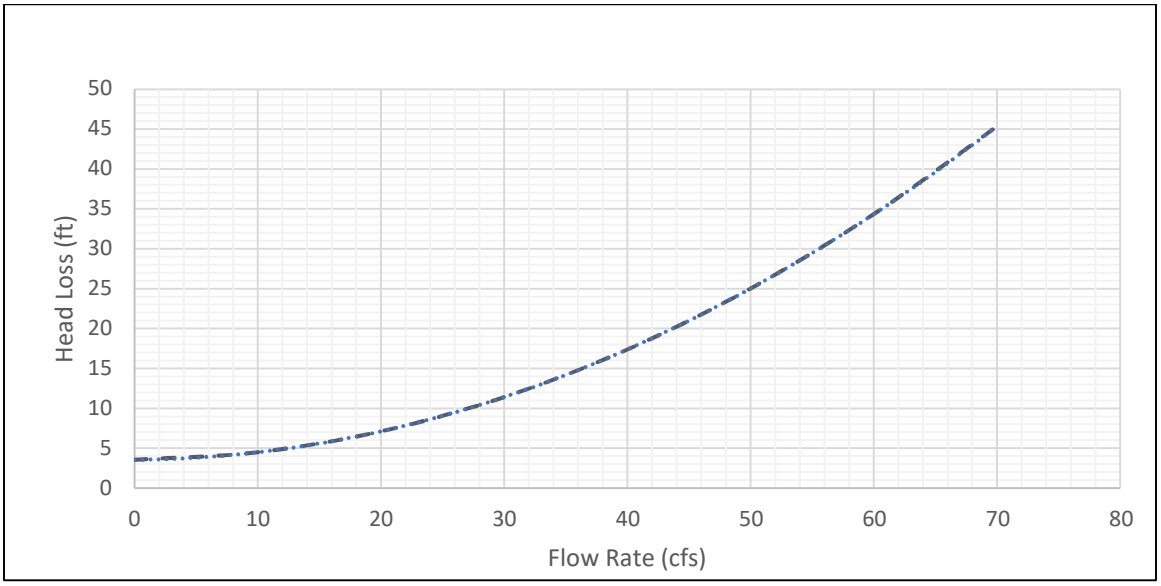

Figure 5-1: Head Loss Curve - Hydraulic Conveyance.

5.2.4 Hydraulic Grade Line – Existing Conditions

The AWWU conveyance was analyzed under various flow distribution scenarios to determine baseline operating conditions. The hydraulic grade line of the system at the average lake water surface elevation and a maximum withdrawal of 63 cfs (41 MGD) is presented in Figure 5-2. A tabular summary of the losses through the system and residual pressures at the EWTF under the average monthly operating conditions is presented in Table 5-3.

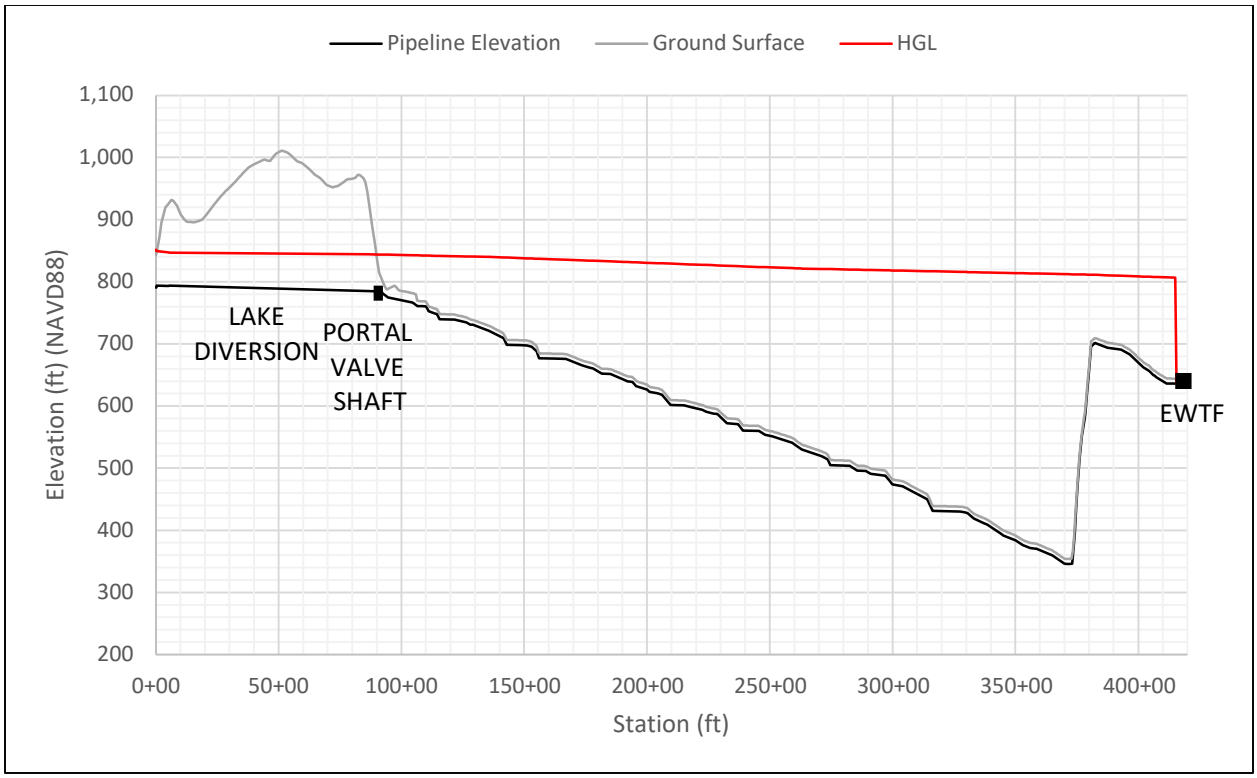

Figure 5-2. Hydraulic Grade Line – 63 cfs; AWWU Conveyance.

Table 5-3. EWTF Pressure – Existing Conditions; Monthly Average Flow.

5.2.5 Hydraulic Grade Line – Future Conditions

A hydraulic analysis was performed on the AWWU hydraulic conveyance under a proposed future flow regime. Under this future operating scenario, the maximum flow rate of 63 cfs (41 MGD) was delivered to the EWTF at the average monthly water surface elevations of Eklutna Lake. To determine impacts to the EWTF as a result of operation of the proposed Eklutna River Release Facility, a secondary scenario was analyzed which added a secondary withdrawal immediately upstream of the AWWU Portal Valve Shaft, corresponding to the monthly instream flow regime as discussed in Section 4.2. The residual pressure at the EWTF under a future flow regime with and without the instream flow releases is presented in Table 5-4 and Table 5-5, respectively.

Table 5-4. EWTF Pressure – Maximum EWTF Withdrawal; Monthly Average Flow.

5.3 Transient Analysis

A transient analysis was completed to determine the expected pressure fluctuations within the existing Project power tunnel, AWWU lake diversion tunnel, AWWU pipeline, and EWTF caused by operations of the proposed ERRV. The following subsections describe the results of that analysis.

5.3.1 Model Configuration

The hydraulic transient pressures were calculated using Applied Flow Technology (AFT) Impulse Version 9 modeling software. AFT Impulse simulates the hydraulic pressure surges using the Method of Characteristics, the most widely used method for solving fluid transient problems. This section presents an overview of the model setup, assumptions, and input parameters which represent operating conditions and associated hydraulic transients.

5.3.2 Piping Arrangements

The hydraulic transient model was constructed to represent the physical geometry of the conveyance network from Eklutna Lake including the length of associated tunnels and piping, vertical profile, and varying pipeline wall thicknesses throughout the alignment. The model includes the intake structure, power tunnel, AWWU lake diversion tunnel, AWWU pipeline to

the EWTF, and the proposed ERRV and associated bypass piping. Figure 5-3 presents the model used to evaluate the transients that occur during closure of the ERRV.

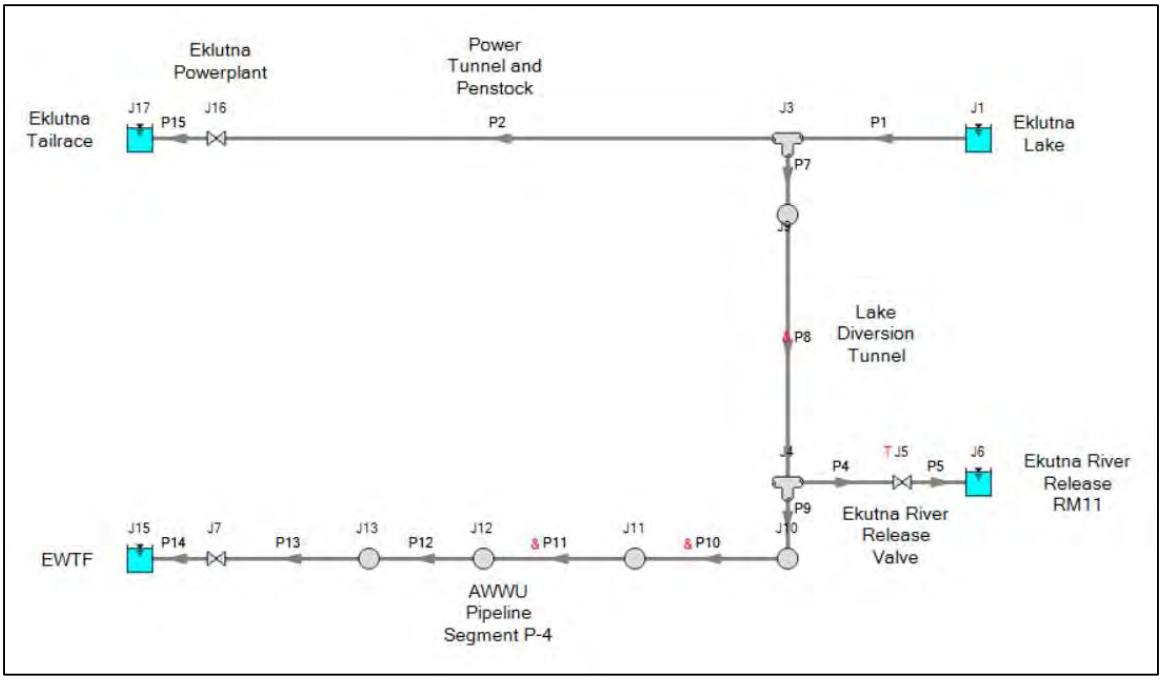

Figure 5-3. Transient Model Layout.

5.3.3 Input Parameters

The conveyance segment lengths, required to solve the Method of Characteristics, were increased until the time step was <0.005 seconds. The discrete gas cavity model was used to simulate the model transient cavitation using a psi weight factor of 0.95, and initial void fraction of 1E-07, with a void fraction reference pressure of 1 atmosphere. The simulations were run for 500 seconds to observe the dampening of the transient wave. Four model runs were used as the basis of the analysis as detailed in Table 5-6.

Table 5-6. Transient Model Runs.

Model Run		Water Surface Elevation (NAVD88)	Eklutna Power Plant Flow Rate (cfs)	EWTF Flow Rate (cfs)	ERRV Flow Rate (cfs)
A	No Flow	888.39	0	0	80
B		817.59	0	0	40
C	Max Flow	888.39	660	63	80
D		817.59	660	63	40

5.3.3.1 Wave Celerity

The wave celerity is the speed at which a transient wave propagates through the conveyance and is a function of the acoustical velocity of the fluid and the physical properties of the pipelines and tunnel. Table 5-7 presents the wave celerity parameter utilized for each penstock segment.

Table 5-7. Hydraulic Conveyance Wave Celerity.

Description	Units	Lake Diversion Tunnel	AWWU Pipeline Segment P-4	River Release Bypass
Modulus of Elasticity Lining/Wall	psi	4,000,000	30,000,000	30,000,000
Poisson Ratio		0.2	0.3	0.3
Soil/Rock Modulus of Rigidity	kPa	30,000	7,000	7,000
Wave Celerity	ft/s	3,940	3,000	3,220

5.3.3.2 Eklutna Powerplant

The Eklutna Powerplant contains two vertical-shaft Francis-style hydroelectric generating units with an installed nameplate capacity of 44.4 MW. The maximum flow available for diversion through the powerplant is 660 cfs. The fixed flow rate through the powerplant defined for each model run is presented in Table 5-8.

Table 5-8. Eklutna Power Plant Model Parameters.

Model Run		Flow Rate (cfs)	Water Surface Elevation (NAVD88)	Cv (gpm/psi$^{0.5}$)
A	No Flow	0	888.39	0
B		0	817.59	0
C	Max Flow	660	888.39	16,240
D		660	817.59	17,070

5.3.3.3 Eklutna Water Treatment Facility

The EWTF contains one horizontal-shaft Turgo-style hydroelectric generating units with an installed nameplate capacity of 922 HP (690 kW). The maximum flow available to the EWTF is 63.4 cfs (41 MGD). For the purposes of this transient model, the facility was modeled as a

valve with a fixed flow coefficient. The fixed flow rate through the powerplant defined for each model run is presented in Table 5-9.

Table 5-9. EWTF Model Parameters.

Model Run		Flow Rate (cfs)	Water Surface Elevation (NAVD88)	C_v (gpm/psi$^{0.5}$)
A	No Flow	0	888.39	0
B		0	817.59	0
C	Max Flow	63.4	888.39	2,984
D		63.4	817.59	3,576

5.3.3.4 Eklutna River Release Facility

The Eklutna River Release Facility consists of a 42-inch tee off of the main 54-inch AWWU Pipeline segment upstream of the portal valve structure followed by a run of approximately 30 feet of piping and an energy dissipating valve for release into the Eklutna River. The proposed valve to control the flow into the Eklutna River is a 30-inch class 150 Bailey model B-10 sleeve valve, as presented in Figure 5-4.

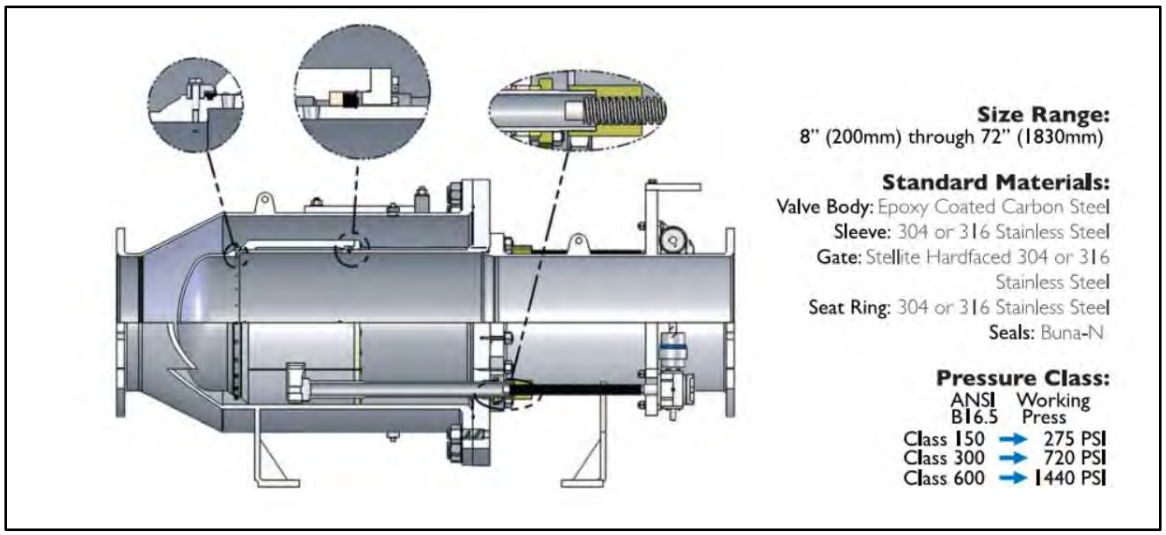

Figure 5-4. Bailey Model B-10 Sleeve Valve (Bailey, 2023).

Discharge through the sleeve valve is a function of the actuator stroke and the differential pressure across the valve. The maximum flow through the valve at the minimum water surface elevation of the reservoir is 40 cfs. The maximum flow through the valve at the maximum water surface elevation corresponds to the channel maintenance flow regime of 80 cfs. The

sleeve valve discharge coefficient (C_v) as a function of the valve stroke is presented in Figure 5-5.

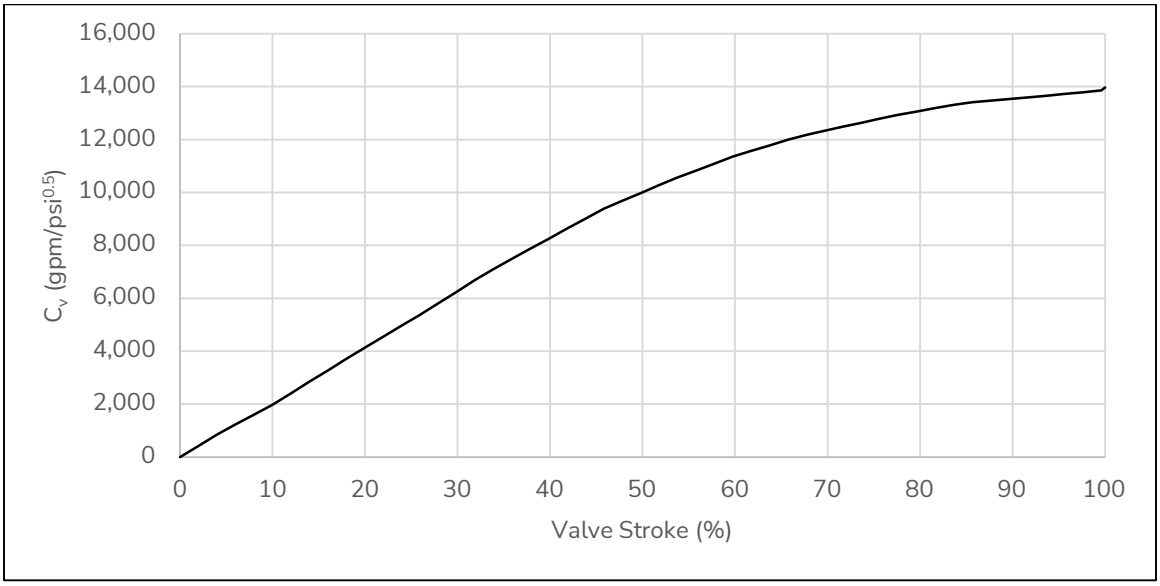

Figure 5-5. Sleeve Valve Discharge Coefficient, C_v.

The closure rate of the sleeve valve in the event of an emergency shall be set to meet or be less than the closure rate of the AWWU intake emergency shutoff valve to prevent the ERRV from continuing to release water and dewatering the AWWU pipeline in the event of an emergency shutdown of the system. The closure rate of the intake emergency shutoff valve is not known at this time, however per the design criteria of the system the closure rate was initially set for 10-minutes for a full closure cycle and may be adjusted but shall not be set for < 5 minutes to limit potential surge pressures (AWWU 1989). For conservative purposes, the full stroke of the sleeve valve is set to a closure time of 5 minutes. During commissioning of the valve, the closure rate shall be set to match the AWWU intake emergency shutoff valve closure timing. The input parameters for the sleeve valve for each model run is presented in Table 5-9.

Table 5-10. Eklutna River Release Facility Model Parameters.

Model Run		Flow Rate (cfs)	Water Surface Elevation (NAVD88)	Initial C_v (gpm/psi$^{0.5}$)	Initial Stroke (%)	Closure Time (sec)
A	No Flow	80	888.39	6,090	29%	78
B		40	817.59	7,445	36%	105
C	Max Flow	80	888.39	6,670	32%	95
D		40	817.59	13,700	100%	300

5.3.4 Transient Analysis Results

To evaluate that the closure rate of the proposed sleeve valve is adequate to prevent the lake diversion tunnel and associated facilities from experiencing pressure surges outside of their design limitations, the maximum and minimum transient pressure were evaluated at the extreme upper and lower water surface elevations in Eklutna Lake. The criteria utilized for evaluation of the pressure surges is discussed in Section 3.6. The results of the transient analysis for model runs A and B with no flow being delivered to the Eklutna Power Plant or the EWTF is presented in Figure 5-6 and summarized in Table 5-11.

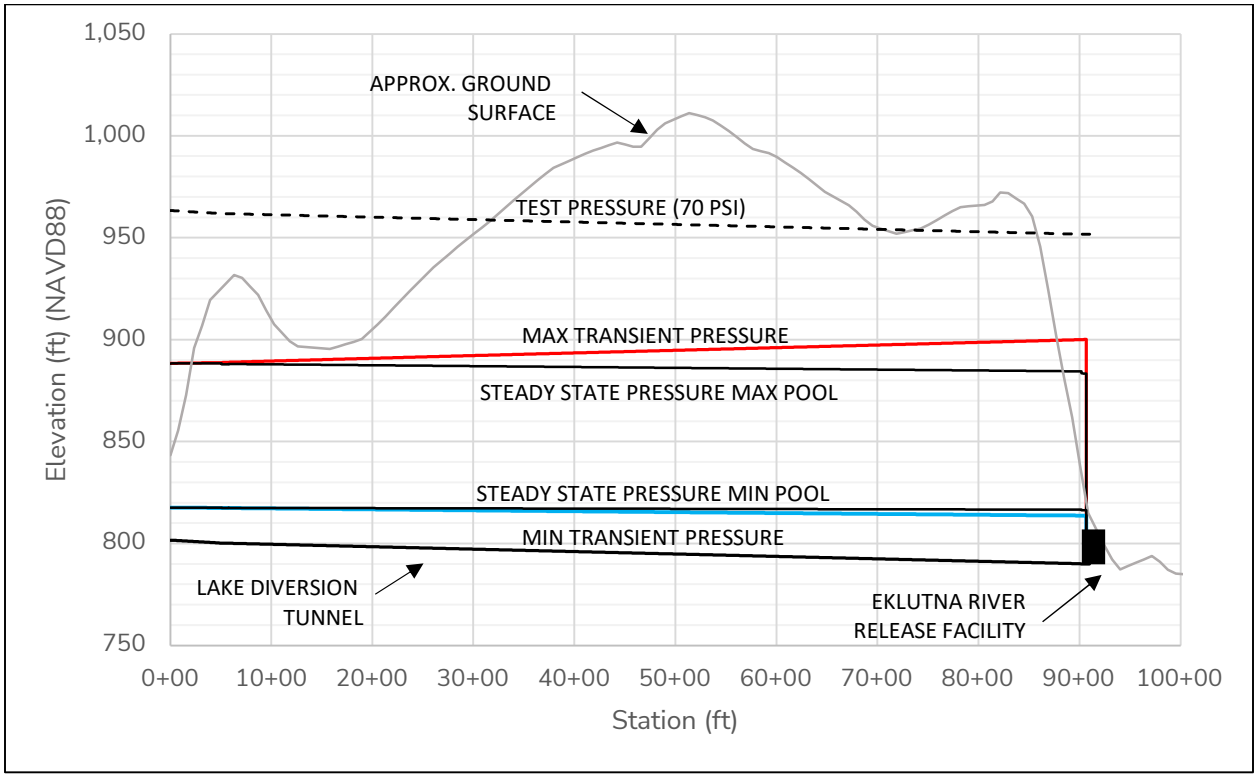

Figure 5-6. Transient Pressure Results; No Flow to Power Plant or EWTF.

Table 5-11. Summary of Transient Pressure; Lake Diversion Tunnel - Model Run A/B.

Description	Water Surface Elevation (NAVD88)	Closure Time (sec)	Steady State Pressure (psi)	Transient Pressure (psi)[1]	Test Pressure (psi)
Maximum Pool	888.39	78	56	62	70
Minimum Pool	817.59	105	26	20	

[1] Transient pressure displayed presents the maximum upsurge pressure at maximum WSEL and minimum downsurge pressure at minimum WSEL.

To determine how the pressure surge is impacted by operations of the EWTF and powerplant, model runs C and D incorporated the maximum flow rate drawn through both facilities. The results of the transient analysis for model runs C and D with the maximum flow being delivered to the Eklutna Power Plant and the EWTF is presented in Figure 5-7 and summarized in Table 5-11. Under each flow condition modeled, the maximum transient pressure is within the design pressure for the Lake Diversion Tunnel and the minimum downsurge does not cause partial vacuum or interruption of flow within the conveyance.

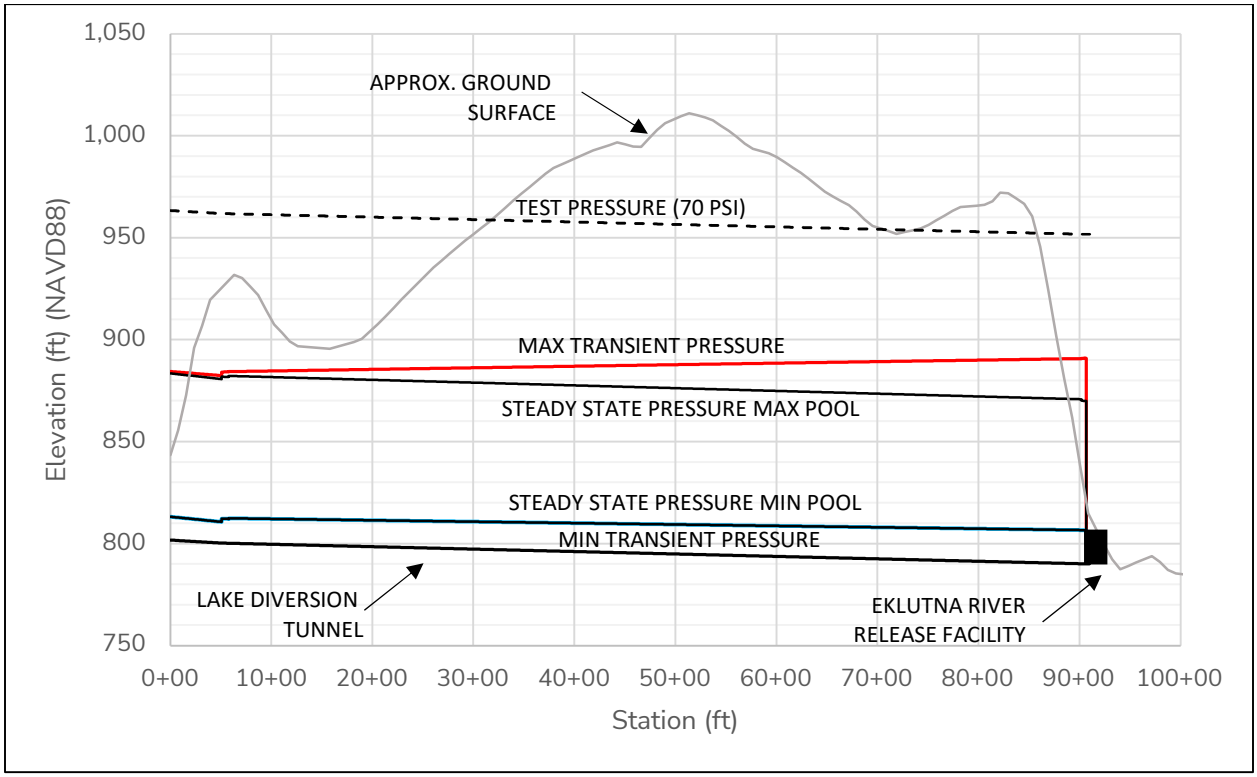

Figure 5-7. Transient Pressure Results; Max Flow to Power Plant and EWTF.

Table 5-12. Summary of Transient Pressure; Lake Diversion Tunnel - Model Run C/D.

Description	Water Surface Elevation (NAVD88)	Closure Time (sec)	Steady State Pressure (psi)	Transient Pressure (psi)[1]	Test Pressure (psi)
Maximum Pool	888.39	95	50	58	70
Minimum Pool	817.59	300	22	19	

[1] Transient pressure displayed presents the maximum upsurge pressure at maximum WSEL and minimum downsurge pressure at minimum WSEL.

6.0 Civil Design Criteria

6.1 General Description

This section presents the civil design elements at the Eklutna River Release Facility and summarizes civil design criteria, erosion and sediment control requirements during and post-construction, stormwater design, and the required grading at the site.

6.2 Design Criteria

The Project is located in the Municipality of Anchorage in Alaska; therefore, during and after construction, the Project will be required to comply with all federal, state, and county laws regarding environmental pollution control.

6.2.1 Erosion Control and Grading

A portion of the existing site will be cleared and graded to support the expansion of the AWWU Portal Valve fencing and construction of the Eklutna River Release Facility. Prior to construction, an erosion and sediment control plan will be developed. During construction, all construction activities shall follow Best Management Practices (BMP) plan to prevent erosion, reduce sediment discharges from construction sites, and prevent damage by sedimentation, erosion, or dust to streams, waterways, natural areas, and adjacent properties.

Areas disturbed during construction will be carefully graded and replanted with native vegetation leaving the area similar to the condition it was prior to the disturbance activities.

6.2.2 Site Fencing

As part of the development of the site to provide room for the new isolation gate and river release structures, the security fencing around the perimeter of both the existing portal facility and the new ERRF facility will be expanded. The fence will be set back a minimum of 25-ft from the buildings to allow for a drive aisle around the facility and room for parking and miscellaneous storage. Additionally, two new double-leaf gates will be installed in the fencing to allow ease of snow removal. The new gates will be located on the northwest and southwest corners of the facility allowing a small plow to push accumulated snow away from the buildings periodically during winter.

7.0 Structural Design Criteria

The structural design criteria apply to all design procedures to be implemented during the Project design. Structural design considerations listed in this section include detailing of structural components, material selection, and design requirements that are intended to be incorporated into the Project.

7.1 Applicable Codes and Standards

The structural design will conform to the following reports, criteria, and industry codes and standards. The applicable version of each document is the latest edition in force unless noted otherwise. References to the specific codes and standards will be included in the applicable technical specifications as the final design documents are prepared.

Table 7-1. Structural Codes and Standards.

Number	Description
Building Code	
ASCE 7	ASCE 7/SEI 7-16 Minimum Design Loads for Buildings and Other Structures, 2016
Design Standards and References	
ACI 318	Building Code Requirements for Structural Concrete, 2014
ACI 350	Code Requirements for Environmental Engineering Concrete Structures, 2006
ACI 360R	Design of Slabs on Ground, 2006

EM 2104	USACE EM 1110-2-2104 – Strength Design for Reinforced Concrete Hydraulic Structures, 2016

7.2 Materials

Materials and standards for concrete, concrete-related materials, structural steel, and miscellaneous metals for the Project are indicated in Table 7-2.

Table 7-2. Structural Materials and Design Standards.

Component	Material and Standard
Concrete and Related	
Existing Concrete	Compressive Strength (static), f'ce = 3000 psi
New Concrete	Minimum 28-day Compressive Strength, f'c = 4,500 psi
Reinforcing Steel	ASTM A615, Grade 60
Adhesive Anchors	Two component epoxy, ASTM C-881 (with SS threaded anchor rod or reinforcing dowels)
Structural Steel	
Wide Flange Shapes	ASTM A992, Grade 50ksi
M, C, L shapes	ASTM A572, Grade 50ksi
Tube (HSS)	ASTM A500, Grade C. (46ksi Round / 50ksi Rect.)
Plates and Bars	ASTM A572, Grade 50ksi
High-Strength Bolts	ASTM F3125, Grade A325
Anchor Rods	ASTM F1554, Grade 50ksi (threaded) A193, Type 316 Stainless Steel
Miscellaneous Metals	
Guardrail and Grating	Galvanized steel

7.3 Design Loads

The general load types considered in the design of the structure are summarized in Table 7-3.

Table 7-3. Structural Design Loads.

Load Type	Description
Dead	Self-weight of all permanent structural elements as well as super-imposed weight of permanent mechanical and electrical equipment and piping.
Live	Temporary loads produced by the use and occupancy of the building or structure (excluding environmental loads). This load type includes those produced by movable objects and loads on guardrails, fixed ladders, and handrail systems by maintenance personnel.
Hydraulic	Hydrostatic and hydrodynamic loads imposed on surfaces containing, retaining, or displacing water.

Soil	Weight of moist or buoyant soil on the structure and lateral earth pressures against surfaces retaining soil.
Wind	By inspection, wind loading does not govern the structural design aspects of these project features.
Seismic	Inertial forces produced by ground motion during a seismic event. The effects of this load type on these structures and non-structural equipment will be approximated based on the provisions of ASCE7.
Thermal	Self-straining loads due to thermal variation. Maximum and minimum temperatures for the site location will be considered.

7.3.1 Design Basis for Reinforced Concrete Structures

Per EM 1110-2-2104, all reinforced concrete structures will satisfy Load Factor and Resistance Design (LRFD) methodology by providing the required strength defined by the equation below:

$$U = \sum \gamma_i L_{ni} \leq \phi R_n$$

Where:

- $U =$ required strength
- $\gamma_i =$ USACE load factors per EM 2104
- $L_{ni} =$ load effects per structural calculations
- $\emptyset =$ resistance factor from ACI
- $R_n =$ nominal resistance from ACI

This methodology will be applied to the design of other material types in accordance with the relevant design standards and references. Refer to the structural calculations for additional information and derivation of these equation variables for specific Project features and components.

8.0 Mechanical Design Criteria

The mechanical design criteria apply to all design procedures to be implemented during the Project design. Mechanical design considerations listed in this section include detailing of mechanical components, material selection, and design requirements that are intended to be incorporated into the Project.

8.1 Applicable Codes and Standards

The mechanical design will conform to the following reports, criteria, and industry codes and standards. The applicable version of each document is the latest edition in force unless noted otherwise. References to the specific codes and standards will be included in the applicable technical specifications as the final design documents are prepared.

8.2 Isolation Gate Structure

The isolation gate structure is located immediately upstream of the AWWU portal valve shaft and houses two isolation knife gate valves, fill piping, combo air release/vacuum breaker valve, a flow meter, sump pump, backup 24VDC emergency batteries, and electrical control cabinets. A representation of the isolation gate structure valve floor is presented in Figure 8-1.

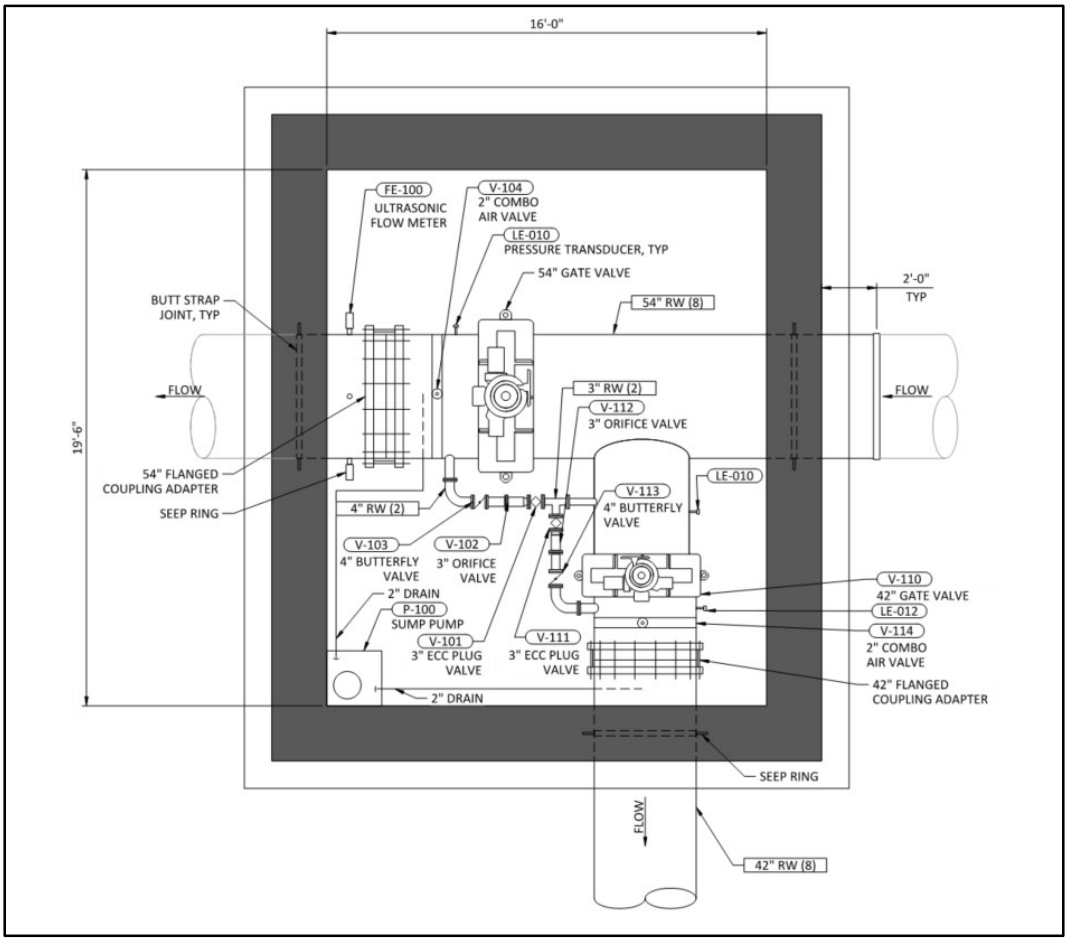

Figure 8-1. Isolation Gate Structure Plan View.

8.2.1 Isolation Gate Valves

Two new isolation gate valves will be installed within the proposed isolation gate structure immediately upstream of the AWWU portal valve shaft. The valves are anticipated to be a 54-inch and 42-inch class 150 bonneted knife gate valve for the AWWU pipeline and river release bypass pipelines, respectively. Each valve will be actuated with an electric motor operator with a rated load of approximately ¾ HP and an electrical service of 240V single phase. The valve will be designed for a maximum operating pressure of 75 psi (175 ft) corresponding to the peak transient pressure caused by closure of the AWWU portal

emergency shutoff valve. All wetted parts are anticipated to be fabricated with type 304 stainless steel for corrosion resistance with a carbon steel bonnet, flanges, and stiffeners for enhanced strength.

8.2.2 Bypass Filling and Drainage Piping

The isolation gate valves are designed to open and close under balanced head conditions. In the event the valve is used for isolation, the piping downstream of the valve would be drained through a 2-inch drain line with ball valve located downstream of each gate valve. All water would be drained into the sump located in the floor of the structure to be discharged to the Eklutna River. To re-open the valve, the line must be recharged through a new 4-inch filling line with energy dissipating sleeve-type orifice plate and 3-inch eccentric plug valve for flow control.

8.3 Eklutna River Release Structure

The Eklutna River release structure houses the energy dissipating flow control valve for making releases into the Eklutna River as well as an ultrasonic type flow meter for monitoring the flow rate. A representation of the Eklutna River release structure valve floor is presented in Figure 8-2.

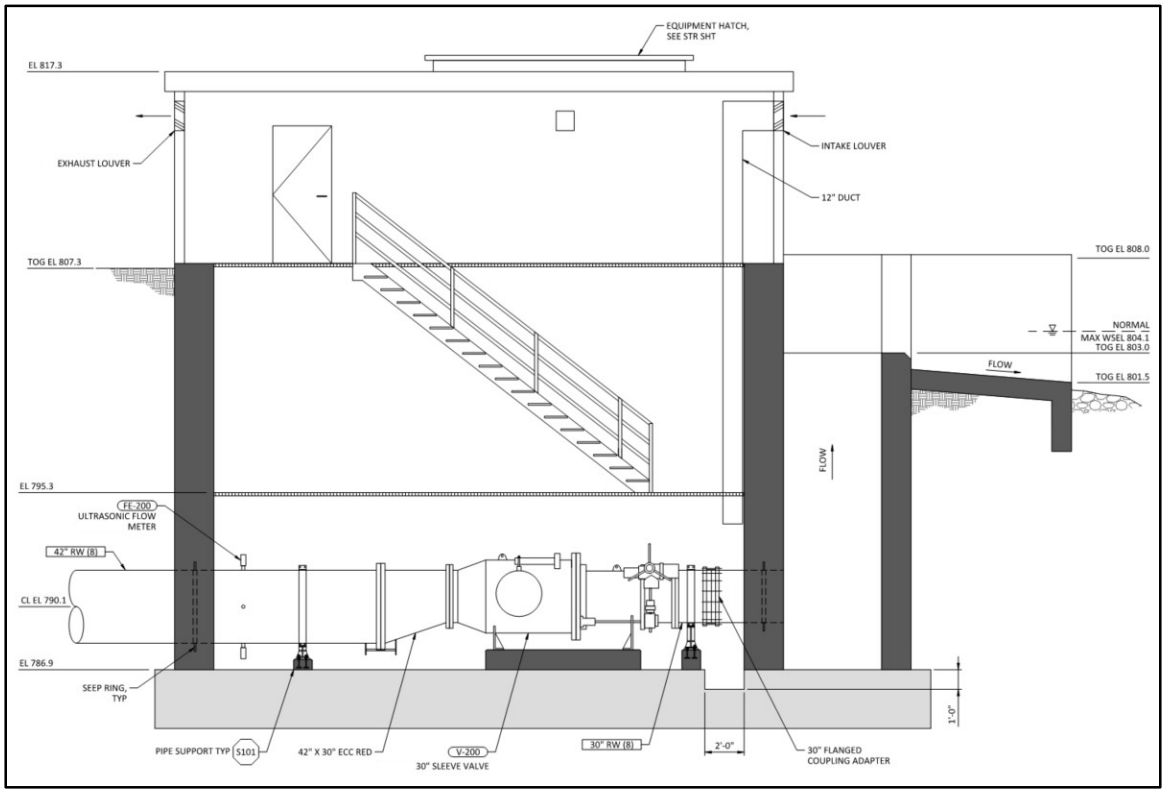

Figure 8-2. Eklutna River Release Structure Floor Plan.

8.3.1 Sleeve Valve

At the Eklutna River release structure, a sleeve valve is anticipated to be used for flow control and energy dissipation purposes. A sleeve valve for this application has improved energy dissipating characteristics than other modulating control valves, allowing operation over a wide range of head while reducing vibration and noise. Cavitation is controlled by directing implosions within the center of the valve chamber away from metallic surfaces, increasing the operating life and reducing O&M costs. The valve is sized based on the maximum flow coefficient necessary for operation, which requires it to pass the maximum instream flow at the minimum water surface elevation of Eklutna Lake, or the maximum channel maintenance flow rate at the lowest water surface elevation needed for operation of the dam outlet gate. Valve sizing calculations are presented in Table 8-1.

Table 8-1. Sleeve Valve Sizing Criteria.

Description	Maximum Instream Flow	Maximum Channel Maintenance Flow
Flow Rate (cfs)	40	80
Flow Rate (gpm)	17,952	35,904
Minimum WSEL; Eklutna Lake (ft) (NAVD88)	817.6	864.6
Discharge Weir Crest Elevation (ft) (NAVD88)	803.0	803.0
Head on Weir Crest (ft)	1.1	1.8
Diversion Tunnel Pressure Losses; Max Flow (ft)	9	17
Differential Pressure, dP (psi)	2.2	19.3
C_v; (gpm/$dP^{0.5}$)	13,700	8,340

The proposed valve for this application is the Bailey Model B-10 sleeve valve with an inline configuration. Bailey sleeve valves are a common valve selected for energy dissipation purposes within the water supply industry. The maximum Cv determine from Table 8-1 was compared to the valve sizing selection from bailey valves, which results in the selection of a 30-inch sleeve valve as presented in Figure 8-3.

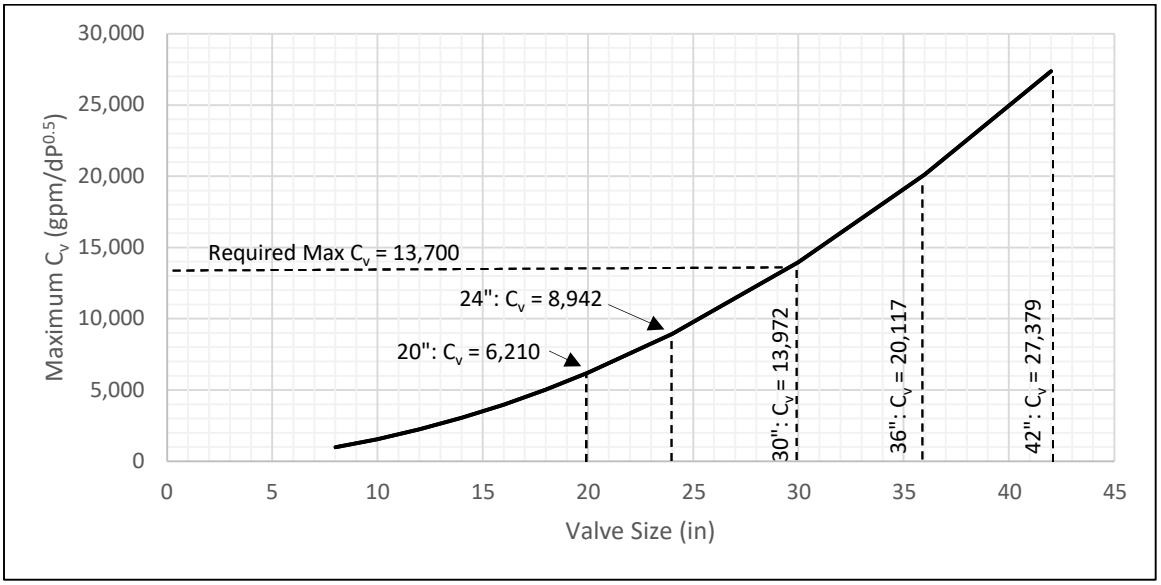

Figure 8-3. Bailey Model B-10 Valve Sizing.

9.0 Electrical Design

The electrical design criteria apply to all design procedures implemented during the Project design. Electrical design considerations listed in this section include detailing of electrical components, material selection, and design requirements that are intended to be incorporated into the Project.

9.1 Applicable Codes and Standards

Applicable codes and standards are listed in Table 9-1.

Table 9-1. Electrical Codes and Standards

Code	Standard
NFPA 70	National Electrical Code
NFPA 70E	National Electrical Safety Code (NESC)
NFPA 110	Standard for Emergency and Standby Power Systems
IEEE	Institute of Electrical and Electronics Engineers
NEMA	National Electrical Manufacturers Association

NFPA – National Fire Protection Association

9.2 Materials

Materials are summarized in Table 9-2.

Table 9-2. Electrical Materials

Material	Standard
Circuit Breakers	NEMA AB 1, UL 489
Switches	NEMA KS 1, UL 98
Terminal Blocks	UL 1059
Power Conductors/Cable	NEMA WC 70, UL 44, UL 83, UL 854
Instrumentation Cable	NEMA WC 57, UL 13, UL 44
Boxes and Enclosures	NEMA 250

Material	Standard
Raceway	NEMA C80.1, NEMA C80.6, NEMA RN 1, UL 6, UL 360, UL 514B, UL 651, UL 1242
Standby Generators	NEMA MG 1, UL 142, UL 508, UL 1236, UL 2200
Transfer Switches	NEMA ICS 2, UL 1008
Grounding and Bonding Equipment	UL 467

NEMA – National Electrical Manufacturers Association

9.3 Power Distribution

The isolation gate actuators and sleeve valve actuator will be served from a 240V panelboard. A surge protective device will be provided at 240V and 120V to protect the system from transient surges. All 240/120V loads will be served from a power center load center. This will include the building lights, convenience receptacles, instrumentation, SCADA system, and telemetry, with 24 Vdc provided where necessary by a 120V-fed power supply.

A UPS will provide battery backup to all SCADA system equipment and instrumentation for short-term power losses (< 5 minutes). Standby power for this site is dependent on a portable standby generator that would provide power to this site during an outage.

Equipment ratings are sized to NEC requirements and industry standards. The electrical distribution at the Eklutna River Release Facility will consist of the following:

- 240/120V, 5 kVA, single-phase, 3-wire mini power center with 18-pole load center
- Local disconnects for devices as required
- AWWU Pipeline isolation gate electric actuator
- Eklutna River release isolation gate electric actuator
- Eklutna River release sleeve valve electric actuator

9.4 Process Instrumentation and Control

A SCADA system will be implemented to supervise and control the ERRV and to monitor flow through the AWWU pipeline and river release bypass. The SCADA system will consist of a metal backplane in an LCP with components mounted to it. This includes PLC and I/O modules, UPS, control power supply and distribution block, control relays, terminal blocks, overcurrent protection, digital communication hardware, and other required appurtenances. It is presumed that datalogging will be performed on the overall AWWU and Eklutna Power Plant SCADA

system. If autonomous and more continuous datalogging is determined to be required, a datalogging-capable HMI will be specified in addition to the above components.

The SCADA system will feed and communicate with a transit-time ultrasonic flowmeter located within the Eklutna River release structure to monitor river release flow and to communicate with the AWWU intake valve shaft and portal valve shaft. The instrument controller for the transit-time flowmeter will be housed in the Eklutna River release structure.

A fiber optic communication network will be implemented between all systems of the Project via a fiber optic infrastructure. The Eklutna River Release Facility will connect to a fiber optic communication network between the EWTF, Eklutna Power Plant, AWWU Intake Valve Shaft and AWWU Portal Valve Shaft. Digital communication protocol will be Ethernet/IP over single-mode fiber optic cable (OS2). All new segments of installation will consist of fiber optic cable that will be all-dielectric, loose-tube buffered, with water-repellant gel-fill and jacket rated for direct-bury. For adequate spares to mitigate strand failure, 24-strand cable is proposed. The cable will be installed in HDPE SDR-11 smoothwall conduit. The fiber optic line will be brought to the LCP housed fiber connector housing for termination, then patched to the managed Ethernet switch in a loop configuration. All strands of all fiber optic cables shall be terminated and certified to the OTDR and OLTS tests. The Ethernet switch will connect the PLC to the communication system.

The PLC will be networked in continuous communication with the AWWU and Eklutna Power Plant SCADA system for real-time supervision and system operational adjustments. The PLC will be capable of autonomous operation and will be programmed to establish a fail-safe condition of the Eklutna River Release Facility in the event of loss of communications with Eklutna Power Plant SCADA.

Field instrumentation consists of the following, as provided in Table 9-3.

Table 9-3. Field Instrumentation

Instrument Tag ISA)	Instrument Type	Parameters	Control Loop
LE-010	Pressure Transducer	Conduit Pressure Tap, 0-75 psi range	Measure Pressure in AWWU Pipeline U/S of Isolation Gate Valve
LE-011	Pressure Transducer	Conduit Pressure Tap, 0-75 psi range	Measure Pressure in AWWU Pipeline D/S of Isolation Gate Valve
LE-012	Pressure Transducer	Conduit Pressure Tap, 0-75 psi range	Measure Pressure in River bypass D/S of Isolation Gate Valve
FE-100	Flowmeter, Transit-Time Ultrasonic, 4-path	54-inch pipe, 0 - 63 cfs	Measure flow to AWWU Pipeline
FE-110	Flowmeter, Transit-Time Ultrasonic, 4-path	42-inch pipe, 0 - 80 cfs	Measure flow to Eklutna River

In addition to the field instrumentation, the remainder of I/O signals necessary will be dedicated to the status and control signals for the isolation gate actuators, sleeve valve actuator, and site security signals. Signals for all actuators include discrete RUN OPEN and RUN CLOSE commands, discrete FAULT status supervision, and discrete full OPENED and full CLOSED status monitoring.

GENERAL NOTES:

1. THESE ABBREVIATIONS APPLY TO THE ENTIRE SET OF CONTRACT DRAWINGS.
2. LISTING OF ABBREVIATIONS DOES NOT IMPLY ALL ABBREVIATIONS ARE USED IN THE CONTRACT DRAWINGS.
3. ABBREVIATIONS SHOWN ON THIS SHEET INCLUDE VARIATIONS OF THE WORD. FOR EXAMPLE, "MOD" MAY MEAN MODIFY OR MODIFICATION; "INC" MAY MEAN INCLUDED OR INCLUDING; "REINF" MAY MEAN EITHER REINFORCE OR REINFORCING.
4. SCREENING OR SHADING OF WORK IS USED TO INDICATE EXISTING COMPONENTS OR TO DE-EMPHASIZE PROPOSED IMPROVEMENTS TO HIGHLIGHT SELECTED TRADE WORK. REFER TO CONTEXT OF EACH SHEET FOR USAGE.

- EXISTING BURIED TELEPHONE LINE EVIDENCED BY PEDESTALS & WARNING PADDLES
- EXISTING FENCE LINE
- PROJECT BOUNDARY
- TREE PROTECTION FENCE
- LIMITS OF DISTURBANCE
- SHORING

SITE PLAN SYMBOLS

- ARROW INDICATES DIRECTION OF PLAN NORTH
- CONIFER TREE: FIR, SPRUCE, LARCH OR PINE, 8" DIAMETER OR LARGER.
- DECIDUOUS TREE: COTTONWOOD, HAWTHORN, ASPEN, 8" DIAMETER OR LARGER.
- MH — MANHOLE
- EB — ELECTRIC BOX
- STORM DRAIN MANHOLE
- FH — FIRE HYDRANT
- YH-X — YARD HYDRANT
- SURVEY CONTROL POINT, AS NOTED.
- POLE ANCHOR
- POWER POLE
- LIGHT POLE
- SIGN
- SURVEY HUB
- SECTION CORNER
- BENCH MARK
- EXISTING HEADWALL
- EXISTING MONITORING STATION
- EXISTING FENCE
- STATE PLANE COORDINATE MARKER
- EXISTING TREE LINE
- EXISTING BUILDING, STRUCTURES
- EXISTING SECTION CORNER MONUMENT FOUND AS DESCRIBED
- EXISTING 5/8" REBAR CONTROL POINT MONUMENT, BORING LOCATION
- W — EXISTING HOSE BIB
- EXISTING PORTABLE IRRIGATION WATER PUMP
- WELL — EXISTING 6" WATER WELL
- EXISTING ELECTRICAL OUTLET
- P — EXISTING POWER POLE
- T — EXISTING TELEPHONE PEDESTAL
- CONTROL POINT
- PUMP
- PUMP
- TP — TEST PIT LOCATION

MISCELLANEOUS SYMBOLS

- CHANGE OF PIPE MTL
- OR — END OF PIPE
- ℄ — CENTERLINE
- Ø — DIAMETER
- ∠ — ANGLE
- PL — PLATE
- ± — PLUS/MINUS

GENERAL NOTES:

1. ALL SYMBOLS ARE NOT NECESSARILY USED. THIS IS A STANDARD DRAWING SHOWING COMMON SYMBOLS ON THIS PROJECT.
2. SCREENING OR SHADING OF WORK IS USED TO INDICATE EXISTING COMPONENTS OR TO DE-EMPHASIZE PROPOSED IMPROVEMENTS TO HIGHLIGHT SELECTED TRADE WORK. REFER TO CONTEXT OF EACH DRAWING FOR USAGE.

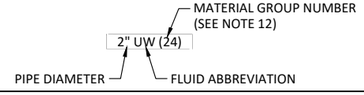
FLUID ABBREVIATION	FUNCTION	ALLOWABLE PIPING MATERIAL GROUP NO. (SEE NOTE 1 AND 4)				FIELD TEST REQUIREMENTS (SEE NOTE 3 AND NOTE 4)		
	THIS LIST MAY INCLUDE FLUIDS NOT USED IN THIS PROJECT	EXPOSED PIPING (SEE NOTE 14)		BURIED PIPING (SEE NOTE 13)		MINIMUM TEST PRESSURE PSI	TEST MEDIUM	LEAKAGE ALLOWANCE (SEE NOTE 2)
		3" DIA AND SMALLER	4" DIA AND LARGER	3" DIA AND SMALLER	4" DIA AND LARGER			
COMMONLY USED FUNCTIONS								
DR	DRAIN	2	2	2	2	NOTE 6	WATER	(D)
RW	RAW WATER	2,8	2,8	8	8	150	WATER	(A)

PIPING MATERIAL SCHEDULE (SEE NOTE 1)

GROUP NO.	PIPE MATERIAL	FITTINGS / JOINTS	LININGS AND COATINGS (SEE NOTE 13)
2	STEEL, ASTM A53, SCHEDULE 40, BLACK WELDED, GALVANIZED	2 1/2" AND SMALLER, MALLEABLE IRON, ASME B16.3, THREADED, BANDED, GALVANIZED 150 PSI. 3" AND LARGER, CAST IRON, ASME B16.1, 125 PSI FLANGED OR MECHANICAL COUPLING.	SEE SECTION 40 23 15
8	WELDED STEEL PIPE (AWWA C200 & MODIFIED PER SECTION 331111) (ALL PIPE CALLOUT DIAMETERS ARE 'ID' OF MORTAR LINING)	WELDED STEEL, AWWA C208 MODIFIED PER SECTION 331111, FABRICATED.	SEE SECTION 33 11 11

TYPICAL PIPE DESIGNATION:



NOTES:

NOTE 1
ALTHOUGH SEVERAL PIPE MATERIAL GROUPS MAY BE LISTED ON THIS SHEET FOR A GIVEN FLUID SERVICE, CONTRACTOR SHALL PROVIDE ONLY THE PIPE MATERIAL GROUP SHOWN ON THE DRAWINGS AND SPECIFIED FOR THAT FLUID SERVICE.

NOTE 2
LEAKAGE ALLOWANCE IS AS FOLLOWS
A. PIPES SO DESIGNATED SHALL SHOW ZERO LEAKAGE.
B. PIPES SO DESIGNATED SHALL SHOW ZERO LEAKAGE FOR UNBURIED PIPE AND NOT MORE THAN 0.02 GALLON PER HOUR PER INCH DIAMETER PER 100 FEET OF BURIED PIPE.
C. PIPES SO DESIGNATED SHALL NOT SHOW A LEAKAGE OF MORE THAN 0.15 GALLON PER HOUR PER INCH OF DIAMETER PER 100 FEET OF PIPE.
D. PIPES SO DESIGNATED SHALL NOT SHOW A LOSS OF PRESSURE OF MORE THAN 5 PERCENT.
E. PIPE SO DESIGNATED SHALL NOT SHOW A LOSS OF VACUUM OF MORE THAN 4 INCHES MERCURY COLUMN.

NOTE 3
FOR FIELD TEST PROCEDURES AND ADDITIONAL TEST REQUIREMENTS, SEE PIPING SECTION OF SPECIFICATIONS.

NOTE 4
NO SUBSTITUTIONS U.N.O. IN THE SPECIFICATIONS.

NOTE 5
NOT USED

NOTE 6
STATIC WATER TEST WITH SURFACE 5 FEET ABOVE HIGH POINT OF PIPE.

NOTE 7
INSPECTION AND TESTING SHALL BE IN ACCORDANCE WITH APPLICABLE PLUMBING CODE.

NOTE 8
NOT USED

NOTE 9
NOT USED

NOTE 10

GENERAL STRUCTURAL NOTES:
THE FOLLOWING NOTES ARE GENERAL AND APPLY TO THE ENTIRE PROJECT, UNLESS SPECIFICALLY NOTED OTHERWISE (UNO)

1) GENERAL:

A. CONSTRUCTION DOCUMENTS:
   1. THE CONTRACTOR SHALL REVIEW THE APPROVED CONTRACT DOCUMENTS AND NOTIFY THE ENGINEER OF ANY ERRORS OR DISCREPANCIES PRIOR TO THE START OF CONSTRUCTION.
   2. THE CONTRACTOR SHALL NOTIFY THE OWNER IMMEDIATELY IF ANY UNIDENTIFIED EXISTING UNDERGROUND UTILITIES ARE DISCOVERED.
   3. THE STRUCTURAL CONTRACT DRAWINGS REPRESENT THE FINISHED STRUCTURE. THEY DO NOT INDICATE THE METHOD OF CONSTRUCTION. THE CONTRACTOR SHALL PROVIDE ALL MEASURES NECESSARY TO PROTECT THE STRUCTURE DURING CONSTRUCTION. SUCH MEASURES SHALL INCLUDE, BUT ARE NOT LIMITED TO, BRACING AND/OR SHORING FOR LOADS DUE TO CONSTRUCTION EQUIPMENT, ETC.
   4. UNDER NO CIRCUMSTANCES CAN STRUCTURAL COMPONENTS BE SUBSTITUTED, OMITTED, OR ALTERED FROM THE APPROVED SET OF CONSTRUCTION DOCUMENTS WITHOUT WRITTEN APPROVAL FROM THE ENGINEER.

B. DIMENSIONS AND NOTATIONS:
   1. WRITTEN DIMENSIONS SHALL TAKE PRECEDENCE OVER SCALED DIMENSIONS. DO NOT SCALE DRAWINGS.
   2. ABBREVIATIONS USED ON THE APPROVED CONSTRUCTION DOCUMENTS SHALL BE CONSIDERED TYPICAL ABBREVIATIONS FOR THE INDUSTRY. THE CONTRACTOR SHALL BE RESPONSIBLE TO NOTIFY THE ENGINEER IMMEDIATELY OF ANY ABBREVIATIONS THAT ARE UNKNOWN TO THE CONTRACTOR.

C. TYPICAL NOTES AND DETAILS:
   1. SPECIFIC NOTES AND DETAILS SHALL TAKE PRECEDENCE OVER STANDARD TYPICAL NOTES AND DETAILS.
   2. STANDARD TYPICAL NOTES AND DETAILS ARE TO BE USED WHEN REFERRED TO OR WHEN NO OTHER MORE RESTRICTIVE OR DIFFERENT DETAILS ARE SHOWN ON THE DRAWINGS.
   3. WORK NOT PARTICULARLY SHOWN OR SPECIFIED SHALL BE THE SAME AS SIMILAR PARTS THAT ARE SHOWN OR SPECIFIED.

D. CODE REQUIREMENTS:
   1. ALL WORK SHALL CONFORM TO THE MINIMUM STANDARDS OF REGULATING AGENCIES WHICH MAY HAVE AUTHORITY OVER ANY PORTION OF THE WORK.
   2. SPECIFICATIONS, CODES AND STANDARDS NOTED SHALL BE OF THE LATEST APPROVED ISSUE, INCLUDING SUPPLEMENTS, UNLESS NOTED OTHERWISE.
   3. MINIMUM UNIFORM (BLANKET) ROOF SNOW LOAD, AS DEFINED BY LOCAL BUILDING OFFICIAL OR STATE, SHALL BE DESIGNED FOR, AND IT IS THE RESPONSIBILITY OF THE ENGINEER TO CONFIRM IF ONE EXISTS BY CONTACTING THE LOCAL BUILDING OFFICIAL.

E. DEFERRED SUBMITTALS:
   1. DEFERRED STRUCTURE SUBMITTAL ITEMS HAVE NOT BEEN PERMITTED UNDER THE BASE BUILDING APPLICATION.
   2. THE CONTRACTOR SHALL SUBMIT COMPONENT SYSTEM DOCUMENTS FOR DEFERRED SUBMITTAL ITEMS, STAMPED BY A PROFESSIONAL ENGINEER LICENSED IN THE JURISDICTION HAVING AUTHORITY, TO THE REGISTERED DESIGN PROFESSIONAL IN RESPONSIBLE CHARGE FOR REVIEW AND FORWARD THE REVIEWED DOCUMENTS TO THE BUILDING OFFICIAL IN COMPLIANCE WITH SECTION 107.3.4.1 OF THE CBC.
   3. DEFERRED SUBMITTAL ITEMS SHALL NOT BE INSTALLED UNTIL THE COMPONENT SYSTEM DOCUMENTS HAVE BEEN APPROVED BY THE BUILDING OFFICIAL.
   4. THE FOLLOWING CONTRACTOR-DESIGNED PROJECT ELEMENTS ARE DEFINED AS DEFERRED STRUCTURAL SUBMITTAL ITEMS:

      PRE-ENGINEERED METAL BUILDINGS

2) CODES, STANDARDS, AND REFERENCES:

A. ASCE 7-16: MINIMUM DESIGN LOADS AND ASSOCIATED CRITERIA FOR BUILDINGS AND OTHER STRUCTURES.
B. ACI 318-14: BUILDING CODE REQUIREMENTS FOR STRUCTURAL CONCRETE.
C. ACI 350-06: CODE REQUIREMENTS FOR ENVIRONMENTAL ENGINEERING CONCRETE STRUCTURES.
D. AISC 360-16 SPECIFICATION FOR STRUCTURAL STEEL BUILDINGS.

3) FOUNDATIONS AND GEOTECHNICAL:

A. GEOTECHNICAL DESIGN CRITERIA IS BASED ON THE RECOMMENDATIONS DOCUMENTED IN THE DESIGN DOCUMENTATION REPORT:

4) GRATING:

A. WEIGHT OF GRATING SECTION SHALL NOT EXCEED 80 LBS.
B. PROVIDE A MINIMUM OF 4 CLIPS PER GRATING PANEL, APPROX 4" FROM PANEL CORNERS.
C. WIDTH OF GRATING SECTIONS SHALL NOT EXCEED 3'-0".
D. SHOP DRAWINGS BASED ON FIELD DIMENSIONS SHALL BE SUBMITTED TO THE ENGINEER PRIOR TO FABRICATION.
E. PROVIDE GRATING FASTENERS AS REQUIRED.
F. THE HORIZONTAL CLEARANCE BETWEEN THE GRATING AND GRATING SUPPORTS SHALL NOT BE LESS THAN ¼" NOR GREATER THAN ½"
G. ALL GRATING SECTIONS, WHEN IN PLACE, SHALL ALWAYS BE FIRMLY ANCHORED TO THEIR SUPPORTS.
H. PROVIDE MINIMUM BEARING PER MANUFACTURERS RECOMMENDATIONS FOR ALL GRATING.

5) NON-SHRINK GROUT:
1. ALL GROUT WORK SHALL CONFORM TO THE LATEST EDITION OF ACI 301.
2. FORMWORK: DESIGN, ERECT, SUPPORT, BRACE AND MAINTAIN FORMWORK TO SUPPORT VERTICAL, LATERAL, STATIC AND DYNAMIC LOADS THAT MIGHT BE APPLIED UNTIL STRUCTURE CAN SUPPORT SUCH LOADS.

6) STRUCTURAL AND MISCELLANEOUS STEEL:

A. STRUCTURAL STEEL SHALL CONFORM TO THE FOLLOWING ASTM STANDARDS:
   a) WIDE FLANGE SHAPES — A992, GR 50 GALV
   b) OTHER SHAPES, PLATES, ANGLES AND BARS — A36 GALV
   c) STEEL PIPE — A53, GRADE B GALV
   d) HOLLOW STRUCTURAL SECTIONS — A500, GRADE B GALV
C. WELDS: PROVIDE 70KSI LOW HYDROGEN ELECTRODE OR PROCESS IN ACCORDANCE WITH AWS A5.1.
D. BOLTS, U.N.O.:
   1. STAINLESS STEEL: ASTM A193, GRADE 8, CLASS 2, AISI TYPE 316
H. DRILL AND EPOXY ANCHOR BOLTS:
   1. STAINLESS STEEL ASTM A193, GRADE 8, CLASS 2, AISI TYPE 316 OR EQUAL APPROVED BY ENGINEER
I. EPOXY BOLT OR EXPANSION BOLT SUBSTITUTIONS FOR EMBEDDED BOLTS IS PROHIBITED WITHOUT WRITTEN CONSENT FROM THE ENGINEER.
J. UNLESS NOTED OTHERWISE ON THE DRAWINGS, ALL EPOXY BOLTS SHALL BE AS SPECIFIED.
K. ALL STRUCTURAL STEEL SHALL BE DETAILED, FABRICATED, AND ERECTED IN ACCORDANCE WITH THE AISC CODE OF STANDARD PRACTICE, EXCEPT AS MODIFIED IN THESE NOTES AND THE PROJECT SPECIFICATIONS.
L. ALL STAINLESS STEEL SHALL BE TYPE 316.
M. SPLICING OF STEEL MEMBERS, UNLESS SHOWN ON THE DRAWINGS, IS PROHIBITED WITHOUT WRITTEN APPROVAL OF THE PROJECT ENGINEER.
N. GALVANIC PROTECTION SHALL BE PROVIDED BETWEEN DISSIMILAR METALS.
O. WELDING SHOWN FOR STAINLESS STEEL ELEMENTS SHALL COMPLY WITH AWS D1.6/D1.6M.

7) CONCRETE:

A. ALL CONCRETE WORK SHALL CONFORM TO THE LATEST EDITION OF ACI 301 AND ACI 117, EXCEPT AS MODIFIED BY THE FOLLOWING SUPPLEMENTAL REQUIREMENTS:
B. ALL CONCRETE SHALL BE NORMAL WEIGHT CONCRETE.
C. CONCRETE MIX DESIGN SHALL BE ESTABLISHED IN ACCORDANCE WITH CHAPTER 5 OF ACI 350.
D. COMPRESSIVE STRENGTH (28 DAYS)
   F'C — 4,500 PSI
E. REINFORCEMENT FOR CONCRETE:
1. ALL REINFORCING SHALL BE SUPPORTED IN FORMS SPACED WITH NECESSARY ACCESSORIES AND SHALL BE SECURELY WIRED TOGETHER IN ACCORDANCE WITH THE LATEST EDITION OF THE CRSI "MANUAL OF STANDARD PRACTICE"
2. CLEAR COVER
   a) CONCRETE CAST AGAINST EARTH = 3"
   b) ALL OTHER CONCRETE, UNO = 2"
F. SLAB-ON-GRADE REINFORCEMENT SHALL BE PLACED AT THE MID-DEPTH OF THE SLAB, UNO.
G. FORMWORK: DESIGN, ERECT, SUPPORT, BRACE AND MAINTAIN FORMWORK TO SUPPORT VERTICAL, LATERAL, STATIC AND DYNAMIC LOADS THAT MIGHT BE APPLIED UNTIL STRUCTURE CAN SUPPORT SUCH LOADS.

8) ALUMINUM:

A. ALL ALUMINUM WORK SHALL CONFORM TO THE LATEST EDITION OF THE ALUMINUM DESIGN MANUAL BY THE ALUMINUM ASSOCIATION.
B. UNLESS OTHERWISE INDICATED, ALUMINUM METALWORK SHALL BE FABRICATED FROM ALLOY 6061-T6, EXCEPT GRATING WHICH SHALL BE PER DESIGN.

9) REINFORCEMENT:

A. ASTM A615 - FY = 60,000 PSI
B. SEE SPECIFICATIONS FOR REINFORCING PLACEMENT REQUIREMENTS.
C. ABSOLUTELY NO WELDING OF REINFORCING BARS OR TORCHING TO BEND REINFORCING BARS SHALL BE ALLOWED WITHOUT SPECIFIC APPROVAL FROM THE STRUCTURAL ENGINEER.

10) TESTS AND INSPECTIONS:

A. INSPECTIONS
   1. CONSTRUCTION SHALL BE SUBJECT TO INSPECTION BY THE BUILDING OFFICIAL OR THE AUTHORITY HAVING JURISDICTION AND SUCH CONSTRUCTION OR WORK SHALL REMAIN ACCESSIBLE AND EXPOSED FOR INSPECTION PURPOSES UNTIL APPROVED.
   2. THE CONTRACTOR IS RESPONSIBLE TO NOTIFY THE BUILDING OFFICIAL OR THE AUTHORITY HAVING JURISDICTION WHEN WORK IS READY FOR INSPECTION. IN ADDITION, THE CONTRACTOR IS RESPONSIBLE TO PROVIDE ACCESS TO AND MEANS FOR INSPECTIONS OF SUCH WORK THAT ARE REQUIRED BY THE BUILDING OFFICIAL OR AUTHORITY HAVING JURISDICTION.

B. STATEMENT OF SPECIAL INSPECTIONS
   1. THE DESIGN ENGINEER HAS PREPARED AND SUBMITTED A STATEMENT OF SPECIAL INSPECTIONS TO THE BUILDING OFFICIAL SPECIFYING THE SCOPE OF WORK TO BE INSPECTED BY A SPECIAL INSPECTION AGENCY (IN ADDITION TO THE INSPECTIONS BY THE BUILDING OFFICIAL OR AUTHORITY HAVING JURISDICTION) TO SATISFY THE REQUIREMENTS OF THE CALIFORNIA BUILDING CODE, SECTION 1704. THE CONTRACTOR SHALL REVIEW THIS DOCUMENT AND SUBMIT A WRITTEN STATEMENT OF RESPONSIBILITY TO THE BUILDING OFFICIAL AND OWNER (OR THE OWNER'S AUTHORIZED AGENT) PRIOR TO COMMENCEMENT OF THE WORK THAT ACKNOWLEDGES AWARENESS OF THE REQUIREMENTS CONTAINED IN THE STATEMENT OF SPECIAL INSPECTIONS.
   2. THE CONTRACTOR IS RESPONSIBLE FOR COORDINATING THEIR WORK WITH THE SPECIAL INSPECTION AGENCY. THE CONSTRUCTION OR WORK FOR WHICH SPECIAL INSPECTION OR TESTING IS REQUIRED SHALL REMAIN ACCESSIBLE AND EXPOSED FOR SPECIAL INSPECTION AND TESTING PURPOSES UNTIL COMPLETION OF THE REQUIRED SPECIAL INSPECTIONS OR TESTS.

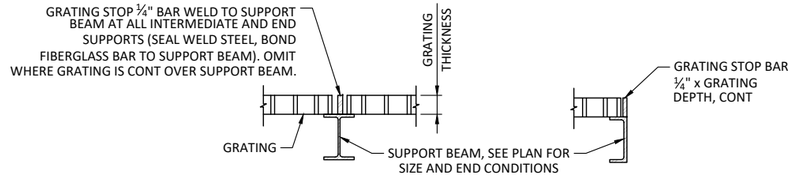
GRATING CLIP DETAIL



GRATING STOP DETAIL

NOTES:
1. UNLESS INDICATED OTHERWISE, ALL GRATING SHALL BE ALUM.
2. GRATING DEPTH TO BE DETERMINED BY MANUFACTURER AND APPROVED BY ENGINEER, UNO.
3. ALL ENDS AND OPENINGS SHALL BE BANDED.
4. WEIGHT OF GRATING SECTION SHALL NOT EXCEED 80 LBS.
5. METAL BEARING BARS SHALL BE DEPTH T x 3⁄16" @ 1 3⁄16" OC.. CROSS BARS SHALL BE @ 4" OC.
6. PROVIDE A MINIMUM OF 4 CLIPS PER GRATING PANEL, APPROX 4" FROM PANEL CORNERS. MAXIMUM CLIP SPACING AT 36" OC.
7. MATERIALS:
   - A. ALUM GRATING - USE ALUM ANGLE SUPPORTS AND SST BOLTS AND CLIPS. IF SUPPORTED BY STEEL BEAMS, USE STEEL STOP BARS. ALUM IN CONTACT WITH CONC OR STEEL SHALL BE COATED PER THE PROTECTIVE COATING SPECS.
   - B. GALV STEEL GRATING - USE STEEL ANGLE SUPPORTS, BOLTS AND CLIPS. GALV AFTER FABRICATION.
   - C. SST GRATING - USE SST ANGLE SUPPORTS, BOLTS AND CLIPS
   - D. FIBERGLASS GRATING - USE FIBERGLASS FOR ALL COMPONENTS EXCEPT DRILLED ANCHORS; ALL CUT EDGES SHALL BE SEALED WITH RESIN; BONDING: USE EPOXY ADHESIVE BONDING AGENT

GRATING FRAME TABLE SIZED TO MATCH GRATING (FOR FIBERGLASS USE CONTINUOUS PROTRUDED FIBERGLASS SEAT & ANCHOR)

NOTES:
1. WHEN SUPPORTING PIPE AND FLANGE ALTERNATELY ON THE SAME LINE, CONCRETE PIERS FOR PIPE SUPPORTS SHALL ALL HAVE THE SAME DIMENSION 'H' FOR FLANGE SUPPORT
2. PIPE SUPPORTS SHALL BE LOCATED IN PLAN AT POINTS MARKED THUS: (X)
3. WHERE DIFFERENTIAL SETTLEMENT IS LIKELY TO OCCUR, OMIT GROUT AS DIRECTED BY THE ENGINEER.
4. GALVANIZE ALL PARTS AFTER FABRICATION.
5. WHERE DIRECTED BY THE STRUCTURAL ENGINEER, BOTTOM OF PIERS SHALL EXTEND BELOW BOTTOM OF SLAB
6. WHERE PIPE SUPPORT OCCURS ON GRADE REFER TO STRUCTURAL DRAWINGS FOR DETAILS.
7. GALVANIZED ANCHOR BOLT OR CONCRETE ANCHOR WITH TWO NUTS AND ONE LOCKWASHER. PROVIDE BAR 4x½x4" WELDED TO BOLT, TYP OF 4. SEE SPECIFICATIONS.

METERING SYSTEMS AND DEVICES INDEX

A	AMMETER
AH	AMPERE HOUR METER
AS	AMMETER SELECTOR SWITCH
C	COUNTER
CMA	CONTACT MAKING AMMETER
CMC	CONTACT MAKING CLOCK
CMV	CONTACT MAKING VOLTMETER
CS	CONTROL STATION
DM	DEMAND METER
ETM	ELAPSE TIME METER
F	FREQUENCY METER
G	GALVANOMETER
GD	GROUND FAULT DETECTOR
KV	KILO-VOLTMETER
KW	KILO-WATTMETER
KWH	KILO-WATT HOUR METER
mA	MILLI-AMMETER (TRANSDUCER)
MOC	MECHANISM-OPERATED CONTACT
OHM	OHMMETER
OSC	OSCILLOGRAPH
PB	PUSHBUTTON
PF	POWER FACTOR METER
PH	PHASE METER
PI	POSITION INDICATOR
REC	RECORDER
RF	REACTIVE FACTOR METER
RPM	SPEED INDICATOR
SW	TRANSFER SWITCH
SY	SYNCHROSCOPE
T	TEMPERATURE METER
TLM	TELEMETER
TOC	TRUCK-OPERATED CONTACT
TS	TIME SWITCH
V	VOLTMETER
VAR	VARMETER
VH	VAR HOUR METER
VS	VOLTMETER SELECTOR SWITCH
W	WATTMETER
WH	WATT HOUR METER
WHDM	WATT HOUR DEMAND METER

NOTE: "R" IN FRONT OF LETTERS INDICATES A RECORDING TYPE METER.

PILOT - INDICATOR LIGHT INDEX

A	AMBER
B	BLUE
C	CLEAR
G	GREEN
NE	NEON
O	ORANGE
OP	OPALESCENT
P	PURPLE
R	RED
W	WHITE
Y	YELLOW

FIRST LETTER SUFFIX OF IEEE DEVICE DESIGNATION

A	GOVERNOR SYSTEM (OR ACTUATOR SYSTEMS - GATES)
B	BATTERY CHARGING AND MONITORING SYSTEM OR BUS
C	HIGH-VOLTAGE CABLE SYSTEM OR CLOSING RELAY/CONTACTOR
D	DATA ACQUISITION SYSTEM
E	EXCITATION SYSTEM INCLUDING TRANSFORMER AND REGULATOR BUT NOT MAIN FIELD
F	FIRE AND CO2 SYSTEM
G	MAIN GENERATOR INCLUDING AUXILIARY SYSTEMS OR GROUND
G/M	GENERATOR MOTOR INCLUDING AUXILIARY SYSTEMS IN PUMPED STORAGE APPLICATIONS
H	TURBINE OR MAIN PUMP INCLUDING AUXILIARY SYSTEMS
I	ISOLATED AND OTHER POWER BUS SYSTEMS (NOT HIGH VOLTAGE CABLE)
J	POWER CIRCUIT BREAKER INCLUDING AUXILIARY SYSTEMS
K	POWER TRANSFORMER INCLUDING AUXILIARY SYSTEMS
L	ANNUNCIATOR SYSTEM, SECURITY SYSTEM, LINE, OR LOWERING RELAY/CONTACTOR
M	MAIN PUMP MOTOR INCLUDING AUXILIARY SYSTEMS AND VARIABLE SPEED DRIVE
N	AIR (PNEUMATIC) SYSTEM OR NEUTRAL
O	OPENING RELAY/CONTACTOR
P	PENSTOCK OR DISCHARGE LINE SYSTEM
Q	OIL STORAGE, HANDLING, PURIFICATION SYSTEM
R	FIELD FLASHING SYSTEM, PHASE REVERSAL SWITCH INCLUDING AUXILIARY SYSTEM, OR RAISING RELAY/CONTACTOR
S	STATION SERVICE SUBSTATION SYSTEM INCLUDING ENGINE/GENERATOR SYSTEM
T	TONE AND TRANSFER TRIP SYSTEM OR TRANSFORMER
U	UNIT CONTROL CIRCUIT SYSTEM OR UNINTERRUPTIBLE POWER SUPPLY SYSTEM
V	INTAKE AND/OR DISCHARGE VALVE SYSTEM
W	WATER SYSTEMS INCLUDING INTAKE/OUTLET WORKS AND PLANT WATER AND SUMP SYSTEMS
X	DEFINED FOR SYSTEMS UNIQUE TO A FACILITY
Y	DEFINED FOR SYSTEMS UNIQUE TO A FACILITY
Z	DEFINED FOR SYSTEMS UNIQUE TO A FACILITY

SECOND AND SUBSEQUENT LETTER SUFFIXES OF THE IEEE DEVICE DESIGNATION

A	ABNORMAL, A.C., ACCELERATION, ADMISSION, ALARM, AMPERES, AUTOMATIC, AUXILIARIES, PHASE A, ECT.
B	BACKUP, BEARING, BLOCK, BLOWER, BOOSTER, BRAKES, BUS, BUTTON, BYPASS, PHASE B, ETC.
C	CABLE, CARRIER, CHARGER, CHECK, CHLORINATION, CLOSE, COLLECTOR, COMMON, COMPENSATOR, COMPRESSOR, CONTROL, COOLING, CURRENT, CYCLE, CYLINDER, PHASE C, CONVEYOR, ECT.
D	D.C, DECELERATION, DELAY, DEPRESS, DETECTOR, DIELECTRIC, DIFFERENTIAL, DISCHARGE, DISCONNECT, DISCORDANCE, DOMESTIC, DOWN, DOWNSTREAM, DRAFT TUBE, DRAIN, ETC.
E	EJECTOR, ELEVATOR, EMERGENCY, EXPLOSIVE, ETC.
F	FAILURE, FAN, FAULT, FEEDER, FIELD, FILTER, FIRE, FLAME, FLOW, FOLLOWER, FORWARD, FREQUENCY, FULL, FUMES, FUSE, ETC.
G	GAS, GATE, GATING (SCR), GENERATE, GROUND, GUIDE BEARING, ETC.
H	HALON, HAND, HEAT, HEATER, HIGH, HOIST, HORN, HOT, HOUSING, HYDROPNEUMATIC TANK, ETC.
I	INDICATION, INITIAL, INLET, INOUT, INSTANTANEOUS, INTAKE, INTERFACE, INTERLOCK, INTERRUPT, INVERTER, IONIZATION, ETC.
J	JACKING, JET, ETC.
K	KEY, TRANSFORMER
L	LAMPS, LEFT, LEVEL, LIGHTS, LIMITS, LINE, LIQUID, LOCAL, LOGIC, LOSS, LOUVERS, LOW, LOWER, LUBRICATION, ETC.
M	MAIN, MALFUNCTION, MANUAL, METER, METERING, MOTOR, ETC.
N	NEGATIVE, NETWORK, NEUTRAL, NORMAL, ETC.
O	OPEN, OUTLET, OUTPUT, ETC.
P	PACKING BOX, PARALLEL, PARAMETER, PENSTOCK, PHASE, PHASEBACK, PILOT, PIT, POSITION, POTENTIAL, POTHEAD, POWER, PRESSURE, PRIMARY, PROTECTION, PULSE, PUMP, PURIFICATION, PUSH, ETC.
Q	OIL, ETC.
R	RAISE, REACTOR, RECLOSE, RECORD, RECTIFIER, REED, REFRIGERATION, REGULATE, RELAY, RELEASE, RELIEF, REMOTE, RESERVOIR, RESET, RESISTOR, RIGHT, ROTATION, ROTOR, RUNNER, ETC.
S	SEALS, SECONDARY, SELECTOR, SEWAGE, SHORTING, SHUTDOWN, SIGNAL, SKIMMER, SLUDGE, SMOKE, SOLENOID, SPEED, SPIRAL OR SCROLL CASE, SPLICE, STABILIZER, STANDBY, STARTING, STATOR, STEPPING, STORAGE, STRAINER, SUCTION, SUMP, SUPPLY, SWITCH, SYNCHRONIZING, ETC.
T	TANK, TEMPERATURE, TEST, THERMAL, THRUST BEARING, THYRATRON, TIE, TIME, TRANSDUCER, TRANSER, TRANSMITTER, TRIP, TROUBLE, TRASHRAKE, ETC.
U	UNIT, UNLOADER, UNWATERING, UP, UPPER, UPSTREAM, ETC.
V	VALVE, VARS, VIBRATION. VOLTAGE, ETC.
W	WATER, WATTS, WINDINGS, ETC.
X	AUXILIARY DEVICE, ETC.
Y	AUXILIARY TO DEVICE X, ANTIPUMP RELAY, ETC.
Z	AUXILIARY TO DEVICE Y

ABBREVIATIONS

A, AMP	AMP, AMPERE
AAAC	ALL ALUMINUM ALLOY CONDUCTOR
AC	ALTERNATING CURRENT
AF	AMPERE FRAME SIZE
AFD	ADJUSTABLE FREQUENCY DRIVE
AFF	ABOVE FINISHED FLOOR
AH	AMPERE HOURS
AHJ	AUTHORITY HAVING JURISDICTION
AHU	AIR HANDLING UNIT
AL	ALUMINUM
A/R	AS REQUIRED
AT	AMPERE TRIP
ATS	AUTOMATIC TRANSFER SWITCH
AVR	AUTOMATIC VOLTAGE REGULATOR
BAT	BATTERY
C	CONDUIT
CB	CIRCUIT BREAKER
CKT	CIRCUIT
CLF	CURRENT LIMITING FUSE
CO	CONDUIT ONLY
CP	CONTROL PANEL

Appendix B. Class 4 Opinion of Probable Construction Costs

This page intentionally left blank.

Technical Memorandum			
To:	Mike Brodie, P.E. Chugach Electric Association	Project:	Eklutna Fish & Wildlife Project
From:	Sean P. Ellenson, P.E. McMillen, Inc	cc:	Curtis Neibaur McMillen, Inc
Prepared by:	Paul Rader McMillen, Inc	Job No.:	22-028
Date:	October 6, 2023		
Subject:	Class 4 Opinion of Probable Construction Costs - Eklutna River Release Facility		

Revision Log

Revision No.	Date	Revision Description
0	October 6, 2023	Initial Draft

1.0 Introduction

1.1 Purpose

This technical memorandum (TM) presents a summary of the Opinion of Probable Construction Costs (OPCC) for the Eklutna River Release Facility as part of the Eklutna Fish & Wildlife Project. The OPCC estimates are based on the 15% Design drawing package dated October 6, 2023.

1.2 Background

The Eklutna Hydroelectric Project (Project) is located in Southcentral Alaska approximately 30 miles northeast of downtown Anchorage near the Native Village of Eklutna (NVE). The Project was originally constructed by the Federal government in the 1950s but was later sold to, and is currently owned by, the Municipality of Anchorage (MOA), Chugach Electric Association, Inc. (Chugach), and the Matanuska Electric Association (MEA), collectively the “Project Owners”. As part of the sale of the Project, the current Project Owners entered into the 1991 Fish and Wildlife Agreement (1991 Agreement) with the National Marine Fisheries Service (NMFS), U.S. Fish and Wildlife Service (USFWS), and the State of Alaska (the Parties). The 1991 Agreement requires the Project Owners to develop and propose to the Governor of Alaska (Governor) a program to protect, mitigate damages to, and enhance fish and wildlife impacted by the development of the Project.

In development of the program, the Project Owners have met with various stakeholders to identify protection, mitigation, and enhancement measures that may be implemented within the Project study area. These measures were incorporated into a Phase 1 Engineering Feasibility Study which advanced the preliminary design, estimated capital expenditures, and determined operations and maintenance costs for each alternative for the purposes of evaluation. Selected measures from the Phase 1 Engineering Feasibility Study have been advanced to a Phase 2 Engineering Feasibility Study which includes a 15% level of design and a Class 4 OPCC.

1.3 Estimation Preparation

McMillen has utilized historical cost data from similarly technical projects which we have designed or constructed as a self-performing general contractor, as the basis of our Class 4 OPCC estimate. Appropriate overhead and profit markups have been included below the subtotal to account for the competitive bidders' markups, they are likely to apply on their bid prices. A 20% contingency has been included at this stage to account for details and minor project features which are not yet included in the project documents at the 15% Design level of detail. The contingency value may be reduced in future versions of the OPCC estimate, as the project design is advanced.

General requirement and mobilization costs are estimated at 12% and 8% of construction activity costs based on historical project ranges. Overhead and profit markups have been included at 10% and 5% respectively of direct construction costs. The estimate is in 2023 dollars. No escalation is included in the pricing. This OPCC estimate is consistent with a Class 4 estimate as defined by the AACE classification system, as shown in Figure 1-1 and 1-2. For the purposes of this project, McMillen has utilized the accuracy range of -30% to +50%.

CLASS 4 ESTIMATE	
Description: Class 4 estimates are generally prepared based on limited information and subsequently have fairly wide accuracy ranges. They are typically used for project screening, determination of feasibility, concept evaluation, and preliminary budget approval. Typically, engineering is from 1% to 15% complete, and would comprise at a minimum the following: plant capacity, block schematics, indicated layout, process flow diagrams (PFDs) for main process systems, and preliminary engineered process and utility equipment lists. **Level of Project Definition Required:** 1% to 15% of full project definition. **End Usage:** Class 4 estimates are prepared for a number of purposes, such as but not limited to, detailed strategic planning, business development, project screening at more developed stages, alternative scheme analysis, confirmation of economic and/or technical feasibility, and preliminary budget approval or approval to proceed to next stage.	**Estimating Methods Used:** Class 4 estimates virtually always use stochastic estimating methods such as equipment factors, Lang factors, Hand factors, Chilton factors, Peters-Timmerhaus factors, Guthrie factors, the Miller method, gross unit costs/ratios, and other parametric and modeling techniques. **Expected Accuracy Range:** Typical accuracy ranges for Class 4 estimates are -15% to -30% on the low side, and +20% to +50% on the high side, depending on the technological complexity of the project, appropriate reference information, and the inclusion of an appropriate contingency determination. Ranges could exceed those shown in unusual circumstances. **Effort to Prepare (for US$20MM project):** Typically, as little as 20 hours or less to perhaps more than 300 hours, depending on the project and the estimating methodology used. **ANSI Standard Reference Z94.2-1989 Name:** Budget estimate (typically -15% to + 30%). **Alternate Estimate Names, Terms, Expressions, Synonyms:** Screening, top-down, feasibility, authorization, factored, pre-design, pre-study.

Figure 1-1: Class 4 Estimate Description

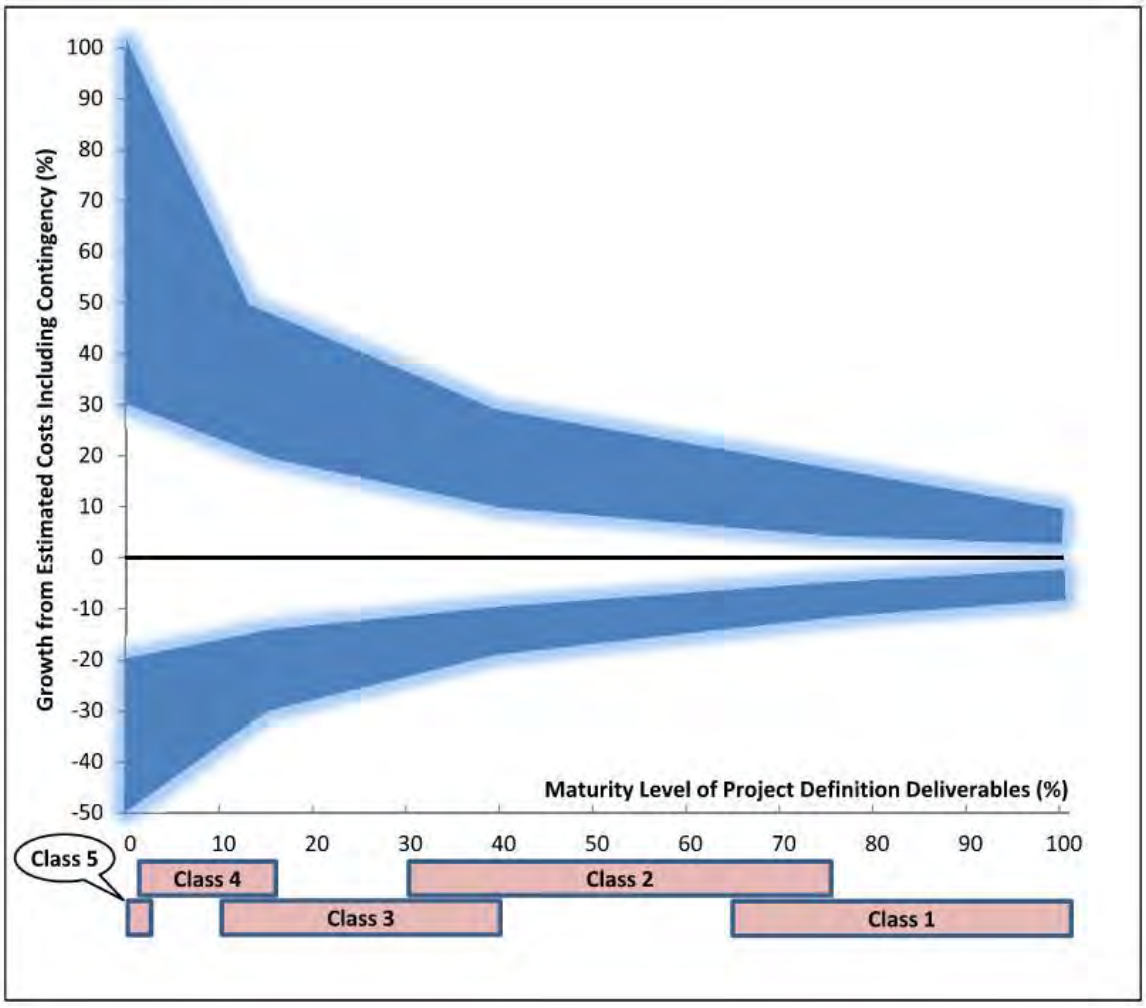

Figure 1-2: Variable in Accuracy Ranges (AACE 69R-12)

2.0 Project Cost Estimate

This OPCC estimate is consistent with a Class 4 estimate as defined by the Association for the Advancement of Cost Engineering (AACE) standard practice 69R-12. The maturity level of the project definition warrants a wide range of potential growth as the project design progresses. The Eklutna feasibility OPCC is based on 15% Design Drawings.

2.1 Cost Assumptions and Qualifications

The cost estimate was primarily developed utilizing costs from past projects and estimates. Below is a summary of the cost basis including any assumptions necessary for cost estimating purposes at this stage of design.

Common Cost Basis:

- General requirement and mobilization costs are based on a typical percentage of total direct construction costs: 12% and 8% respectively.
- Overhead & profit are added to direct construction costs at 10% and 5% respectively.
- A 20% contingency is added to the costs which is a typical contingency at the early concept phase of a project.
- Site access and laydown areas were all based on a unit price of $160k per acre for 0.3 acres.
- All steel buildings priced at $200/sf.
- All handrail and grating costs are based on recent supply and install estimates.
- All vaults and shafts require shoring to construct.
- Excavation spoils can be disposed of nearby the location of excavation or re-used as fill material for the new bridge approaches.
- All electric controls are assumed to include a PLC for semi-automatic control capabilities along with standard instrumentation readouts.
- Electrical overhead and underground transmission costs provided by MEA.
- Transformer costs are provided by MEA.

	Project Subtotal					**$7,342,007**

AACE International CLASS 4 Cost Estimate - Class 4 estimates are generally prepared based on limited information and subsequently have fairly wide accuracy ranges. They are typically prepared for a number of purposes, such as but not limited to, detailed strategic planning, business case development, project screening at more developed stages, alternative scheme analysis, confirmation of economic and/or technical feasibility, selection of a feasible alternative and preliminary budget approval to proceed to next stage of the project (definition phase). Typically, engineering is from 1% to 15% complete, and would comprise at a minimum the following: Feasibility design for several alternative layouts to include design criteria, generation capacity, feasibility level drawings, preliminary one-line diagrams, and comprehensive user requirements. Class 4 estimates generally use stochastic estimating methods such as cost/capacity graphs or curves and factors, historical data and other parametric and modeling techniques. Typical accuracy ranges for Class 4 estimates are -15% to -30% on the low side, and +20% to +50% on the high side, depending on the technological complexity of the project, appropriate reference information, and other risks (after inclusion of an appropriate contingency determination). Ranges could exceed those shown if there are unusual risks.

Assumptions:
(1) Flow released through valve year-round
(2) Facility operator is required to visit the site twice per week.
(3) The valve will be fitted with an instrumentation system capable of automated valve position changes to accommodate lake level fluctuations.
(4) Power consumption is estimated based on daily valve position changes and general site power consumption.
(5) A one week outage was assumed for performing inspection and maintenance of the valve shaft.
(6) Electrical and mechanical maintenance support assumes ongoing support for valves and instrumentation system.
(7) Facility operator is a trained local operator with general mechanical skills.
(8) Labor Wages Per State of Alaska Minimum Rates of Pay; September 2023

	Class	Monthly	Hourly
Trap Operator/Truck Driver	A2106		$ 70.64
Trap Technician - Biological Technician	S1201		$ 68.86
Electrician	A0707		$ 84.45
Mechanic - Maint. & Ops. Supervisor	A1601		$ 75.04

FOR IMMEDIATE RELEASE
April 25, 2024

Proposed Final Fish and Wildlife Program sent to Governor

Proposal calls for returning water, creating habitat in Eklutna River

After five years of study, analysis, and stakeholder engagement, Chugach Electric Association, Inc. (Chugach) and Matanuska Electric Association, Inc. (MEA), two of the owners of the Eklutna Hydroelectric Project, have sent the Proposed Final Fish and Wildlife Program (proposed final program) to Governor Mike Dunleavy for his consideration and approval. The submittal follows resolutions approving the proposed final program by the boards of directors of both Chugach and MEA.

The Eklutna Hydroelectric Project is the lowest cost power in Southcentral Alaska. It produces approximately 44% of MEA's renewable generation portfolio and approximately 25% of Chugach's renewable generation portfolio, increases electric grid reliability, and offsets approximately 72,500 metric tons of CO2 equivalent each year. The reservoir also supplies about 90% of the domestic water supply for the Municipality of Anchorage (MOA).

In 1997, Chugach, MEA, and the MOA purchased the hydro project from the federal government. As part of the purchase process, the project owners entered into what's called the 1991 Agreement with the National Marine Fisheries Service, U.S. Fish and Wildlife Service, and the State of Alaska to study the project's impact on fish and wildlife.

The 1991 Agreement required the project owners to initiate a consultation process with the signatories by 2022 to develop and propose to the governor a program to protect, mitigate damages to, and enhance fish and wildlife resources impacted by the project. The project owners initiated that process more than three years early in 2019, expanding the consultation process to include not only the parties to the 1991 Agreement, but also the Native Village of Eklutna (NVE), Eklutna, Inc., The Conservation Fund, Trout Unlimited, Alaska Pacific University, and several other stakeholders interested in the project.

Over the past five years, the project owners, working with stakeholders, compiled and summarized all relevant and existing information, identified information gaps, developed study plans, and conducted two years of studies in the Eklutna River basin. A total of 16 environmental and engineering studies were completed along with a comprehensive alternatives analysis to guide the project owners in the development of a draft program.

After the draft program was released on Oct. 27, 2023, the project owners met with the signatories of the 1991 Agreement and with NVE multiple times in an attempt to resolve differences. In January 2024, six public meetings were held in Anchorage, Eagle River, and

Palmer where over 200 people attended and were provided the opportunity to ask questions and submit comments.

After reviewing all of the comments received, the Project Owners made substantive revisions to the program reflecting negotiations with the parties to the 1991 Agreement and NVE, and are submitting the proposed final program to the Governor. The proposed final program includes the following:

- Construction of the Eklutna River Release Facility and establishment of year-round instream flows in the Eklutna River;
- Automation of the existing outlet gate at the dam to provide periodic channel maintenance flows in the Eklutna River;
- Construction of eight new bridges along the Anchorage Water and Wastewater Utility (AWWU) access road to enable AWWU's access to critical infrastructure year-round following the establishment of instream flows;
- Payment to Chugach State Park for lakeside trail repairs;
- Establishment of a Committee to oversee implementation of the Monitoring and Adaptive Management Plan;
- Funding to conduct monitoring studies in the Eklutna River throughout the 35-year program;
- Funding for physical habitat enhancement in the Eklutna River based on the monitoring results;
- Procedures for the Committee to adaptively manage the flow regime in the Eklutna River based on the monitoring results;
- Provisions for banking water in Eklutna Lake and potentially increasing the water budget for instream flows in the future;
- Potential installation of a fixed wheel gate to accommodate higher inflows in the future and/or allow higher channel maintenance flows if needed; and
- Potential installation of upstream and downstream fish passage facilities that meet specific criteria in the plan.

Approval of the Proposed Final Program will enable the Project Owners to implement these significant fish and wildlife measures at the Project, while simultaneously protecting the municipal water supply and continuing to provide firm, low cost, renewable energy to Southcentral Alaska.

The submittal of the proposed final program to Gov. Dunleavy triggers a 60-day comment period for the 1991 Agreement signatories, followed by a 30-day comment period for the owners. The 1991 Agreement, in giving final authority for the mitigation program to the governor, calls for equal consideration to be given to:

- Efficient and economical power production
- Energy conservation
- Fish and wildlife
- The protection of recreational opportunities

- Municipal water supplies
- The protections of other aspects of environmental quality
- Other beneficial public uses
- The requirements of State law

Although representatives of the MOA, through Anchorage Hydropower, have participated at every step in the process required by the 1991 Agreement for the past five years, the MOA is not participating in the submittal to the Governor. In October 2020, as part of the acquisition of Municipal Light & Power by Chugach, the MOA surrendered its voting rights on the Eklutna Hydroelectric Project and the 1991 Agreement matters until the MOA acquires necessary utility managerial and technical expertise that is approved by the Regulatory Commission of Alaska (RCA). That process has not yet occurred, so according to RCA's orders, the Municipality continues to have no voting rights and cannot participate in or delay decisions related to implementation of the 1991 Agreement at this time.

The final program is posted at www.eklutnahydro.com.

1.0 Introduction

The Eklutna Hydroelectric Project (Project) is located in Southcentral Alaska, approximately 30 miles northeast of downtown Anchorage near the Native Village of Eklutna (NVE). The federal government completed construction of the Project in 1955. Decades later, Chugach Electric Association, Matanuska Electric Association, and the Municipality of Anchorage (collectively the "Project Owners") agreed to purchase the Project and entered into a Purchase Agreement with the federal government in 1989. Shortly thereafter, concerns were raised about the Project's potential impacts on fish and wildlife. This led to the execution of a binding agreement in 1991 (referred to as the "1991 Agreement") amongst the Project Owners, National Marine Fisheries Service (NMFS), U.S. Fish and Wildlife Service (USFWS), and the State of Alaska (collectively the "Parties") that requires the Project Owners to (1) study the Project's impacts to fish and wildlife, (2) develop proposals for the protection, mitigation, and enhancement of fish and wildlife affected by the development of the Project, (3) consider the impact of fish and wildlife measures on electric rate payers, municipal water utilities, recreational users and adjacent land use, and (4) identify available means to mitigate these impacts. The Project Owners must repeat this process every 35 years and it replaces regulation by the Federal Energy Regulatory Commission. The sale of the Project was authorized by U.S. Congress in 1995, and the Project was sold to the Project Owners in October 1997.

Per the 1991 Agreement, the Project Owners were required to initiate this process no later than 25 years after the sale of the Project. Since the Project was sold in October 1997, the Project Owners were not required to initiate this process until October 2022. However, in order to allow adequate time for a comprehensive analysis, the Project Owners initiated the process in March 2019, more than three years early. After several years of study and consultation with all interested stakeholders detailed in the Supporting Information Document, the Project Owners issued a Draft Fish and Wildlife Program (Draft Program) as required in the 1991 Agreement in October 2023. The Project Owners met with the Parties and the Native Village of Eklutna several times from December 2023 through March 2024 to attempt to resolve differences. They also held six public meetings in January 2024 to solicit public comments. After considering all comments received, and giving due weight to the recommendations and expertise of the Parties and the Native Village of Eklutna, the Project Owners have developed this Proposed Final Fish and Wildlife Program (Proposed Final Program) for submittal to the Governor.

Accordingly, the Project Owners are excited for the next phase of the Project. Details of the Proposed Final Program are described in subsequent sections and include the following:

- Construction of the Eklutna River Release Facility and establishment of year-round instream flows in the Eklutna River;
- Automation of the existing outlet gate at the dam to provide periodic channel maintenance flows in the Eklutna River;
- Construction of eight new bridges along the Anchorage Water and Wastewater Utility (AWWU) access road to enable AWWU's access to critical infrastructure year-round following the establishment of instream flows;
- Payment to Chugach State Park for lakeside trail repairs;
- Establishment of a Committee to oversee implementation of the Monitoring and Adaptive Management Plan;
- Funding to conduct monitoring studies in the Eklutna River throughout the 35-year program;
- Funding for physical habitat enhancement in the Eklutna River based on the monitoring results;
- Procedures for the Committee to adaptively manage the flow regime in the Eklutna River based on the monitoring results;
- Provisions for banking water in Eklutna Lake and potentially increasing the water budget for instream flows in the future;
- Potential installation of a fixed wheel gate to accommodate higher inflows in the future and/or allow higher channel maintenance flows if needed; and
- Potential installation of upstream and downstream fish passage facilities that meet specific criteria.

Approval of the Proposed Final Program will enable the Project Owners to implement these significant fish and wildlife measures at the Project, while simultaneously protecting the municipal water supply and continuing to provide low cost, renewable energy to Southcentral Alaska. The Project Owners anticipate the Governor's issuance of a Final Fish and Wildlife Program by October 2024.

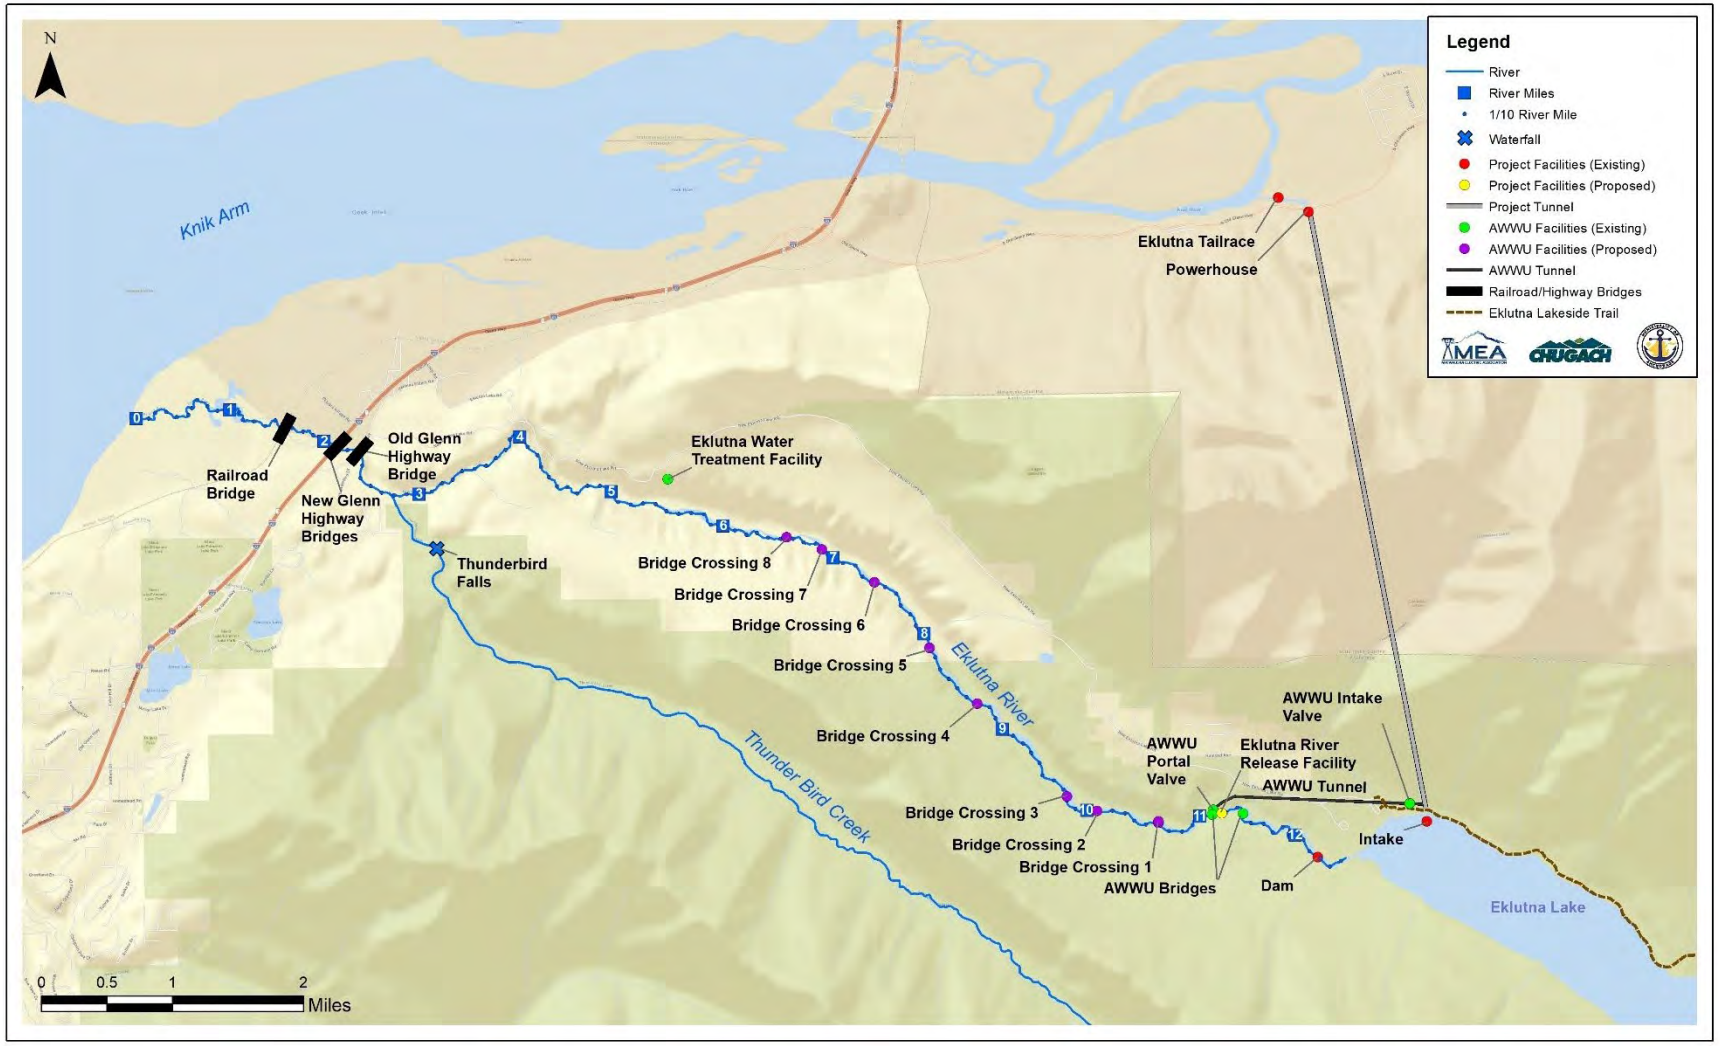

Figure 1-1. Existing and Proposed Infrastructure.

2.0 Protection, Mitigation, and Enhancement Measures

The Project Owners will continue to operate the Project in a manner consistent with the current operating procedures. In addition, The Project Owners will implement the following protection, mitigation, and enhancement (PME) measures for fish and wildlife habitat, the municipal water supply, and recreational facilities.

2.1 Year-Round Instream Flows

2.1.1 Eklutna River Release Facility

In order to provide year-round instream flows to the Eklutna River for fish and wildlife habitat, the Project Owners will construct a new valve and release structure located adjacent to the existing Anchorage Water and Wastewater Utility (AWWU) portal valve approximately one mile downstream of Eklutna Dam. The proposed infrastructure, referred to as the Eklutna River Release Facility, will consist of a tee off the existing 54-inch pipeline that conveys water from Eklutna Lake as part of AWWU's Eklutna Water Project and new control valves to bypass water into the Eklutna River. The 30% design drawings for the Eklutna River Release Facility are provided in the Supporting Information Document. The infrastructure included as part of the 30% level of design for the Eklutna River Release Facility is as follows:

- Construction of a new isolation gate structure immediately upstream of the AWWU portal valve shaft;
- Replacement of approximately 25-ft of existing pipeline with a newly fabricated steel 54-inch x 42-inch tee;
- Installation of a 54-inch gate valve on the main segment of pipe intended to provide dual means of isolation for AWWU's pipeline segment P-4;
- Installation of a 42-inch gate valve on the branch segment intended to provide isolation to the river release structure;
- Installation of a draining and filling system around each isolation valve;
- Installation of a pressure monitoring system and flow meter to provide dual redundancy to AWWU's portal release valve facility;
- Construction of a new river release structure approximately 30-ft downstream of the isolation gate structure;

- Installation of a 30-inch sleeve valve or alternative energy dissipation valve to control flow into the Eklutna River;
- Installation of a flow monitoring system to monitor flow releases into the Eklutna River;
- Construction of a bypass channel from the river release structure to the Eklutna River; and
- Upgrades to communication infrastructure to provide direct communication between the Eklutna River Release Facility, AWWU portal valve shaft, AWWU intake valve shaft, Eklutna Water Treatment Facility, and the Eklutna Power Plant.

The addition of this release facility on the existing Eklutna Water Project will not reduce or impact flow available for water supply purposes, as required by state law. Flow releases through the facility will be limited to a maximum of 80 cfs to protect the AWWU valves and pipeline. The closure rate of the proposed river release valve will be set to keep transient pressures within the rating of the lake diversion tunnel and AWWU pipeline. Additional instrumentation including new flow meters and pressure transducers will be installed to monitor the new facility and protect AWWU infrastructure in the event of an emergency.

The current design allows the AWWU pipeline to be dewatered for maintenance, and in the event of a pipeline rupture, it allows for emergency closure at the AWWU portal valve, in both cases allowing continued operation of the Eklutna River Release Facility. Any maintenance activities that may be required to replace the intake valve shaft will be planned for the fall when the lake level is high and instream flows can be released through the existing outlet gate at the dam.

The Project Owners have closely coordinated with AWWU throughout the preliminary design of the Eklutna River Release Facility and will obtain AWWU approval on all final designs related to AWWU infrastructure. The Project Owners and AWWU have also discussed the water transportation services, compensation, and water rights issues that need to be resolved in order to utilize AWWU infrastructure for providing instream flows to the Eklutna River. A summary of proposed arrangements with AWWU is set forth in the Supporting Information Document. Upon the Governor's approval, the Project Owners will enter into long-term agreements with AWWU following, and subject to, all necessary approvals. If such approvals are delayed or are not able to be obtained, the Project Owners will continue with the other PME measures outlined in this program to the degree possible.

2.1.2 Default Year-Round Instream Flow Regime

Once construction is complete, the Project Owners will utilize the existing Project intake, excess capacity in the AWWU tunnel, and new Eklutna River Release Facility to provide year-round instream flows to approximately 11 out of 12 miles of the Eklutna River. The default year-round instream flow regime, shown in Table 2-1 and Figure 2-1, varies seasonally and was developed based on field studies and modeling.

Table 2-1. Default Year-Round Instream Flow Regime.

Month	Flow (cfs)	Volume (acre-feet)
January	27	1,660
February	27	1,500
March	27	1,660
April	27	1,607
May	34	2,060
June	40	2,380
July	40	2,460
August	40	2,460
September	40	2,380
October	40	2,460
November	34	1,993
December	27	1,660
Total	-	**24,280**

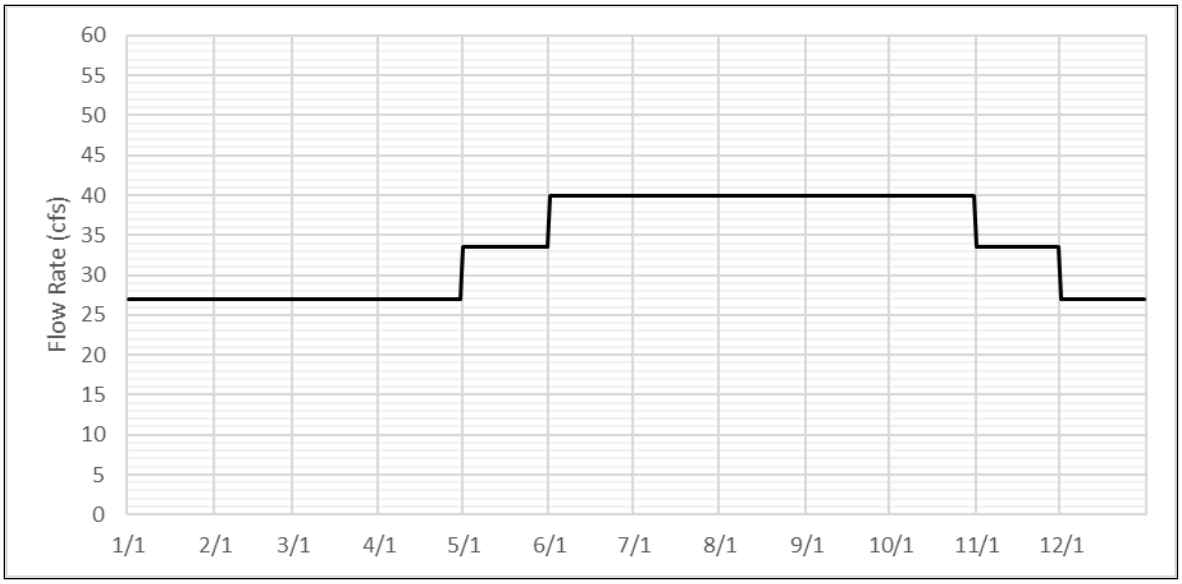

Figure 2-1. Default Year-Round Instream Flow Regime.

The default winter flow releases (27 cfs) when combined with natural accretion in the Eklutna River should promote favorable ice conditions to protect redds during incubation and provide overwintering habitat for juvenile salmon in the Eklutna River.

The default summer flow releases (40 cfs) when combined with natural accretion in the Eklutna River should (1) significantly increase the available spawning habitat for Chinook, coho, pink, and chum salmon, (2) provide sufficient flows for migrating adult salmon to navigate the potential upstream passage barriers identified in the confined canyon reach, and 3) provide additional rearing habitat for salmon.

The default November flow releases (34 cfs) reflect a downramping rate of less than 1 to 2 inches per hour to reduce the risk of any fish stranding downstream when transitioning from summer flows to winter flows.

The total volume of water to be released annually from Eklutna Lake into the Eklutna River for year-round base flows is 24,280 acre-ft/yr, equivalent to approximately 10% of the average annual inflow to the lake.

2.2 Channel Maintenance Flows

2.2.1 Existing Outlet Gate

In order to provide periodic channel maintenance flows to the Eklutna River, the Project Owners will automate the existing outlet gate within the base of the spillway at Eklutna Dam so that it can be controlled remotely. The 30% design drawings for automating the gate are

provided in the Supporting Documentation Document. The infrastructure included as part of the 30% level of design for automating the existing outlet gate is as follows:

- Replacement of existing manual actuator for the dam outlet gate with electric motor actuator with position sensing;
- Construction of new access platform and stilling well with level transducer to measure water surface elevation in Eklutna Lake; and
- Installation of 0.5 miles of new buried power line from Eklutna Lake Road to the dam.

The 30-inch by 30-inch outlet gate has a maximum capacity of approximately 190 cfs at the normal maximum water surface elevation of El 871.0 ft.

2.2.2 Channel Maintenance Flow Regime

Once year-round instream flows have been established in the Eklutna River and the existing outlet gate has been automated, the Project Owners will use both the Eklutna River Release Facility and the automated outlet gate to provide periodic channel maintenance flows to the Eklutna River. The default channel maintenance flow, shown in Table 2-2 and Figure 2-2, was developed based on field studies, modeling, and peak flow statistics in similar unmanaged Alaskan rivers and is shaped to resemble a natural peak flow hydrograph.

Table 2-2. Default Channel Maintenance Flow Releases.

Steps	Duration (hours)	Total Flow (cfs)	Base Flow (cfs)	Additional Flow (cfs)	Additional Volume (acre-feet)
1	3	150	40	110	27
2	3	200	40	160	40
3	36	220	40	180	535
4	12	200	40	160	159
5	6	160	40	120	59
6	6	140	40	100	50
7	6	110	40	70	35
8	6	90	40	50	25
9	6	80	40	40	20
10	6	70	40	30	15
11	4	60	40	20	7
Total for 1 flow	**94**	-	-	-	**971**
Total for 3 flows	**282**	-	-	-	**2,913**

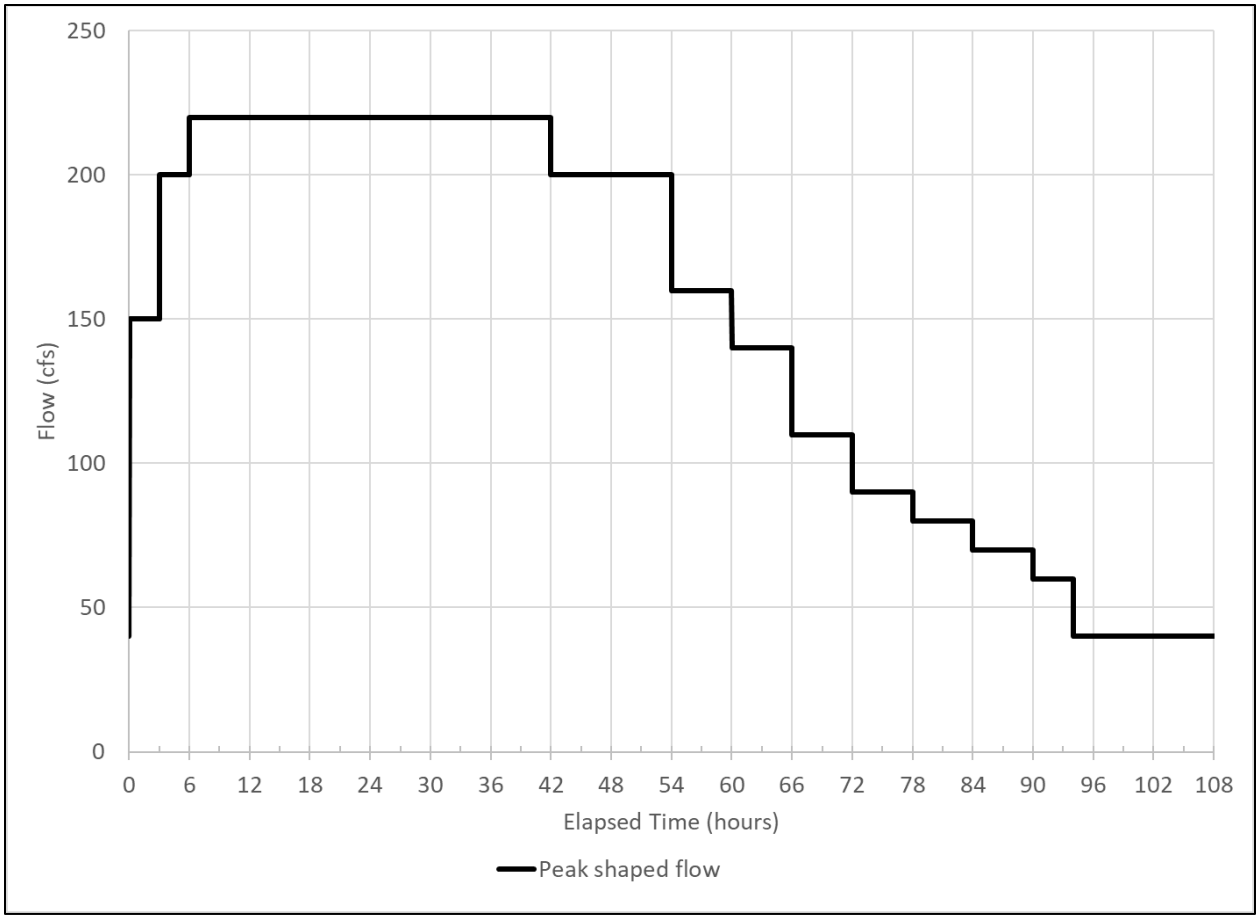

Figure 2-2. Default Channel Maintenance Flow Releases.

The default channel maintenance flow (peaking at 220 cfs for 36 hours) should complement the base flow regime and help create and maintain channel dimensions and substrate characteristics to support physical fish habitat over the long term.

The default downramping schedule (steps 4-11 in Table 2-2) reflects a downramping rate of less than 1 to 2 inches per hour to reduce the risk of any fish stranding downstream when transitioning back to base flows.

Channel maintenance flows will be conducted in the fall when the lake level is highest. The default schedule calls for the Project Owners to conduct a channel maintenance flow in years 2, 5, and 8 of each 10-year period. The first 10-year period will start with the first full calendar year after year-round instream flows are established. The total volume of water to be released in a 10-year period from Eklutna Lake into the Eklutna River for channel maintenance flows is 2,913 acre-ft. Any spill event that exceeds 220 cfs for 36 hours will count as one of the required channel maintenance flows for the current 10-year period.

The intent of providing flexibility in scheduling channel maintenance flows is to allow the Project Owners to take advantage of wet water years. If a planned channel maintenance flow coincides with a dry water year, the Project Owners may choose to postpone the channel maintenance flow to a subsequent year in the current 10-year period. However, if it is already the final year in the current 10-year period, then to the extent possible the Project Owners will curtail generation in order to raise the lake level high enough to achieve the desired flow rate. If due to unforeseen circumstances the Project Owners are unable to provide all three channel maintenance flows in any given 10-year period, then the Project Owners will provide the missed channel maintenance flows in the subsequent 10-year period.

2.3 Flow Monitoring

In order to monitor the year-round flow releases into the Eklutna River, the Project Owners will install a flow meter on the river release pipeline within the Eklutna River Release Facility. The accuracy of this meter is anticipated to utilize the ultrasonic transit time method and have an accuracy of ±1%.

In order to monitor channel maintenance flow releases into the Eklutna River, the Project Owners will utilize the rating curve for the existing outlet gate to calculate flow as a function of gate position and water surface elevation in the reservoir. The gate position will be monitored remotely via a new position feedback sensor within the electric motor operator of the gate. To monitor the water surface elevation of the reservoir, a new stilling well and pressure transducer will be located upstream of the gate within the entrance to the Eklutna Dam spillway channel. The addition of this transducer will avoid any potential inaccuracies with the existing USGS gauge measuring water surface elevation near the Project intake. The flow measurement at the gate is anticipated to have an accuracy of ±2%.

2.4 AWWU Bridges

Providing year-round instream flows to the Eklutna River will likely make all of the existing ford crossings along the AWWU access road impassable for most of the year. To mitigate these potential impacts, the Project Owners will construct eight new bridges, one at each of the existing ford crossings to allow AWWU year-round access to the AWWU pipeline for maintenance. The new bridges will be designed to pass the same flows as the two existing AWWU bridges. The existing ford crossings will be removed to prevent anyone from attempting to drive through the riverbed in the future. The 15% design drawings for the new AWWU bridges are provided in the Supporting Information Document. The Project Owners will obtain AWWU approval on all final designs related to AWWU infrastructure and will work with AWWU to obtain all necessary permits and easements as may be necessary.

2.5 Recreation

2.5.1 Lakeside Trail Repairs

The Project Owners operate the Project to not spill any water. However, due to various circumstances, spill events have occurred in the past. During past spill events, high lake levels have caused erosion along discrete segments of the lakeside trail. Chugach State Park has received $234,000 in funding for general lakeside trail repairs. Within 120 days of the Governor's approval or by January 31, 2025, whichever comes later, the Project Owners will provide a one-time payment of $234,000 to Chugach State Park (or another entity as directed by Chugach State Park) for lakeside trail repairs that address erosion impacts. This funding match brings the total budget for lakeside trail repairs to $468,000. State Parks will be responsible for seeking and obtaining approval from Eklutna, Inc. if needed. The Project Owners will not be responsible for funding the repair of any future erosion impacts to the lakeside trail that may result from continued Project operations.

2.5.2 Annual Powerhouse Maintenance

The Project Owners conduct annual maintenance activities that require Project shutdown for approximately two weeks every year. In order to avoid having multiple generation assets offline at the same time, the Project Owners coordinate with the other Railbelt utilities when scheduling the annual maintenance shutdown for the Project. In some previous years, this annual maintenance shutdown has coincided with peak fishing times and has had a negative impact on the tailrace fishery. The Project Owners will endeavor to avoid peak fishing times when scheduling the annual maintenance shutdown and any other maintenance activities that would require Project shutdown, taking into consideration the overall system maintenance needs.

2.5.3 Public Access to the Eklutna River

There is currently no free, un-permitted public access to most of the Eklutna River. The land under and surrounding the Eklutna River is largely owned by Eklutna, Inc., which requires permits for access to the Eklutna River. The Project Owners are therefore requesting that Eklutna, Inc. provide free, non-permitted public access to the Eklutna River once the ADFG Board of Fisheries has determined that the Eklutna River fishery for Chinook, coho, or sockeye salmon is sustainable and can be opened for recreational fishing.

3.0 Monitoring and Adaptive Management Plan

The PME measures described in the previous sections are based on the results of field studies, modeling, and extensive consultation. However, the Project Owners recognize there is some inherent uncertainty in modeling and physical habitat conditions in the Eklutna River will evolve over time. Therefore, the following Monitoring and Adaptive Management Plan will be implemented. This approach allows for flexibility and adjustments to PME measures, if needed.

3.1 Committee

Upon the Governor's issuance of the Final Fish and Wildlife Program, a Monitoring and Adaptive Management Committee (Committee) will be established to execute the Monitoring and Adaptive Management Plan. The Committee will consist of one voting representative from each of the following entities: ADFG, ADNR, NMFS, USFWS, and NVE. The Committee will make decisions through consensus, and the Committee chair will be selected by the members of the Committee. One or more representatives from the Project Owners will serve as non-voting participants on the Committee to provide technical expertise about Project operations. All voting and non-voting representatives named to serve on the Committee should possess the technical expertise necessary to carry out the responsibilities of the Committee and should ideally be local to the Project area. Each entity shall bear all costs for its representative to participate on the Committee.

Once the Committee is established, it will develop appropriate evaluation criteria for the Fish and Wildlife Program. These evaluation criteria will help inform monitoring efforts and adaptive management decisions. Decisions made by the Committee shall not be imputed to the Project Owners; implementation of actions pursuant to guidance provided by the Committee shall not create liability to the Project Owners.

3.2 Monitoring

The Project Owners will provide a total of $450,000 in April 2024 U.S. dollars (see Section 5.0) to ADFG over the length of the Program to fund additional monitoring efforts in the Eklutna River. The Committee will develop a plan to monitor aquatic habitat conditions and fish utilization in the Eklutna River and the straying rate of hatchery fish from the Eklutna Tailrace to the Eklutna River. The Committee may pursue other funding sources to supplement the monitoring budget if desired. ADFG will implement the monitoring plan based on direction from the Committee and must request funds from the Project Owners by July 1 each year based on the planned monitoring efforts for the subsequent year. The Project Owners will then budget accordingly and submit payment to ADFG by January 31 of the subsequent year.

Reports that summarize the various monitoring results will be prepared by ADFG and provided to the Committee by February 1 each year. The Committee will review and provide a composite report to the Project Owners by March 1 each year. The Committee shall maintain a database/archive for all monitoring results and reports.

3.3 Adaptive Management

3.3.1 Water Budget

The total volume of water available for release into the Eklutna River in the first water year (June 1 to May 31) following completion of the Eklutna River Release Facility is 24,280 acre-feet. This is based on the default year-round instream flow regime. An additional 24,280 acre-feet will become available at the beginning of each subsequent water year. An additional 2,913 acre-feet of water will become available at the beginning of each 10-year period, starting the first water year after instream flows are initiated. This is based on the default channel maintenance flow being released three times in each 10-year period.

3.3.2 Water Banking

If the entire annual water budget (24,280 acre-feet) is not released into the Eklutna River in a given water year, either intentionally or unintentionally, then that "banked water" can be released in subsequent water years with the following limitations: (1) water can only be banked for up to 5 years, (2) no more than 50% of the total annual water budget can be banked at any given time; and (3) in the event of any unplanned spill event at the Project, banked water is spilled first.

The additional water budget for each 10-year period (2,913 acre-feet) must be used within that period and cannot be carried over to the following 10-year period. However, as described in Section 2.2.2, if due to unforeseen circumstances the Project Owners are unable to provide all of the planned channel maintenance flows in any given 10-year period, then the Project Owners will provide the missed channel maintenance flows in the subsequent 10-year period.

3.3.3 Allocation of Additional Inflow

Climate change is anticipated to cause increased glacial melt in the coming decades. Increased glacial melt would likely result in more inflow to Eklutna Lake, and therefore more water available for both hydropower generation and instream flows. Because of this, the Project Owners will calculate the inflows to Eklutna Lake each year using the available lake level and flow monitoring data. Then 10 years after instream flows are established, the Project Owners will compare the average annual inflows to Eklutna Lake for the last 10 years to the previous 10-year period. Any increase in average annual inflows will be split 50/50 between

hydropower and the annual water budget for instream flows. If there is a decrease in average annual inflows, the annual water budget for instream flows will not be decreased. The Project Owners will repeat this process every 10 years.

3.3.4 Water Accounting Report

The Project Owners will prepare an annual report that summarizes (1) the inflows to Eklutna Lake, (2) instream flow releases, and (3) channel maintenance flow releases for all prior water years as well as the available water budget for the upcoming water year and provide it to the Committee by March 1 each year.

3.3.5 Requests to Modify the Flow Regime

Based on the results of the monitoring program, the Committee may request modifications to the default year-round instream flow regime and/or the magnitude, duration, frequency, or shape of the scheduled channel maintenance flow releases, as long as (1) the requested flows do not exceed the operational limitations of the Project infrastructure, and (2) the ramping rates conform to fisheries ramping rate requirements. If the total volume of water to be released exceeds the available water budget (which includes any banked water that may be available), then that deficit will be carried over into the next water year.

The Committee must provide a 60-day notice to the Project Owners for any requests to modify the default year-round instream flow regime or the default channel maintenance flow schedule. If the requested flows exceed the operational limitations of the Project infrastructure, the available water budget, or the approved ramping rates, then the Project Owners may reject the requested flow modifications. If the Project Owners reject the requested flow modifications, then they must notify the Committee so that the Committee may request alternative flows if desired. The Committee may request modifications to flows within 60 days; however, the Project Owners are not required to meet the request if it is not operationally feasible.

3.3.6 Physical Habitat Enhancement

The Project Owners will provide a total of $350,000 in April 2024 U.S. dollars (see Section 5.0) to ADFG during the Program to fund physical habitat enhancement and vegetation management efforts in the Eklutna River. The Committee will develop a plan to implement physical habitat enhancement and vegetation management efforts in the Eklutna River. These efforts will focus on enhancing rearing habitat in the Eklutna River. All physical habitat enhancement and vegetation management efforts must occur downstream of the Eklutna River Release Facility. The Committee may pursue other funding sources to supplement the physical habitat enhancement and vegetation management budget if desired. ADFG will implement the

plan based on direction from the Committee and must request funds from the Project Owners by July 1 each year based on the planned physical habitat enhancement and vegetation management efforts for the subsequent year. The Project Owners will then budget accordingly and submit payment to ADFG by January 31 of the subsequent year.

Reports that summarize the various physical habitat enhancement and vegetation management efforts will be prepared by ADFG and provided to the Committee by February 1 each year. The Committee will review and provide a composite report to the Project Owners by March 1 each year. The Committee shall maintain a database/archive for all physical habitat enhancement and vegetation management reports.

The Project Owners are not responsible for responding to natural processes that result in undesirable conditions in the river such as debris flow associated with precipitation or earthquakes, beaver activity, large wood build-up, etc.

3.4 Annual Meeting

The Committee will meet annually in April of each year to (1) review the results of the monitoring efforts conducted in the previous calendar year, (2) review the available water budget for the upcoming water year, (3) discuss any potential adaptive management actions for the upcoming water year, and (4) determine what monitoring efforts and/or physical habitat enhancement should be conducted in the subsequent calendar year. The Committee must notify the Project Owners of any planned monitoring efforts and/or physical habitat enhancement activities for the subsequent calendar year by July 1 so that the Project Owners can budget accordingly.

4.0 Limited Reopeners

Per the 1991 Agreement, the Project Owners are required to repeat this process every 35 years and must initiate the next process by October 2057. In addition, the Project Owners are required to repeat this process before making any major structural or operational modification to the Project that would substantially affect water usage or fish and wildlife. The following two limited reopeners are intended to enable consideration and potential execution of the specified structural and operational modifications during the period between processes without triggering the need to repeat this entire process outlined in the 1991 Agreement.

As set forth below, the two limited reopeners may occur no sooner than 10 years following completion of the Eklutna River Release Facility (Section 2.1.1) and establishment of year-round instream flows (Section 2.1.2). If the Eklutna River Release Facility and instream flows are delayed due to any reason such as litigation or appeals of the Final Fish and Wildlife Program or a failure to complete permitting or gain necessary approvals, the 10-year timeframe leading to the reopeners will be delayed until such time as the Eklutna River Release Facility is completed and the instream flows established.

4.1 Fixed Wheel Gate

During the consultation process, several stakeholders requested that the existing overflow spillway be replaced with a fixed wheel gate because either (1) climate change may cause inflows to the reservoir to increase significantly, which may increase the likelihood of future spill events, and a fixed wheel gate will allow the Project Owners to better manage those future spill events, or (2) while modeling results show that the default channel maintenance flow regime will maintain spawning gravels in the wetted reach of the Eklutna River, future monitoring may show that a higher magnitude channel maintenance flow that exceeds the combined hydraulic capacity of the existing outlet gate and the Eklutna River Release Facility may be warranted. Replacement of the existing overflow spillway with a new fixed wheel gate was evaluated during the study program and alternatives analysis and the Project Owners determined that it was not warranted at this time due to significant dam safety concerns, and the need for future monitoring. Recognizing that the fixed wheel gate might be warranted in the future, however, the Project Owners will continue to investigate the fixed wheel gate as described below and will construct it if certain criteria are met.

Within three years of the Governor's issuance of the Final Fish and Wildlife Program, the Project Owners will conduct a more detailed feasibility study of the fixed wheel gate (including a stability analysis and Class 3 cost estimate). The Project Owners will report the results of that analysis to the Committee.

If the fixed wheel gate is considered feasible and cost effective, then on the 10th anniversary after initiating instream flows, the Project Owners will confer with the Committee to reevaluate the need for the fixed wheel gate. If the monitoring efforts during that 10-year period indicate that (1) average annual inflows to the lake have increased by 20,000 acre-feet, or (2) the Committee determines that higher channel maintenance flows are warranted to maintain spawning gravels, then the Project Owners will commit up to $10M in April 2024 U.S. dollars (see Section 5.0) to demolish the existing overflow spillway and construct a new fixed wheel gate.

If the demolition/construction costs are estimated to be less than $10M in April 2024 U.S. dollars, then the Project Owners will obtain necessary permits, demolish the existing overflow spillway, and construct a new fixed wheel gate. If the demolition/construction costs are estimated to be greater than $10M in April 2024 U.S. dollars, then the Committee may seek supplemental funding payable to the Project Owners from other sources. If the supplemental funding is federal funding and triggers additional NEPA requirements, then the Committee will be responsible for ensuring that outside funding is available and payable to the Project Owners in order to meet those requirements. Upon receipt of such supplemental funding, the Project Owners will obtain necessary permits, demolish the existing overflow spillway, and construct a new fixed wheel gate.

This is a limited reopener and will not reopen any other components of the Fish and Wildlife Program or trigger the process requirements outlined in the 1991 Agreement. Governor approval of the decision to replace the fixed wheel gate will not be required.

4.2 Fish Passage

During the consultation process, several stakeholders requested that upstream fish passage of adult salmon into Eklutna Lake and downstream fish passage of juvenile salmon out of Eklutna Lake be evaluated. All fish passage measures proposed by the Project Owners and other stakeholders were evaluated during the study program and alternatives analysis. See alternatives analysis in Supplemental Information Document. All of the volitional upstream fish passage measures that were evaluated either (1) would have significant impacts to the hydropower project (i.e., would reduce the storage capacity of the reservoir by approximately 40% or would require the Project to be shutdown throughout the winter when energy is needed most), or (2) are cost prohibitive (the estimated present worth for the stakeholders' preferred alternatives that included volitional fish passage ranged from $221M to $385M including capex, operations and maintenance, and replacement energy). In addition, there are still significant concerns regarding the effectiveness of all the downstream fish passage facilities studied (i.e., low attraction flow velocities and/or the inability to operate the

downstream fish passage facilities while the lake is frozen over). Therefore, fish passage measures are not proposed at this time.

Nonetheless, the Project Owners recognize that fish passage may become feasible in the future and fish passage is important to NVE, the federal and state agencies, and others who have commented on the Draft Program. If a new, proven methodology or technology becomes available, then the Committee may reevaluate the potential for the construction and operation of fish passage facilities both into and out of Eklutna Lake on its own initiative or at the request of any of the resource agencies or NVE. Any fish passage measures must meet the following criteria:

1. Fish passage facilities must be safe and effective for human health, the environment, and operations of the Project, the Eklutna River Release Facility, and AWWU's Eklutna Water Project and its water supply;

2. Fish passage facilities must address both upstream and downstream fish passage for anadromous fish (i.e., no effective upstream passage without effective downstream passage);

3. Fish passage facilities cannot affect reservoir operations in a manner that would cause AWWU operation shutdown for any amount of time or Project shutdown for more than two weeks annually (except during construction);

4. Fish passage facilities cannot result in more than 10% loss of storage capacity in the reservoir (i.e., the active storage capacity in the reservoir cannot be reduced by more than 17,480 acre-feet);

5. Fish passage facilities must operate within the available water budget administered by the Committee.

Because fish passage into the lake has the potential to impact recreational use or facilities within Chugach State Park and/or the water quality of the municipal water supply, both of these potential impacts must be evaluated by the Committee. The Committee must also consult with the State Park and AWWU regarding any such impacts and the appropriate mitigation for those impacts. The Committee must ultimately obtain written consent or approval from both the State Park and AWWU for any proposed fish passage measures, including the construction schedule.

The cost of any fish passage measures (including scientific studies, engineering, construction, operation, maintenance, and mitigation for any impacts to recreational use or facilities and/or

the municipal water supply, etc.) must be completely funded by parties other than the Project Owners.

At any time more than 10 years after initiating instream flows, if (1) the Committee has identified fish passage measures that meet all of the listed criteria, (2) the Committee has obtained written consent or approval from both the State Park and AWWU, (3) the Committee has obtained the necessary funding for all fish passage measures, and (4) the Anadromous Waters Catalog maintained by ADFG has been updated to reflect that migrating or spawning adult sockeye salmon have been documented within 1 mile of the Eklutna River Release Facility, then the Committee may propose those fish passage measures to the Project Owners with supporting information. As long as all of the above criteria and prerequisites are met, then the Project Owners will support the development and operation of the proposed fish passage facilities. The Project Owners may choose to waive criteria numbers 3, 4, and/or 5 upon unanimous decision, provided that AWWU must independently consent or approve fish passage measures affecting its facilities or its water supply.

Upon receiving a statement of support from the Project Owners, the Committee and the Project Owners will coordinate and cooperate to obtain the Governor's approval of the proposed fish passage measures. Governor approval of the decision to add the fish passage facilities will be required.

If the Governor approves the proposed fish passage measures, then the 35-year timeframe requirement to repeat the consultation process required by the 1991 Agreement will restart from the date the Governor's approval.

The construction schedule must minimize impacts to Project operations. The Project Owners will oversee all construction activities and will support the development and operation of the fish passage facilities. However, the Project Owners will not operate the fish passage facilities and will be held harmless from the development and operation of such facilities.

This is a limited reopener and will not reopen any other components of the Fish and Wildlife Program.

5.0 Funding Commitments and Inflation Adjustment

All monetary amounts in this Proposed Final Program are in 2024 U.S. dollars, unless otherwise stated. All monetary amounts will be adjusted annually for inflation using a 15-year rolling average reflected in the Bureau of Labor Statistics' Urban Alaska Consumer Price Index (CPI-U) (as currently reported by State of Alaska Department of Labor and Workforce Development at https://live.laborstats.alaska.gov/cpi/table).

1.0 Introduction

The Eklutna Hydroelectric Project (Project) is located in Southcentral Alaska, approximately 30 miles northeast of downtown Anchorage near the Native Village of Eklutna (NVE). The federal government completed construction of the Project in 1955. Decades later, Chugach Electric Association (CEA), Matanuska Electric Association (MEA), and the Municipality of Anchorage (MOA) (collectively the "Project Owners") agreed to purchase the Project and entered into a Purchase Agreement with the federal government in 1989. Shortly thereafter, concerns were raised about the Project's potential impacts on fish and wildlife and a desire to avoid federal regulation. This led to the execution of a binding agreement in 1991 (referred to as the "1991 Agreement") amongst the Project Owners, National Marine Fisheries Service (NMFS), U.S. Fish and Wildlife Service (USFWS), and the State of Alaska (collectively the "Parties") that requires the Project Owners to (1) study the Project's impacts to fish and wildlife, (2) develop proposals for the protection, mitigation, and enhancement of fish and wildlife affected by the development of the Project, (3) consider the impact of fish and wildlife measures on electric rate payers, municipal water utilities, recreational users and adjacent land use, and (4) identify available means to mitigate these impacts. The Project Owners must repeat this process every 35 years and it replaces regulation by the Federal Energy Regulatory Commission (FERC). The sale of the Project was authorized by U.S. Congress in 1995, and the Project was sold to the Project Owners in October 1997.

Per the 1991 Agreement, the Project Owners were required to initiate this process no later than 25 years after the sale of the Project. Since the Project was sold in October 1997, the Project Owners were not required to initiate this process until October 2022. In order to allow meaningful consultation process and adequate time for a comprehensive analysis, the Project Owners initiated the process in March 2019, more than three years early. After several years of study and consultation with all interested stakeholders detailed in the Supporting Information Document, the Project Owners issued a Draft Fish and Wildlife Program (Draft Program) as required in the 1991 Agreement in October 2023. The Project Owners met with the Parties and NVE several times from December 2023 through March 2024 to attempt to resolve differences. They also held six public meetings in January 2024 to solicit public comments. After considering all comments received, and giving due weight to the recommendations and expertise of the Parties and NVE, the Project Owners have developed this Proposed Final Fish and Wildlife Program (Proposed Final Program) for submittal to the Governor.

Accordingly, the Project Owners are excited for the next phase of the Project. The Proposed Final Program includes the following:

- Construction of the Eklutna River Release Facility and establishment of year-round instream flows in the Eklutna River;
- Automation of the existing outlet gate at the dam to provide periodic channel maintenance flows in the Eklutna River;
- Construction of eight new bridges along the Anchorage Water and Wastewater Utility (AWWU) access road to enable AWWU's access to critical infrastructure year-round following the establishment of instream flows;
- Payment to Chugach State Park for lakeside trail repairs;
- Establishment of a Committee to oversee implementation of the Monitoring and Adaptive Management Plan;
- Funding to conduct monitoring studies in the Eklutna River throughout the 35-year program;
- Funding for physical habitat enhancement in the Eklutna River based on the monitoring results;
- Procedures for the Committee to adaptively manage the flow regime in the Eklutna River based on the monitoring results;
- Provisions for banking water in Eklutna Lake and potentially increasing the water budget for instream flows in the future;
- Potential installation of a fixed wheel gate to accommodate higher inflows in the future and/or allow higher channel maintenance flows if needed; and
- Potential installation of upstream and downstream fish passage facilities that meet specific criteria.

Approval of the Proposed Final Program will enable the Project Owners to implement these significant fish and wildlife measures at the Project, while simultaneously protecting the municipal water supply and continuing to provide low cost, renewable energy to Southcentral Alaska. The Project Owners anticipate the Governor's issuance of a Final Fish and Wildlife Program (Final Program) by October 2024.

This Supplement Information Document sets forth in a single document a description of the Project, its components and operations, the requirements of the 1991 Agreement, and a detailed summary of process and considerations leading to the Proposed Final Program. This

document also provides a guide to the large quantity of supporting information gathered and prepared by the Project Owners through the process that began in 2019. Some of that information is presented in text, tables, and figures in this Supporting Information Document or Attachments, while other information is referenced, hyperlinked, and made publicly available on the Project website (www.eklutnahydro.com). All such information is incorporated in the Proposed Final Program by reference.

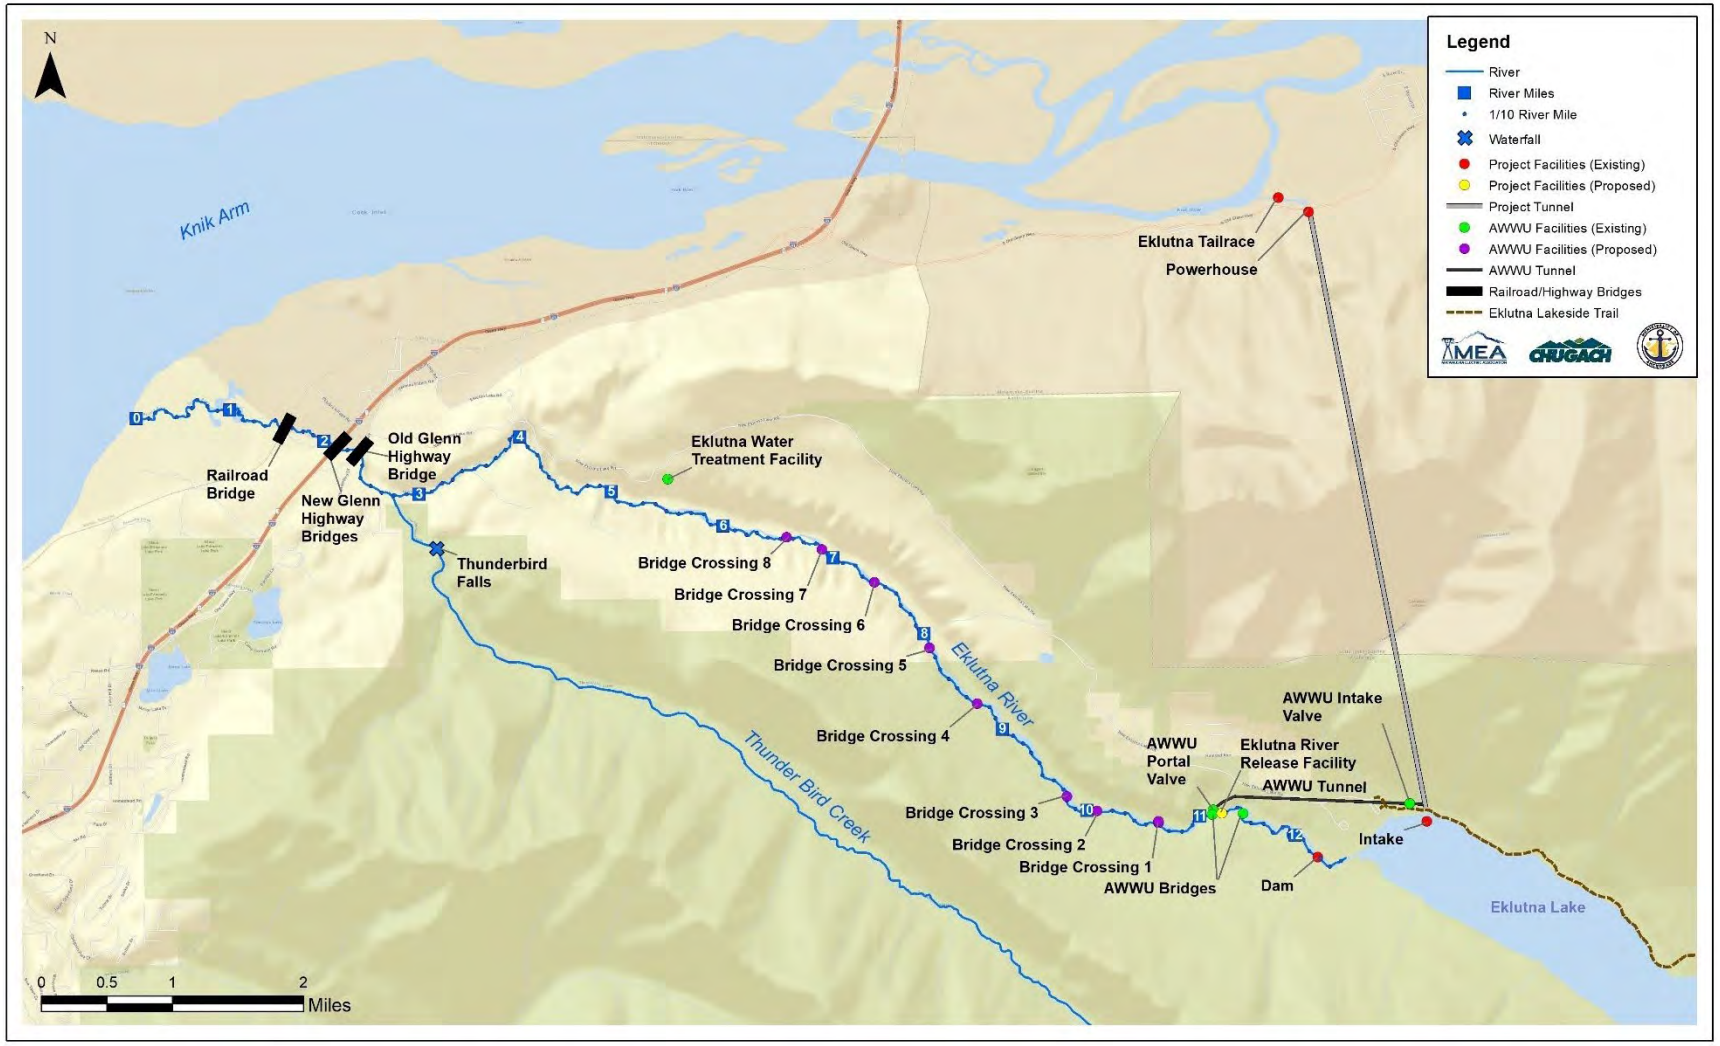

Figure 1-1. Existing and Proposed Infrastructure.

2.0 Existing Project Facilities and Operations

The 40-megawatt (MW) Project is located in Southcentral Alaska, approximately 30 miles northeast of downtown Anchorage near the Native Village of Eklutna (NVE). The U.S. Bureau of Reclamation (USBR) constructed the Project in 1955, which included rehabilitation of the old dam at the outlet of Eklutna Lake. The rehabilitated dam was damaged in the 1964 earthquake, at which point a new and taller embankment dam was constructed just downstream. This new dam (the existing dam) is an earth and rockfill structure 815 feet long and 41 feet high with a rectangular concrete spillway that runs through the dam.

Eklutna Lake (the Project reservoir) is approximately seven miles long and one mile wide and is located within Chugach State Park. The lake is the source of water for the Project. The reservoir also provides almost 90 percent of the domestic water supply for the Municipality of Anchorage to the Anchorage Water and Wastewater Utility (AWWU) through the Project intake. Typically, the reservoir fills during the summer months from snow and glacial melt and is drained during the winter months to generate power. The reservoir is generally at its lowest elevation in May and peaks in September.

The Project facilities and operation are designed to minimize release of water to the Eklutna River from the existing dam by capturing runoff during late spring/summer and taking that water out of the storage reservoir/Eklutna Lake over the course of the year and sending it through the powerhouse located on the Knik Arm. The Project water right entitles the Project Owners to operate the Project to fully utilize the water in Eklutna Lake for hydroelectric power production, except for the water that may be diverted for public water supply. The Project also provides other important benefits to electric customers including spinning reserve, frequency and voltage regulation, load following, and firming up electric generation from intermittent renewables. Additionally, the Project tailrace below the powerhouse provides a popular put-and-take Chinook and coho fishery. This fishery is public and handicap accessible.

Figure 1-1 above shows the Project location, legislative boundary for Chugach State Park, and the current extent of anadromy in the Eklutna River. The existing hydro project facilities are shown as red dots, an old hydropower project constructed in 1929 is represented by purple dots, and other non-project features such as the Eklutna Lake Campground, Eklutna Tailrace Day-Use Fishing Access Site, AWWU Water Treatment Plant, and NVE are represented by green dots. Other AWWU infrastructure shown in the figure includes the AWWU tunnel, portal valve, and buried pipeline. All three bridges in the lower river are also shown in Figure 1-1.

2.1 Existing Project Facilities

The Project consists of several components that allow water from Eklutna Lake to be diverted through a 4.5-mile-long tunnel to the powerhouse and eventually discharged into the Knik River for the purpose of power generation. The Project facilities and AWWU water supply infrastructure that is connected to Project facilities are briefly described below. More detailed information on Project facilities is provided in the IIP document available on the Project website (www.eklutnahydro.com).

2.1.1 Dam and Spillway

The existing dam is located approximately 1,400 feet downstream of the natural outlet of Eklutna Lake. It is an earth and rock fill embankment dam with a crest length of 815 feet, a crest width of 30 feet, and a crest elevation (El.) of 891 feet[1]. The crest of the dam is finished with crushed rock material to form a stable road surface (Figure 2-1). An ungated overflow spillway is incorporated within the middle of the dam. The spillway crest is El. 871 feet and the crest length is 18 feet. The dam allows for storage of water in Eklutna Lake for use throughout the year for power generation. The dam also prevents water from flowing into the Eklutna River unless the lake level exceeds the spillway crest elevation and water "spills" from the lake into the river via the spillway (see Section 2.2.3).

Figure 2-1. Dam crest and ungated overflow spillway, looking north.

There is a natural glacial moraine at the outlet of Eklutna Lake. When the lake level is below the crest of the moraine (El. 860 feet), a pond is created between the moraine and the current dam (Figure 2-2). The water level in the pond is not monitored; however, the pond level can

[1] Multiple vertical survey datums are reported in and around the main features of the Project. Throughout this document, the elevation datum that shall be used is the "local datum" tied to the crest of Eklutna Dam. Engineering documentation and design drawings, as presented in Attachment I utilizes the NAVD88, GEOID12B datum for consistency purposes throughout all of the Project Features, which is offset from the Local Datum by approximately 3.6-feet.

differ from the lake level by up to 30 feet in an average year. A small tributary entering the pond approximately 400-ft upstream of the dam keeps the water level steady in the pond when the lake is disconnected from the dam, with a small outflow leaving the pond and entering Eklutna Lake.

There is a 30-inch by 30-inch drainage outlet gate in the base of the spillway crest at El. 852 feet that was designed to drain the pond when water becomes trapped there during late fall or early winter. At the time, it was thought that this water would cause detrimental frost action against the toe of the current dam and at the spillway inlet. However, no detrimental frost action has been observed, and the gate is currently not used for this purpose. This cast iron gate was replaced in 2021 with a stainless-steel gate to allow for study flow releases that same year.

Figure 2-2. Pond between the natural glacial moraine and existing dam in May 2020.

2.1.2 Reservoir

Eklutna Lake is a natural lake formed by the retreating Eklutna glacier. It is approximately 7 miles long, one mile wide, and 200 feet deep at its deepest. The natural lake elevation is El. 850 feet.

The current dam raises the water level of Eklutna Lake by 21 feet to a maximum regulated lake level of El. 871 feet (the elevation of the spillway crest). At this elevation, the lake has a surface area of 3,420 acres. The minimum regulated lake level is El. 814 feet, which provides an active storage capacity of 174,800 acre-feet. Storage between the spillway crest (El. 871 feet) and the dam crest (El. 891 feet) is an additional 72,800 acre-feet.

2.1.3 Intake

The intake is located on the north shore of Eklutna Lake approximately one mile east of the dam. Water is diverted from the lake through an inlet channel 100 feet wide and originally about 720 feet long excavated at the lake bottom (the original intake structure and portions of the original intake conduit damaged in the 1964 earthquake remain in the intake channel). The intake channel leads to the intake structure, which consists of a rectangular reinforced concrete box structure, open and protected by trash racks on its top, front, and both sides. Elevation of the invert (i.e., the base elevation of the intake) is El. 793.6 feet.

2.1.4 Tunnel and Surge Tank

A 4.5-mile-long tunnel through Goat Mountain conveys water from the intake to the penstock. The tunnel is a circular, concrete-lined pressure tunnel with a 9-foot inside diameter. The tunnel terminates in a surge chamber located directly over the tunnel prior to entering the project penstock. The surge tank is used to dampen pressure surges within the conveyance during operation.

2.1.5 Penstock

Extending from the surge tank at the end of the tunnel is the penstock, which conveys water to the power plant turbines. The overall length of the penstock is about 1,088 feet. The penstock is a variable-diameter (91-, 83-, and 75-inch-outside-diameter) welded and coupled steel pipe encased in concrete in a tunnel extending from the surge tank to the power plant. At the powerplant, the penstock bifurcates into two 51-inch-diameter 23-foot-long branches, which are connected to the spiral cases of the turbines. A 66-inch butterfly valve is installed in each penstock branch upstream from the turbines to provide means of dewatering the turbines for servicing or maintenance. These valves also serve as emergency shutoff valves in the event of damage to the turbines.

2.1.6 Power Plant and Switchyard

The Eklutna Power Plant (Figure 2-3) is located on the Old Glenn Highway. It houses two vertical-shaft Francis-style hydroelectric generating units with an installed nameplate capacity

of 44.4 MW. The switchyard equipment, consisting of the power circuit breakers, disconnecting switches, and main buses, is on the roof of the Eklutna Power Plant.

Figure 2-3. Eklutna Power Plant.

2.1.7 Tailrace

Water discharged from the turbines in the Eklutna Power Plant enters a 209-foot-long tailrace conduit through which the water is conducted under the Old Glenn Highway to a 2,000-foot-long open tailrace channel which discharges into the Knik River (Figure 2-4). The channel has a top width of about 75 feet, a bottom width of 25 feet, and a depth of about 12 feet 6 inches.

Figure 2-4. Fisherman at the Eklutna Tailrace.

2.1.8 AWWU Connection to Project Tunnel

A water supply project was constructed in 1988 to supply water to Anchorage from Eklutna Lake (Eklutna Water Project). It is now the main source of drinking water for the Anchorage service area. The Eklutna Water Project diverts Eklutna Lake water from the Project tunnel to a diversion tunnel that connects to a buried pipeline. Water flows by gravity through the one-mile-long diversion tunnel and the approximately six-mile-long buried pipeline down the Eklutna River valley to a 750-kW energy recovery station at the Eklutna Water Treatment Plant (see Figure 1-1).

A portal valve at the intersection of the AWWU tunnel and pipeline, located approximately one mile downstream of the existing dam, is used to shut down the pipeline for emergency or maintenance purposes. The pipeline drain valve is located approximately six miles downstream of Eklutna Dam. AWWU maintains an access road that roughly parallels the pipeline and crosses the riverbed in a series of bridges and fords. After treatment, water flows by gravity through a 23-mile-long buried pipeline to the distribution system. This system supplies water to the Anchorage service area, from Eklutna Village to Potter Marsh in South Anchorage. Approximately 10% of the water diverted from Eklutna Lake provides up to 90% of the public water supply for the Municipality of Anchorage. The remaining 90% of water diverted from Eklutna Lake is used for power production.

2.1.9 Water Rights

When the Project was originally authorized in the Eklutna Project Act of 1950,[2] Congress also created a federal reserved water right in Eklutna Lake and its tributaries for the purposes of operating the Project. Under federal and state law, the Project's water right dates back to December 31, 1954, when the Project began operations.[3]

Later, after Alaska statehood, the then-federal owner of the Project, the Alaska Power Administration (APA), applied for a Certificate of Appropriation from the State of Alaska in order to comply with newly-created state law. This permanent Certificate of Appropriation (Certificate) was originally granted in 1973 and is now referred to as "ADL 44944." As subsequently amended, ADL 44944 mirrors the federal reserved water right and authorizes the Project Owners to use any and all of the natural inflow to Eklutna Lake for hydroelectric power generation subject to other terms of the Certificate.

In 1984, MOA sought to use Eklutna Lake for public water supply. Typically, under Alaska law, such a new use would be disallowed due to the senior water right of the APA, but Alaska law

[2] Public Law 81-628, 64 Stat. 383 (1950).
[3] ALASKA STAT. § 46.15.050(b) (2022).

also permits the use of Alaska waters for public water supply even where there are prior appropriators given the importance of maintaining a sufficient water supply.[4] Such use is referred to as "preferred use".[5] In acknowledgement that such preferred use can burden or harm a prior appropriator (water right holder), Alaska law requires that such use be subject to compensation in order to minimize such burden or harm.[6] Accordingly, the MOA and the then-owner (APA) entered a long-term compensation agreement entitled "Agreement for Public Water Supply and Energy Generation from Eklutna Lake, Alaska" dated February 17, 1984, that expires in 2025 (Water Supply Agreement).

Further, MOA and APA worked with Congress to amend the *Eklutna Project Act* to include the additional public water usage of the Eklutna Lake that was otherwise reserved for the purposes of the Project.[7] MOA also obtained a 40-year permit to appropriate water from the State of Alaska to utilize water from Eklutna Lake, referred to as "LAS 2569." LAS 2569 expires on December 31, 2025, and may be replaced with a certificate of appropriation subject to the continuing obligation to compensate the holder of ADL 44944 (the Project Owners).

Upon the sale of the Project to the Project Owners in October 1997, the federal reserved water right and ADL 44944 were conveyed to the Project Owners in a quitclaim deed[8] and the Water Supply Agreement was assigned to by the Project Owners.[9]

2.1.10 Land Ownership and Management

Land ownership and management in the Project area are shown below in Figure 2-5. A majority of the land adjacent to the Eklutna River was once owned by the federal government and due to a number of Alaska Native Claims Settlement Act conveyances, is now owned by Eklutna, Inc. Such ownership includes the area where the lower dam on the Eklutna River was once located, and which Eklutna, Inc. subsequently removed.

Notable exceptions to this Eklutna, Inc. area ownership today remain, however, including that: (1) the land around the AWWU portal valve is owned by BLM, and (2) the land surrounding the Eklutna Dam is owned by the State of Alaska. When the Eklutna Dam was built, this land

[4] ALASKA STAT. § 46.15.150 (2022).
[5] ALASKA STAT. § 46.15.150 (2022). "Preferred use" is further defined under Title 11 of the Alaska Administrative Code Section 93.230, which provides: "Preferred use status allows the use of water for a preferred use when adequate water is not available from the same source to supply all lawful appropriators."
[6] ALASKA ADMIN. CODE tit. 11 § 93.240 (2023).
[7] Public Law 98-552, 98 Stat. 2824 (1984).
[8] "Quitclaim Deed, Federal Reserved Water Right Under the Eklutna Project Act of 1950, 64 Stat. 382, As Amended, Including State of Alaska Water Rights Certificate of Appropriation (Amended) ADL 44944", dated October 2, 1997.
[9] Assignment and Transfer of Agreement for Public Water Supply and Energy Generation from Eklutna Lake, Alaska, as Supplemented, dated October 2, 1997.

surrounding the Eklutna Dam was still owned by the federal government, but when the Project was transferred to the Project Owners in 1997, the federal government gave the Project Owners a perpetual right-of-way to access this land for operating the Project (serial number AA-70133) so long as the Project exists.[10] When that same land was subsequently transferred by the federal government to the State of Alaska in 1998, such transfer was subject to AA-70133.[11] AWWU also has all necessary rights-of-way to access and operate its facilities adjacent to the Eklutna River, including the AWWU portal valve, access road, and buried pipeline.

A majority of the land adjacent to Eklutna Lake is also owned by Eklutna, Inc. but is managed by ADNR as part of Chugach State Park.

[10] UNITED STATES DEPARTMENT OF THE INTERIOR, BUREAU OF LAND MANAGEMENT, RIGHT-OF-WAY GRANT, Serial Number AA-70133 (September 15, 1997).
[11] United States of America Patent No. 50-2019-0080.

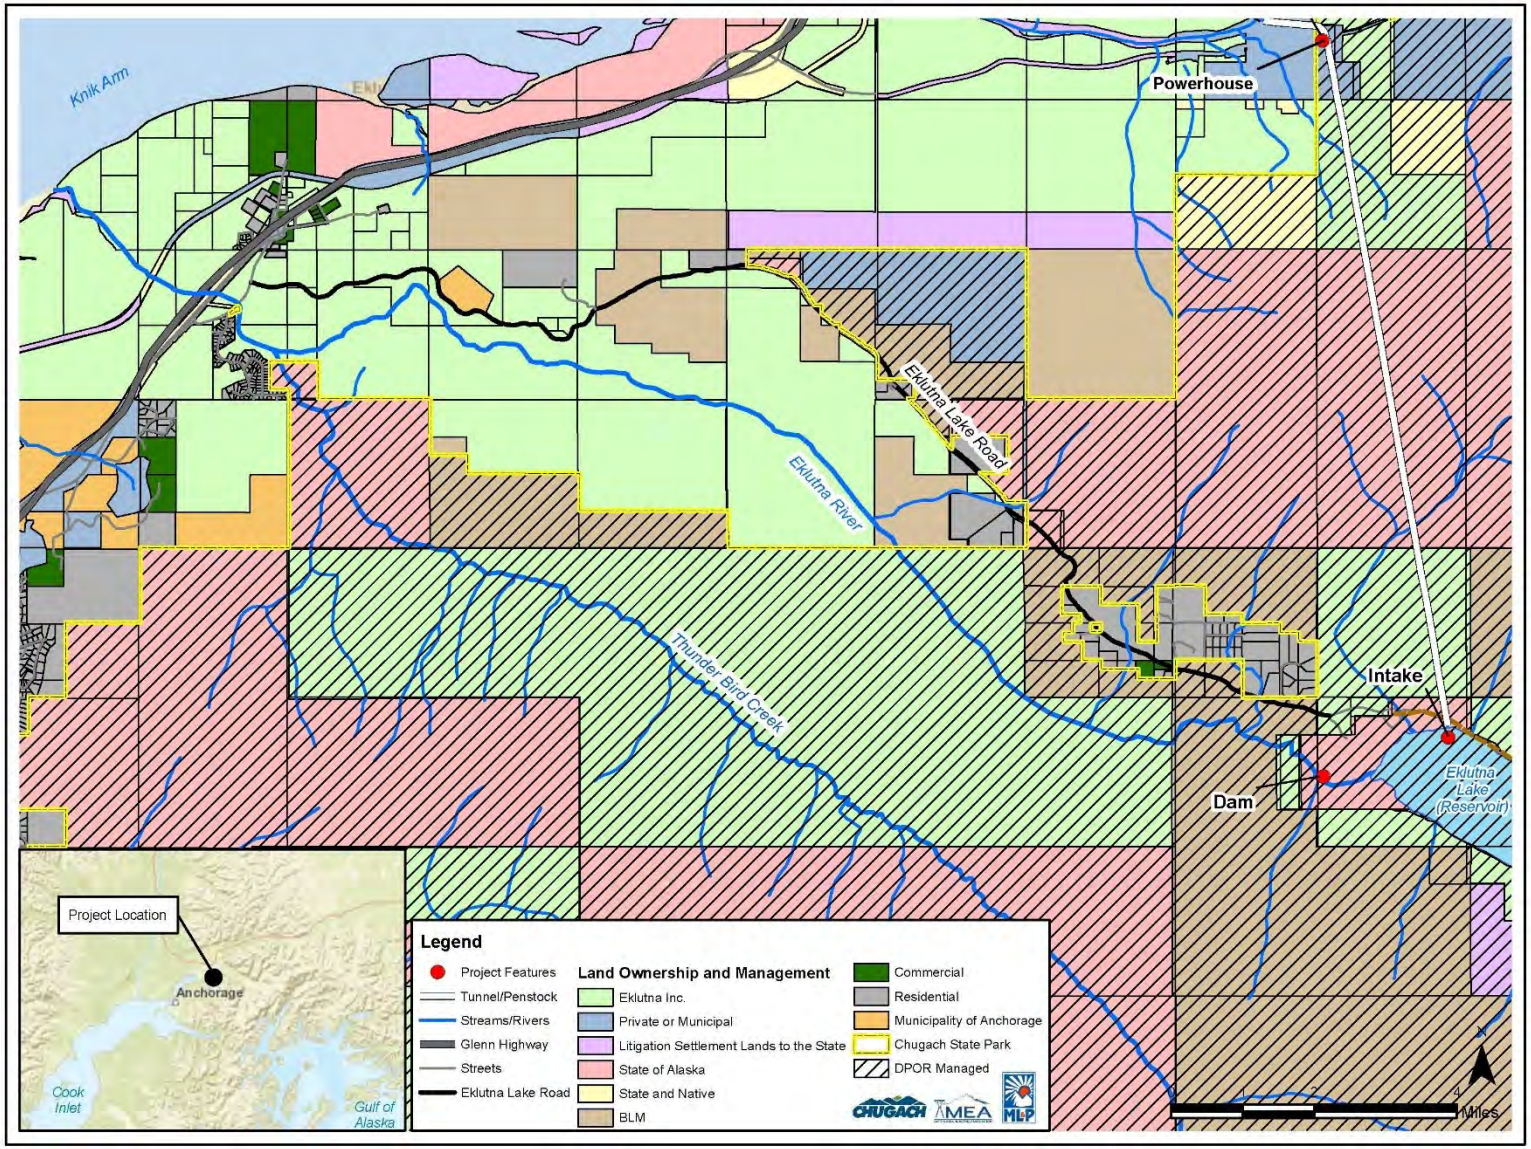

Figure 2-5. Land Ownership and Management in the Project Area.

2.2 Existing Project Operations

The Project Owners operate the Project to provide firm, low-cost, renewable energy. Project-generated renewable energy offsets approximately 72,500 metric tons of CO_2 equivalent each year and can be used to regulate other renewable energy sources like wind and solar in the future. The Eklutna Dam allows storage of spring and summer runoff for power generation in the winter when it is needed most.

2.2.1 Reservoir Operations

Typical operation of the Project is to fill the reservoir during the summer and drain it during the winter months. The Project operators try to refill the reservoir as much as possible without spilling, and the extent of winter drawdown is based on power requirements and the operator's estimates of the winter snowpack. The lake level is generally at its lowest elevation in May and then peaks in September. As shown in Figure 2-6, the lake level is drawn down below the natural lake level (El. 850 feet) for about six months out of the year, and below the crest of the natural glacial moraine (El. 860 feet) for about 9 months out of the year.

The lake level increases as a result of inflows (mostly glacial melt) and is drawn down by operation of the tunnel/penstock system. Assuming no inflow, the lake can be drawn down by approximately four inches per day when the Eklutna Power Plant is generating at max capacity (660 cfs). Water conveyance can be closed at the lake intake structure by closing the intake bulkhead gate or by closing the turbine wicket gates or the turbine inlet valves within the powerhouse.

Flow through the Eklutna Power Plant is the primary means of controlling the water level in Eklutna Lake. In addition, the 30-inch by 30-inch drainage outlet in the base of the spillway (see Section 2.1.1) is controlled by a manually operated slide gate conduit and can release up to 190 cfs (with reservoir at the spillway crest). Operation of the spillway slide gate is checked on an annual basis and the operating mechanism lubricated.

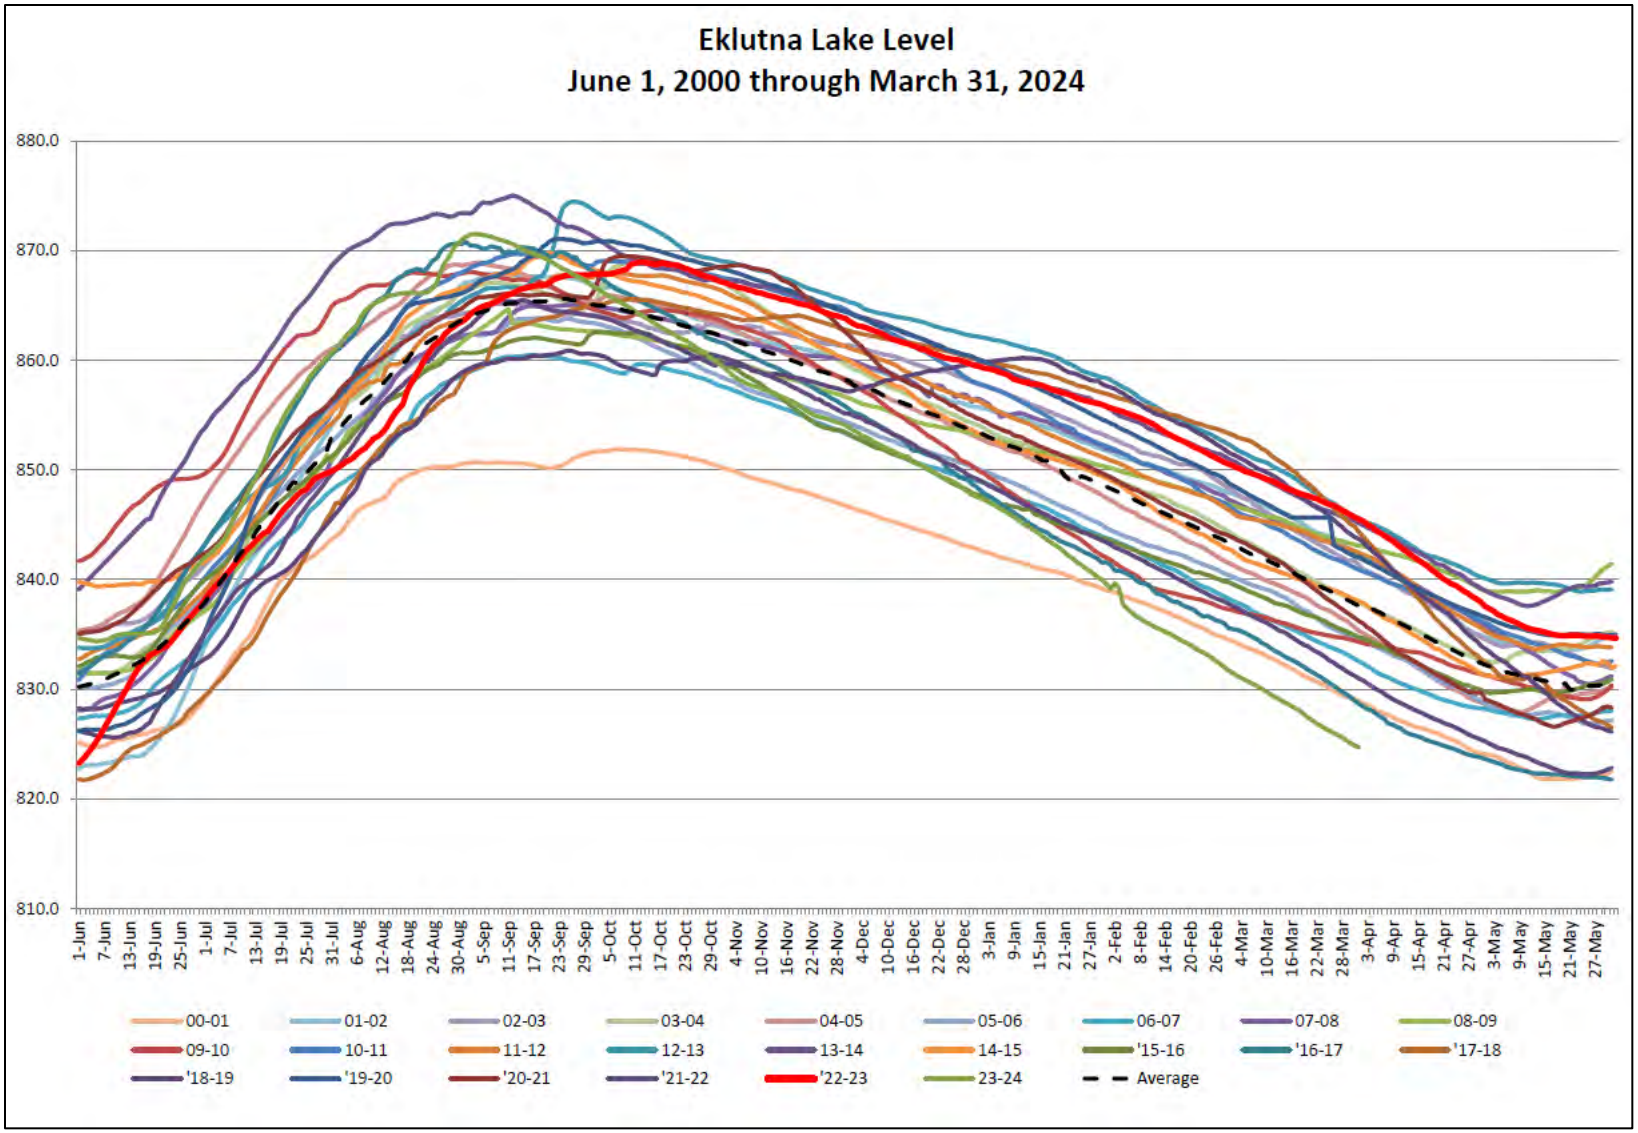

Figure 2-6. Eklutna Lake Level from June 1, 2000, through March 31, 2024.

2.2.2 Energy Generation and Cost of Power

The Project produces nearly 6% of the Project Owners' combined total generation portfolio, approximately 44% of MEA's renewable generation portfolio, and approximately 25% of CEA's renewable generation portfolio. The Project is consistently the lowest-cost resource for power in the Railbelt (i.e., the inter-connected transmission line system that runs from Fairbanks to Homer) and is necessary for MEA to meet their power capacity reserve reliability standard requirements. The average monthly energy generation output of the project is presented in Figure 2-7.

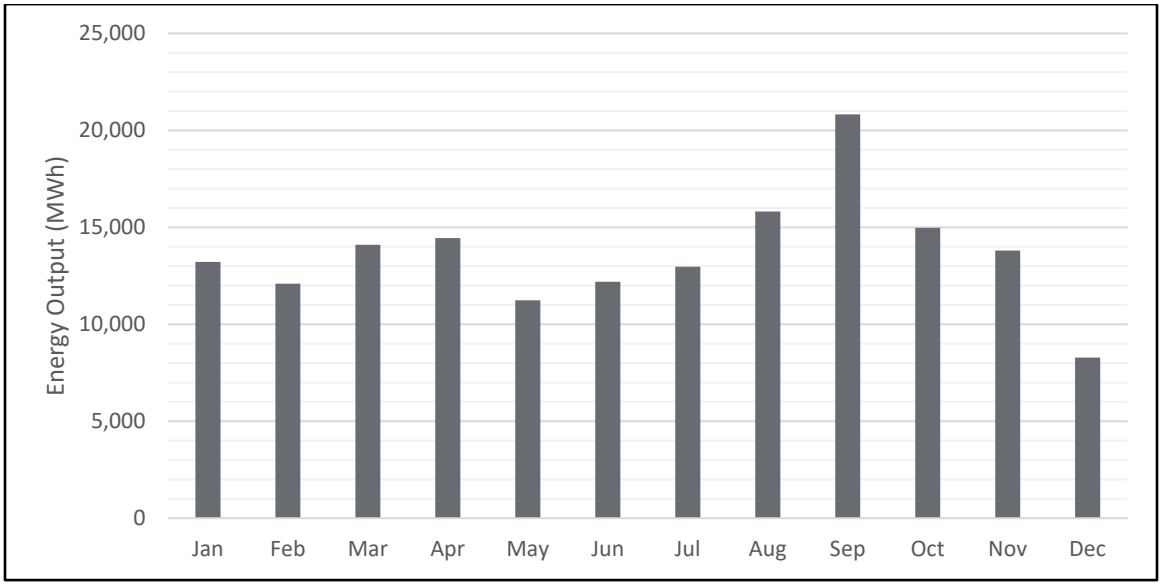

Figure 2-7. Eklutna Power Plant Average Monthly Energy Output.

One of the other major benefits of the Project is increased grid reliability through diversification of fuel for generation. With an uncertain future regarding natural gas supply and costs, hydropower plays an important alternate energy source if there is an interruption to the availability of natural gas. In addition, Project generation offsets approximately 72,500 metric tons of CO_2 equivalent each year.

The Project's value is underscored by the difficulty in locating replacement generation of similar characteristics. CEA and MEA are looking to add renewable resources to meet their respective clean energy goals, and they are grappling with considerable unknowns such as how renewable generation resources and the necessary new transmission lines for such resources can be contracted, permitted, financed, constructed, interconnected, and integrated with the existing Railbelt electric system. The cost of energy storage, integration, and regulation of intermittent generation resources adds considerable complexity and cost.

2.2.3 Spill Events

Spill occurs when water flows from Eklutna Lake into the Eklutna River via the ungated spillway (El. 871 feet). Since the spillway is ungated, the Project operators cannot control spill. Ten spill events have occurred since the existing dam was constructed in 1965. Table 2-1 summarizes the historical data and calculated values for each of these spill events.

Table 2-1. Summary of Spill Events at Eklutna Dam from 1965 to 2023.

Year	Spill Period	Duration (Days)	Peak Lake Level Elevation (ft)	Average Lake Level Elevation (ft)	Peak Spillway Flow (cfs)	Average Spillway Flow (cfs)	Total Volume Spilled (AF)
1967	9/20 – 10/11	22	872.99	-	160	-	-
1977	8/15 – 9/26	43	874.60	-	396	-	-
1981	8/15 – 9/23	40	873.50	-	226	-	-
1989	9/5 – 10/7	33	873.73	872.40	259	107	7,018
1990	9/12 – 9/27	16	872.31	871.78	85	43	1,370
1995	9/21 – 10/20	30	877.62	874.40	1,022	426	25,356
1997	8/19 – 10/31	74	875.51	873.33	561	242	35,591
2012	9/23 – 10/19	27	874.52	873.10	383	188	10,055
2013	8/9 – 10/1	54	874.99	873.18	464	201	21,567
2023	9/1 – 9/8	8	871.51	871.36	18	10	157

The highest lake level elevation ever recorded in Eklutna Lake was 877.62 feet on September 25, 1995. At this elevation, the flow through the spillway was calculated to be 1,022 cfs. The longest spill event at Eklutna Dam occurred in 1997 and lasted for a total of 74 days. The calculated total volume of water spilled during this time was 35,591 acre-feet.

3.0 Requirements of the 1991 Agreement

The 1991 Agreement is the guiding document that the Project Owners have followed during development of the Proposed Final Program and is available here on the Project website for reference. The Project Owners recognize that there is a high level of interest in the Eklutna River and are committed to meeting their obligations as outlined in the 1991 Agreement. The overarching goal of the Project Owners is to provide the information that will allow the Governor to make an informed decision with regard to the Final Program.

The main focus of the 1991 Agreement concerns protection, mitigation of damages to, and enhancement of fish and wildlife (including related spawning grounds and habitat) affected by hydroelectric development of the Eklutna Project. It specifies that the Project Owners are responsible for the consultation, study, and implementation provisions called for in the 1991 Agreement.

3.1 Procedural Requirements

The 1991 Agreement required the Project Owners to fund and conduct studies to examine and quantify, if possible, the impacts to fish and wildlife from the hydroelectric development of the Project. The studies were also designed to examine and develop proposed protection, mitigation, and enhancement (PME) measures to address those impacts. This examination also had to consider the impact of fish and wildlife measures on electric rate payers, municipal water utilities, recreational users, and adjacent land use, as well as available means to mitigate those impacts.

Per the 1991 Agreement, the study plans had to be developed by the Project Owners in consultation with the USFWS, NMFS, the Alaska Department of Fish and Game (ADFG), the Alaska Department of Environmental Conservation (ADEC), and the Alaska Department of Natural Resources (ADNR), collectively the "resource management agencies." The study plans had to include a schedule for the consultation, comment, and decision making required by the 1991 Agreement to be adopted by the Parties[12] in consultation with the Governor. Prior to implementation of the studies, the Parties had to review the study plans and concur with their scope of work. The Project Owners were required to seek input from the resource management agencies and other interested stakeholders as the studies progressed and provide the resource management agencies with an opportunity to comment on the Draft Study Reports. All comments and responses had to be included in the Final Study Reports.

[12] The Parties to the 1991 Agreement as it pertains to the Eklutna Hydroelectric Project are CEA, MEA, MOA, NMFS, USFWS, and the State of Alaska.

After the Final Study Reports were prepared, the Project Owners were required to prepare a Draft Summary of Study Results and a Draft Program. The Draft Program had to include the PME measures recommended by the Project Owners and set a tentative schedule for their implementation. The Project Owners were required to provide the resource management agencies with an opportunity to comment on the Draft Summary of Study Results and the Draft Program and/or provide recommendations. If the resource management agencies' comments or recommendations differ from those of the Project Owners, the Project Owners had to attempt to resolve such differences giving due weight to the recommendations, expertise, and statutory responsibilities of the resource management agencies.

Once comments and recommendations had been received, the Project Owners were required to hold at least one public meeting each in Anchorage and the Matanuska Valley to receive public comment on the Draft Summary of Study Results, the Draft Program, and the comments and recommendations of the resource management agencies. The Project Owners were required to prepare a summary and analysis of all comments received, develop a Proposed Final Program, and prepare an explanatory statement describing the basis for the Proposed Final Program. All of this information must be provided to the Parties and the Governor.

The Parties then have 60 days to submit written comments on the Proposed Final Program, and any alternative recommendations for the protection, mitigation, and enhancement of fish and wildlife resources, to the Governor. The Project Owners then have 30 days to submit written reply comments to the Governor. The Governor is required to review the Proposed Final Program as well as any comments or recommendations for alternative PME measures while giving equal consideration to:

1. Efficient and economical power production
2. Energy conservation
3. The protection, mitigation of damages to, and enhancement of fish and wildlife (including related spawning grounds and habitat)
4. The protection of recreational opportunities
5. Municipal water supplies
6. The protection of other aspects of environmental quality
7. Other beneficial public uses
8. Requirements of State law

Based on his review and consideration, the Governor is required to establish a Final Program that adequately and equitably protects, mitigates damage to, and enhances fish and wildlife resources (including affected spawning grounds and habitat) affected by the Project. The Project Owners are required to implement the Final Program established by the Governor. Pursuant to the 1991 Agreement and APA Asset Sale Act, the Governor's decision regarding the provisions of the Final Program is reviewable and enforceable by the Parties in the U.S District Court for the District of Alaska.

3.2 Schedule Requirements

The 1991 Agreement gives deadlines for specific milestones in the consultation, program development, and implementation processes. These deadlines, listed below, are all relative to the date on which ownership of the Project was officially transferred from the Federal government to the current Project Owners (October 2, 1997). This date is referred to as the Transaction Date.

- Initiate the consultation process no later than 25 years after the Transaction Date (October 2, 2022)
- Issuance of the Final Program by the Governor at least 3 years prior to implementation (October 2, 2024)
- Begin implementation of the Final Program no later than 30 years after the Transaction Date (October 2, 2027)
- Complete implementation of the Final Program no later than 35 years after the Transaction Date (October 2, 2032)

The Project Owners are required to repeat the process called for in the 1991 Agreement on a recurring basis every 35 years, beginning within 25 years of the time implementation of the Final Program has been completed for the prior consultation process. In addition, the Project Owners are required to repeat the process called for in the 1991 Agreement prior to undertaking any major structural or operational modifications substantially affecting water usage or fish and wildlife at the Project.

4.0 Compliance with the 1991 Agreement

The Project Owners have fully met the procedural and schedule requirements of the 1991 Agreement to date. In fact, the Project Owners have gone well beyond the requirements of the 1991 Agreement in terms of consultation, documentation, and analysis of alternatives. In terms of schedule requirements, the Project Owners began the process more than three years prior to the prescribed initiation date. The following sections describe the efforts undertaken by the Project Owners to date to comply with the 1991 Agreement and highlight the efforts that have gone beyond the requirements.

4.1 Early Consultation

The 1991 Agreement states that the Project Owners shall consult with the USFWS, NMFS, ADF&G, ADEC, and ADNR regarding the development of study plans and that "the consultation process shall be initiated no later than 25 years after the Transaction Date," (i.e., October 2, 2022).

The Project Owners began the consultation process in 2019, three years earlier than required by the 1991 Agreement. Recognizing the high level of public and tribal interest in the Project, the Project Owners did not limit consultation to the five federal and state agencies identified in the 1991 Agreement, but they reached out to many other entities with an interest in the Project. Their consultation efforts included in-person meetings, quarterly calls and newsletters, technical work groups, and involvement of interested stakeholders in the alternatives analysis process. A summary of consultation undertaken by the Project Owners is included in Attachment A; early consultation efforts are highlighted below.

4.1.1 Initial Consultation Meetings

In March and April of 2019, more than three years earlier than required by the 1991 Agreement, the Project Owners conducted in-person initial consultation meetings with multiple agencies and interested stakeholders. In total, the Project Owners met with 14 agencies and interested stakeholders as part of their initial consultation efforts, including:

- National Marine Fisheries Service (NMFS)
- U.S. Fish and Wildlife Service (USFWS)
- Alaska Department of Fish and Game (ADFG)
- Alaska Department of Environmental Conservation (ADEC)

- Alaska Department of Natural Resources (ADNR), including:
    - Division of Mining, Land, and Water
    - Division of Parks and Outdoor Recreation (State Parks)
    - Office of History and Archaeology (OHA)
- Alaska Department of Transportation & Public Facilities (ADOT&PF)
- Alaska Railroad Corporation (ARRC)
- Anchorage Water and Wastewater Utility (AWWU)
- U.S. Army Corps of Engineers (USACE)
- Eklutna, Inc.
- Native Village of Eklutna (NVE)
- The Conservation Fund (TCF)

After these initial consultation meetings, the Project Owners identified additional interested stakeholders and consulted with them as appropriate, including Cook Inlet Region, Inc. (CIRI), Cook Inlet Aquaculture Association (CIAA), The Alaska Center, Trout Unlimited (TU), the Alaska Energy Authority (AEA), the Alaska Institute for Climate and Energy (ALICE), staff from Alaska Pacific University (APU), the Anchorage Watershed and Natural Resources Advisory Commission (WNRC), and the U.S. Bureau of Land Management (BLM).

Some entities, while interested in the Project, declined to participate in the consultation process, including the U.S. Environmental Protection Agency (EPA), U.S. Geological Survey (USGS), National Weather Service (NWS), and the Anchorage Waterways Council.

4.1.2 Group Stakeholder Meeting

During the initial consultation meetings, several entities requested a follow-up group meeting to promote technical discussion amongst the agencies and interested stakeholders. In response to those requests, the Project Owners conducted an in-person follow-up group meeting on July 16, 2019. Discussion topics included a review of the contact list and existing information gathered to date, updates on on-going data collection by others, an overview of current Project operations, discussion regarding the initial comments and concerns of agencies and interested stakeholders, and next steps.

4.1.3 Project Website

In 2019 the Project Owners developed and launched a Project website, www.eklutnahydro.com. The purpose of this website is to provide information on the efforts being undertaken by the Project Owners to comply with the 1991 Agreement, including background information, the Project schedule, Project updates, reference and final documents, frequently asked questions, and a contact form.

4.1.4 Quarterly Update Calls

During the July 2019 Group Stakeholder Meeting, it was suggested that the Project Owners conduct quarterly calls to update the agencies and interested stakeholders on Project activities. The Project Owners conducted the first quarterly update call in November 2019, and since that time, have continued to conduct these calls approximately every three months.

4.1.5 Anchorage Assembly

In February 2020, the Project Owners were invited to give a brief presentation to the Anchorage Assembly at a work session regarding the Eklutna River. The Project Owners have continued to provide subsequent updates to the Anchorage Assembly's Enterprise and Utility Oversight Committee on a quarterly basis. All of the presentations that have been given to the Anchorage Assembly are available here on the Project website.

4.1.6 Native Village of Eklutna

Eklutna Village is located near the mouth of the Eklutna River. The historical and current presence of the Eklutna Dena'ina in the area is described in the IIP. The Project Owners first met with NVE as part of their initial consultation efforts (Section 4.1.1) and have continued to engage with NVE throughout this process.

In April 2020, NVE requested formal recognition as a consulting government, with their Land and Environment Department analogous to other governmental signatories, for purpose and processes of the 1991 Agreement applicable to the Project. In a May 2020 letter to the Project Owners, NVE recognized that amending the 1991 Agreement may entail substantial time and effort, and as an alternative invited a joint letter from the Project Owners to the effect that the Project Owners will act in good faith to help mitigate impacts to the Eklutna River and that the Project Owners will recognize NVE as a consulting government on a basis comparable to the governmental signatories to the 1991 Agreement.

In June 2020, the Project Owners responded to NVE's request by committing to a review and participation framework that ensures information NVE and its members share regarding the

Eklutna River and development of the Fish and Wildlife Program is appropriately considered and addressed. This includes:

- Providing significance and due weight to NVE's expertise throughout the development of the Fish and Wildlife Program
- Recognizing and including traditional ecological knowledge (TEK) in the review and development of the study plans and Fish and Wildlife Program
- Working with NVE to schedule additional meetings with the goal of hearing input from NVE and its members (one after the study program is completed and another following the development of the Draft Program) and coordinating with NVE on developing the agenda items for these meetings
- Recommitting to sharing all study plans, data, reports, and comments directly with NVE when developed to seek feedback
- Submitting an NVE-specific comment summary to the Governor for consideration along with the Project Owners' Proposed Final Program (see Section 4.12)

The Project Owners' letter also stated: "We value the unique perspectives of NVE's members regarding the Eklutna River, and we also understand that NVE is primarily interested in the presence of both water and salmon in the lower Eklutna River. While we are contractually and legally bound by the terms of the Agreement, please know that if the process set forth in the Agreement bears out the release of water from Eklutna Lake and the addition of salmon into the Eklutna River as part of the Fish and Wildlife Program, we will be prepared to support it."

Since then, NVE has been involved in all four Technical Work Groups (TWGs) (see Section 4.3), the alternatives analysis (see Section 4.5), and attempts to resolve differences (see Section 4.8). The Project Owners have also met with the NVE Tribal Council on several occasions, including meetings with the Boards of Directors for both CEA and MEA and the Anchorage Assembly.

4.1.7 Project Newsletter

In December 2020, the Project Owners published their first Project newsletter. These newsletters provided a status update regarding the Project Owners' efforts to comply with the 1991 Agreement and next steps. They have been issued quarterly and are all available here on the Project website.

4.2 Initial Information Package

Although not required by the 1991 Agreement, the Project Owners developed an Initial Information Package (IIP) document. The IIP established a baseline of existing information and informed the study planning process required by the 1991 Agreement. The Draft IIP was distributed to stakeholders in March 2020 for review and comment. The Project Owners received comments from NMFS, ADNR, ADOT&PF, NVE, TCF, TU, ALICE, and two members of the public. The Project Owners revised the document based on comments received and issued the Final IIP in September 2020. The Draft and Final IIP and all comments received are available here on the Project website. All reference documents used to develop the IIP are available here.

4.3 Technical Working Groups

In April 2020, a Technical Working Group (TWG) focused on aquatic resources was established to solicit technical input throughout study planning, implementation, and reporting. In October 2021, three more TWGs were established to address other resource areas, including the Terrestrial TWG, Cultural TWG, and Recreation TWG. Table 4-1 shows the entities that participated in each of the TWGs.

Table 4-1. Technical Working Group Members.

Entity	Aquatics	Terrestrial	Recreation	Cultural
Native Village of Eklutna	x	x	x	x
Alaska Department of Fish and Game	x	x	x	
ADNR Chugach State Park			x	
ADNR Office of History and Archaeology				x
U.S. Fish and Wildlife Service	x	x		x
National Marine Fisheries Service	x			
Trout Unlimited	x		x	
Alaska Pacific University	x	x		
Project Owners	x	x	x	x

The TWGs met regularly to assist in study planning and review technical information developed by the study program and by others. A total of 28 TWG meetings were held during the study program (see Attachment A).

4.4 Study Program

The 1991 Agreement required the Project Owners to fund studies to examine and quantify, if possible, the impacts to fish and wildlife from the Project. Per the 1991 Agreement, the studies had to examine and develop proposed PME measures to address those impacts. This examination had to also consider the impact of potential fish and wildlife measures on electric rate payers, municipal water utilities, recreational users, and adjacent land use, as well as available means to mitigate these impacts.

Beginning in 2020, the Project Owners consulted with the TWGs regarding the development of a comprehensive, 2-year study program implemented in 2021 and 2022. During that same time period, several other entities were also conducting studies in the Eklutna watershed. These studies included:

- Aquatic habitat monitoring conducted by ADFG, originally under an agreement with Eklutna Inc., then under a new agreement with TU. These study results were shared with the Project Owners.
- Sediment transport monitoring at the highway and railroad bridges conducted by Eklutna, Inc. These study results were shared with the Project Owners.
- Adult salmon spawner surveys conducted by NVE. The data collected in 2021-2022 were shared with the Project Owners.
- Minnow trapping in the lower Eklutna River conducted by NVE. The data collected in 2021-2022 were shared with the Project Owners.
- Habitat assessment of the East and West Forks of Eklutna Creek conducted by NVE. This study has not been completed yet.
- Stream gaging in the East and West Forks of Eklutna Creek conducted by APU. The data from this ongoing effort is publicly available.
- State-wide pumped hydro study conducted by AEA. This study has not been made publicly available.
- Pumped hydro system flow analysis and animation conducted by ALICE in coordination with NVE. This analysis has not been completed yet.
- Formal TEK assessment of the historic and cultural importance of the Eklutna River conducted by NVE in partnership with TU. This assessment has not been completed yet.

The Project Owners coordinated with each of these entities during study planning regarding relevant study methods, monitoring locations, etc. When available, the Project Owners incorporated the results of these other studies in their study reports. Of note, NVE shared their fish survey and habitat study data with the Project Owners, which were included in the Fish Species Composition and Distribution Study Report and the Eklutna Lake Aquatic Habitat and Fish Utilization Study Report (see Section 4.4.2).

4.4.1 Early Study Efforts

In May 2020 the Project Owners acquired LiDAR, aerial imagery, and spherical video of the entire Eklutna River as well as the northeastern shoreline of Eklutna Lake along the lakeside trail. The spherical video is available at https://biglook360.com/eklutna/.

In July 2020, the Project Owners conducted a site reconnaissance with ADFG staff to support study planning efforts. The Aquatics TWG met on July 23, 2020, to review the observations made during the site reconnaissance and to kick-off the study planning process. This meeting included initial discussions regarding the planned Instream Flow Study (see Section 4.4.2), potential study methods, and associated challenges with providing study flow releases.

In August 2020, the Project Owners conducted an initial condition assessment of the drainage outlet gate at the base of the spillway to determine if it could be used to provide study flow releases into the Eklutna River for the planned Instream Flow Study. In the same month, the Project Owners also established several monitoring transects and installed scour monitors in the Eklutna River in advance of any potential unplanned spill events to allow for subsequent data collection that could benefit the study program. There were no spill events in 2020; however, the established transects and scour monitors were later utilized during the Geomorphology and Sediment Transport Study (see Section 4.4.2) to assess erosion and sediment transport through the Eklutna River downstream from Eklutna Lake and to help calibrate the sediment transport model.

The final Eklutna River LiDAR and aerial imagery report, spillway and drainage outlet inspection report, geomorphology monitoring plan and transect locations are all available here on the Project website.

4.4.2 Year 1 Study Planning

Based on this early work, the Project Owners developed a Proposed Study Program Framework and presented it to Aquatics TWG on September 3, 2020. This meeting included discussion regarding how study efforts would occur over a two-year period, the goals and objectives, general study area, proposed methods for each study, the study plan outline, and the study planning schedule.

Draft Study Plans were distributed to the Aquatics TWG on October 26, 2020, for review and comment. The deadline for written comments was November 25, 2020. The Project Owners received comments from NVE, ADFG, USFWS, NMFS, TU, APU staff, and a member of the WNRC. Two meetings were held with the Aquatics TWG on November 30, 2020, and December 21, 2020, to review and address the Aquatics TWG's comments on the Draft Study Plans.

The Project Owners revised the Draft Study Plans based on the comments received, and the Revised Draft Study Plans were distributed to the Aquatics TWG on January 18, 2021, for review and comment. The deadline for written comments on the Revised Draft Study Plans was January 29, 2021.

Since several of the Aquatics TWG's comments on the Draft Study Plans were questions related to the operational capabilities of the Project, the Project Owners decided to start developing the proposed hydro operations model early and presented the preliminary modeling results to the Aquatics TWG at a meeting on January 26, 2021, to help inform the Aquatics TWG's comments on the Revised Draft Study Plans. The Project Owners also addressed additional clarifying questions from the Aquatics TWG at the January 2021 meeting in advance of the comment deadline.

The Project Owners received comments from ADFG, NMFS, TU, and APU staff and revised the study plans again based on comments received. As required by the 1991 Agreement, the Proposed Final Study Plans were distributed to the Parties on February 24, 2021, for review and concurrence on the scope of work.

A meeting amongst the State agencies involved in the Project was held on February 25, 2021, to determine how the State of Alaska, as a party to the 1991 Agreement, would concur on the scope of work in the study plans. The State agencies determined that it would be most appropriate for the Commissioners of each State agency (ADFG, ADEC, ADNR, and ADOT&PF) to sign a letter stating that they concur on the scope of work in the study plans, and then the Project Owners would send those concurrence letters to AEA, the Governor's representative, with the Proposed Final Study Plans for review and feedback.

The Project Owners received concurrence letters from all of the state and federal agencies, including the NMFS, USFWS, ADFG, ADEC, ADNR, and ADOT&PF. The State agency concurrence letters and the Proposed Final Study Plans were sent to AEA as the Governor's representative for review and feedback; however, the Project Owners did not receive any additional feedback from AEA. Each version of the Year 1 Study Plans, all comments received, and each of the concurrence letters are available here on the Project website.

Studies initiated in 2021 included the following:

- **Instream Flow Study** – informed how much habitat would be created by a range of potential flows for various species (Chinook, coho, sockeye) and life stages (spawning and rearing).
- **Geomorphology and Sediment Transport Study** – informed what peak flows might be needed in conjunction with year-round instream flows.
- **Fish Species Composition and Distribution Study** – identified what fish species were present in the Eklutna River, what habitat they were utilizing, and when.
- **Water Quality Study** – monitored various water quality parameters (temperature, dissolved oxygen, pH, turbidity, nutrients, etc.) in both the Eklutna River and Eklutna Lake.
- **Macroinvertebrate Study** – assessed the baseline community of aquatic organisms at three locations in the Eklutna River.
- **Stream Gaging** – collected continuous flow data at various points in the Eklutna River and select tributaries to Eklutna Lake.
- **Lake Aquatic Habitat and Fish Utilization Study** – examined the presence and health of fish in Eklutna Lake, as well as the availability of potential spawning habitat around the lake shoreline and in its tributaries.
- **Lakeside Trail Erosion Study** – identified areas along the Eklutna Lakeside Trail that were experiencing shoreline erosion and the potential causes.
- **Hydro Operations Model Development** – allows the assessment of different potential operational scenarios for the hydroelectric project.
- **Existing Infrastructure Assessment** – evaluated the condition and hydraulic capacity of downstream infrastructure, including the AWWU infrastructure, railroad bridge, and highway bridges.

One of the major components of the year 1 study program was the need to conduct study flow releases for both the Instream Flow Study and the Geomorphology and Sediment Transport Study. With the current infrastructure, the drainage outlet gate at the base of spillway in the dam is the only mechanism for providing controlled flow releases from the lake into the river. However, this gate had not been used regularly, and upon inspection, it was determined that the gate needed to be replaced. The Project Owners were able to design, procure, permit, and

install the new drainage outlet gate during the summer of 2021 before the planned study flow releases in the fall of 2021, which ranged from 150 cfs to 25 cfs over 3 weeks.

It should be noted that in 2018, a different dam (non-operational since 1955) was removed from the lower stretch of the Eklutna River by Eklutna, Inc. After the removal of this lower dam, a significant portion of the sediment wedge that had accumulated behind the lower dam for decades was left in the river. During year 1 study planning, some TWG members requested a flushing flow as part of the study program to flush the remaining sediment from behind the lower dam site. It was determined that this flushing flow was not necessary for study purposes. However, the Project Owners did commit to evaluating the need for conducting a higher calibration flow as part of the second study year.

In June 2021, before the study flow releases, the Project Owners organized a site visit with the Aquatics TWG (Figure 4-1) to identify and establish transect locations. A total of 30 transects were established throughout the river for the Instream Flow Study in relatively stable areas of the river that were not likely to change significantly as a result of the study flow releases. Additional transects were established throughout the river for the Geomorphology and Sediment Transport Study in relatively dynamic areas of the river that were more likely to change significantly as a result of the study flow releases.

Figure 4-1. Site Visit with the Aquatics TWG in June 2021.

In preparation for study flow releases, the Project Owners requested consent and waiver of liability from the principal landowners downstream of the dam for any damage that may result from the potential movement of Eklutna Inc.'s sediment wedge during the planned study flow

releases. The principal downstream landowners include Eklutna, Inc., ADOT&PF, ARRC, and the MOA/AWWU. Among them, only the MOA/AWWU consented and waived such potential liability.

4.4.3 Year 1 Study Reporting

The Project Owners held a series of TWG meetings in November 2021 to discuss the preliminary results of the year 1 studies. Draft year 1 study reports were distributed to the TWGs and other interested parties (including AWWU) in February 2022 for review and comment. The Project Owners received comments on the draft study reports from ADFG, NMFS, and AWWU. The study reports were then revised and finalized based on comments received. The year 1 study reports and all comments received are available here on the Project website.

4.4.4 Year 2 Study Planning

Based on observations made after the study flow releases and the preliminary results from the first year of studies, the Project Owners revised the Study Program Framework for year 2 and presented it to the TWGs during the November 2021 TWG meetings. As stated above, these meetings included discussions regarding preliminary results from year 1 (if applicable), what studies were being proposed for year 2 (Table 4-2), and the goals, general study area, and proposed methods for each study.

Table 4-2. Year 2 Study Program.

Studies Continued from Year 1 (2021)	Studies Initiated in Year 2 (2022)
Instream Flow Study	Engineering Feasibility and Cost Assessment
Geomorphology and Sediment Transport Study	Hydropower Valuation Study
Fish Species Composition and Distribution Study	Wetland and Wildlife Habitat Study
Lake Aquatic Habitat and Fish Utilization Study	Terrestrial Wildlife Study
Water Quality Study	Recreation Study
Stream Gaging	Cultural Resources Study
	LiDAR and Ortho Imagery Acquisition

Following their commitment in 2021, the Project Owners evaluated the need for a higher calibration flow in 2022. However, based on the data collected in 2021, it was determined that reasonably reliable models could be developed using the collected data, and that a higher calibration flow in 2022 was not necessary for study purposes.

The Draft Year 2 Study Plans were distributed to the Parties and TWGs on February 11, 2022, for review and comment. The deadline for written comments on the Draft Year 2 Study Plans was March 11, 2022. The Project Owners received comments from NVE, USFWS, NMFS, ADFG, ADEC, OHA, TU, and TCF.

A series of TWG meetings were held in March 2022 to address substantive comments on the Draft Year 2 Study Plans that required further discussion. The Project Owners then revised the study plans based on comments received and distributed the Proposed Final Year 2 Study Plans to the Parties on April 1, 2022, for review and concurrence.

The Project Owners received concurrence letters from each of the state agencies. The NMFS and USFWS also provided concurrence letters but only concurred with 10 of the 12 study plans. The federal agencies did not concur with the Geomorphology and Sediment Transport Study Plan or the Instream Flow Study Plan due to their uncertainty about the Project Owners ability to model higher flows without a significantly higher calibration flow.[13] The Project Owners documented this area of non-agreement and distributed the Proposed Final Year 2 Study Plans and State concurrence letters to AEA as the Governor's representative for review and feedback; however, the Project Owners did not receive any additional feedback from AEA. Each version of the Year 2 Study Plans, all comments received, and each of the concurrence letters are available here on the Project website.

It should be noted that although it was not included in the Year 2 Study Plans, the Project Owners also conducted a winter flow analysis to determine the range of flows that would be needed to promote favorable ice conditions. These study results were presented to the Aquatics TWG in March 2023 (see Section 4.4.6).

4.4.5 Year 2 Interim Reporting

The Project Owners held a series of meetings with the Aquatics TWG in September, October, and November 2022 to present the preliminary year 2 study results and potential engineering solutions (PME measures) for providing year-round instream flows, periodic peak flows, and fish passage both into and out of the lake. During those meetings, the Aquatics TWG determined which potential engineering solutions should be advanced to phase 1 engineering, which involved the development of 5% conceptual designs and Class 5 Opinion of Probable Construction Costs (OPCC) for each PME measure. The preliminary study results, potential PME measures, and all comments received are available here on the Project website.

[13] The Project Owners acknowledge the uncertainty associated with any modeling effort. And after reviewing the modeling results, both federal agencies have confirmed the validity of both models.

The proposed PME measures and those that were advanced to phase 1 engineering are shown below in Table 4-3.

Table 4-3. Proposed PME Measures.

Proposed PME Measures	Phase 1 Engineering
Year-round flow releases from the existing dam (RM 12)	Yes
Year-round flow releases from the existing dam (RM 12) and excavate the lake outlet	Yes
Year-round flow releases from a new siphon (RM 12)	Yes
Year-round flow releases from a new bypass tunnel (RM 11.5)	Yes
Year-round flow releases from the existing AWWU portal valve (RM 11)	Yes
Year-round flow releases from the existing AWWU pipeline (RM 5.5)	Yes
Reroute Lach Q'atnu Creek back into the Eklutna River	Yes
Groundwater pumping downstream of the existing dam	No
Channel maintenance flows with existing overflow spillway	Yes
Channel maintenance flows with a new radial gate	Yes
Channel maintenance flows with a new fixed wheel gate	Yes
Upstream fish passage with a fish ladder (gravity flow)	Yes
Upstream fish passage with a fish ladder (variable exits)	Yes
Upstream fish passage with a fish ladder (pump station and slide)	Yes
Upstream fish passage with trap and haul	Yes
Downstream fish passage with a spill event	Yes
Downstream fish passage with a floating surface collector	Yes
Downstream fish passage with a rotary screw and guide nets	No
Downstream fish passage through the existing intake	No
Trapping facility with hatchery spawning, rearing, and release	No
Physical habitat enhancement	Yes
New AWWU bridges	Yes
Lakeside trail improvements	Yes

The Project Owners held another Aquatics TWG meeting in February 2023 to present the preliminary 2D modeling results for the river. It was during this meeting that USFWS proposed a nature-like fishway that would go around the existing dam and NVE proposed dam replacement as potential PME measures. The Project Owners held two meetings with USFWS and NVE in March 2023 to discuss both options further. The Project Owners also had several subsequent meetings with Eklutna, Inc. to discuss details of the potential replacement dam.

Ultimately, the stand-alone nature-like fishway was not advanced, but the potential replacement dam was advanced through phase 1 engineering as quickly as possible.

4.4.6 Year 2 Study Reporting

Draft year 2 study reports and phase 1 engineering deliverables were distributed to the TWGs and other interested parties in March 2023 for review and comment. The Project Owners also held a series of TWG meetings in March 2023 to review and discuss the study results. The Project Owners received comments on the draft study reports from ADFG, ADNR, and USFWS. The study reports were then revised and finalized based on comments received. The year 2 study reports and all comments received are available here on the Project website.

4.4.7 Summary of Study Results

In addition to the individual study reports, the Project Owners developed a Draft Summary of Study Results as required by the 1991 Agreement. This document was distributed in October 2023 with the Draft Program (see Section 4.7). The Project Owners did not receive any comments on the Draft Summary of Study Results. The Final Summary of Study Results is provided in Attachment B.

4.5 Alternatives Analysis

The purpose of the alternatives analysis was to evaluate the costs, benefits, and impacts of a range of comprehensive alternatives (which may consist of multiple PME measures) in a consistent manner. This process was not required by the 1991 Agreement; however, the Project Owners felt that it was necessary to bridge the gap between study reporting and issuance of a Draft Program.

Based on the study results, the Project Owners made a commitment early in the alternatives analysis process to provide year-round flow releases into the Eklutna River as part of their Proposed Final Program. Based on this commitment, the primary objectives during the alternatives analysis were to determine how to release water into the Eklutna River and how much water to release for both year-round flows and periodic channel maintenance flows while considering estimated costs and potential impacts.

The alternatives analysis helped to narrow down the list of comprehensive alternatives by removing those that either did not provide a significant benefit, or where multiple alternatives provided similar benefits, those that were more costly could be removed from consideration. The following subsections detail the method of analysis, participation in the process, the purpose of each alternatives analysis meeting, and the comprehensive alternatives that were ultimately evaluated.

4.5.1 Cost Effectiveness and Incremental Cost Analysis

To help inform decision making, a cost effectiveness and incremental cost analysis was conducted to assess the relative benefits and costs of comprehensive alternatives. This method of analysis is an industry standard, developed by the USACE to compare environmental outputs and the economic costs of alternative plans for environmental restoration or mitigation projects. The cost effectiveness analysis compares the annual cost of a proposed alternative with the ecological lift it provides to help identify the least cost alternatives for a given level of environmental benefits.

The ecological lift used as a basis for comparison was the improvements in spawning and rearing habitat for Chinook, coho, and sockeye salmon that would result from providing flow to the Eklutna River, adding fish passage into and out of the lake, changing operation of the lake levels to provide additional lakeshore spawning habitat, or some combination of these measures. The specific gains in habitat were determined using the models that were developed as part of the Instream Flow Study and the results from the Lake Aquatic Habitat and Fish Utilization Study.

To determine the costs of each proposed alternative, the total capital costs, operations and maintenance costs, and replacement energy costs were combined and annualized over 35 years with appropriate escalation factors as described in Attachment C.

4.5.2 Participation

In March 2023, the Project Owners reached out to the Parties, the TWGs, and other stakeholders regarding their interest to participate in the alternatives analysis process. The following entities participated in one or more of the alternatives analysis meetings.

- Alaska Energy Authority (AEA)
- Alaska Department of Fish and Game (ADFG)
- Alaska Department of Natural Resources (ADNR)
    - Water Section
    - Chugach State Park
    - Office of History and Archaeology (OHA)
- National Marine Fisheries Service (NMFS)

- U.S. Fish and Wildlife Service (USFWS)
- Native Village of Eklutna (NVE)
- Eklutna, Inc.
- Anchorage Water and Wastewater Utility (AWWU)
- Trout Unlimited (TU)
- The Conservation Fund (TCF)
- Project Owners

4.5.3 Meetings

The Project Owners held a series of five meetings between April and August 2023 for the alternatives analysis. The general discussion topics for each meeting are summarized below, and the presentations from each meeting are available here on the Project website.

4.5.3.1 Meeting 1

The first alternatives analysis meeting was held on April 6, 2023. At this meeting, seven potential year-round instream flow levels were presented to the group. When developing these potential flow levels, the Project Owners considered the minimum flows needed for upstream migration through the canyon reach, the flows that provide the maximum amount of spawning habitat for Chinook and coho salmon below the dam, the range of flows that would optimize overwintering habitat, and the hydraulic limitations of the proposed PME measures. Corresponding channel maintenance flows for each potential flow level were also presented. The Project Owners also described how the cost effectiveness and incremental cost analysis would be conducted. At the end of the meeting, participants were invited to submit any potential comprehensive alternatives to the Project Owners within two weeks so they could be evaluated before the next meeting. A request form was provided to participants that allowed them to select one of the seven identified flow regimes (or write in a different flow regime) and any combination of the PME measures that were advanced though phase 1 engineering.

After the first meeting, the Project Owners received 33 comprehensive alternatives from eight entities (including the Project Owners). These alternatives were comprised of various flow regimes and PME measures, including flow releases from the existing dam (with and without fish passage), a replacement dam, a new bypass tunnel, the existing AWWU portal valve, or the existing AWWU pipeline. Alternatives also included periodic channel maintenance flows with uncontrolled spill or with a fixed wheel gate. None of the alternatives included the

siphon, rerouting Lach Q'atnu Creek, the radial gate, gravity flow fish ladder, the fish ladder with a pump station and slide, or trap and haul. The Project Owners conducted a cost effectiveness and incremental cost analysis for all 33 comprehensive alternatives.

4.5.3.2 Meeting 2

The second alternatives analysis meeting was held on May 17, 2023. At the beginning of the meeting, the conceptual design and cost estimate for the replacement dam (proposed by NVE in March 2023) were presented to the group. The sediment transport modeling results for each of the proposed channel maintenance flows were also presented. The Project Owners then reviewed the results of the cost effectiveness and incremental cost analysis for each of the 33 comprehensive alternatives that were submitted for evaluation. During the meeting, the group decided to discard the alternatives that involved flow releases from the existing AWWU pipeline (RM 5.5) or a new bypass tunnel because they did not make sense from a cost benefit perspective. Participants were then invited to revise their alternatives based on the information provided and resubmit them for analysis and discussion at Meeting 3.

After the second meeting, the Project Owners received 36 comprehensive alternatives from eight entities (including the Project Owners). Three of the entities had no changes to their alternatives, but five entities submitted revisions, including the Project Owners. The Project Owners conducted a cost effectiveness and incremental cost analysis for all 36 comprehensive alternatives.

4.5.3.3 Meeting 3

The third alternatives analysis meeting was held on June 14, 2023. In response to questions during the previous meeting regarding the feasibility and benefits of fish passage, the Project Owners began this meeting with a review of the downstream fish passage options/challenges and the documented fish habitat in Eklutna Lake and its tributaries. The Project Owners then presented the revised results for each of the revised alternatives. At the end of the meeting, participants were asked to consider the information presented and submit their preferred alternative(s) for analysis and discussion at Meeting 4.

After the third meeting, the Project Owners received 12 preferred alternatives from seven entities (including the Project Owners). Most entities provided one preferred alternative; however, some entities provided more than one preferred alternative (see Section 4.5.4). The Project Owners conducted a cost effectiveness and incremental cost analysis for all 12 preferred alternatives.

4.5.3.4 Meeting 4

The fourth alternatives analysis meeting was held on July 12, 2023. In response to a question from ADFG during the previous meeting regarding potential velocity barriers, the Project Owners presented modeling results for a range of higher flows (80 to 350 cfs) in the canyon reach. It was concluded that these higher flows would not create a barrier to upstream fish migration in the canyon reach. The Project Owners then presented the revised results for each of the preferred alternatives. The total present value of annualized costs (capital, O&M, and replacement energy) for each alternative ranged from $44 million to $385 million over the 35-year program. Potential impacts to CEA and MEA ratepayers and MOA taxpayers were also reviewed, along with results of the cost effectiveness and incremental cost analysis. During the meeting, TCF proposed a hybrid flow release alternative, releasing flows from the existing dam in the summer and the AWWU portal valve in the winter. The Project Owners committed to evaluating this alternative and discussing it at the next meeting. For the remainder of the meeting, the Project Owners reviewed the potential effects, both positive and negative, of the preferred alternatives on other resources including wetlands and wildlife, public water supply, and recreational use and facilities.

4.5.3.5 Meeting 5

The fifth and final alternatives analysis meeting was held on August 9, 2023. The meeting began with a discussion on the potential effects, both positive and negative, of the preferred alternatives on cultural resources. The Project Owners then presented their evaluation of the hybrid flow release alternative that was proposed by TCF in the previous meeting. This alternative ultimately had the same impacts to reservoir operations as releasing flows from the dam year-round and therefore was not advanced any further. The Project Owners then discussed potential adaptive management strategies and proposed using water budgets for both year-round instream flows and periodic channel maintenance flows. A water budget establishes a total amount of water available for release into the Eklutna River each year; adjustments can be made to the flow regime as long as the total volume of water to be released does not exceed the water budget. The remainder of the meeting was an open discussion regarding potential monitoring efforts. At the end of the meeting, the Project Owners invited participants to revise and resubmit their preferred alternatives if needed.

4.5.4 Preferred Alternatives

After the fifth meeting, the Project Owners received 12 preferred alternatives from eight entities (including the Project Owners). Most entities provided one preferred alternative; however, some entities provided more than one preferred alternative. The following subsections detail the components of each entity's preferred alternative(s).

4.5.4.1 Infrastructure Modifications

The infrastructure modifications proposed by each entity for their preferred alternative(s) are shown below in Table 4-4. If an entity provided more than one preferred alternative, then their alternatives were labeled in descending order of preference.

Table 4-4. Infrastructure Modifications for Preferred Alternatives.

Entity	Instream Flows	Channel Maintenance Flows	Upstream & Downstream Fish Passage	Other
NMFS[1]	AWWU Portal Valve	Fixed Wheel Gate	None	Physical Habitat Enhancement New AWWU Bridges Lakeside Trail Repairs
	Replacement Dam	Fixed Wheel Gate	Variable Exit Fish Ladder[2] & Floating Surface Collector	Physical Habitat Enhancement New AWWU Bridges Lakeside Trail Repairs
USFWS Alt A	Replacement Dam	Fixed Wheel Gate	Variable Exit Fish Ladder[2] & Juvenile Bypass Gate[3]	Physical Habitat Enhancement New AWWU Bridges Lakeside Trial Repairs
NVE	Replacement Dam	Fixed Wheel Gate	Variable Exit Fish Ladder[2] & Spill	Physical Habitat Enhancement New AWWU Bridges Lakeside Trail Repairs
TCF	Replacement Dam	Fixed Wheel Gate	Variable Exit Fish Ladder[2] & Spill	None
USFWS Alt B	Existing Dam	Fixed Wheel Gate	Variable Exit Fish Ladder & Floating Surface Collector	Physical Habitat Enhancement New AWWU Bridges Lakeside Trail Repairs
TU	Existing Dam	Fixed Wheel Gate	Variable Exit Fish Ladder & Spill	Physical Habitat Enhancement New AWWU Bridges Lakeside Trail Repairs
USFWS Alt C[4]	Existing Dam	Fixed Wheel Gate	None	Physical Habitat Enhancement New AWWU Bridges Lakeside Trail Repairs
USFWS Alt D[4]	AWWU Portal Valve	Fixed Wheel Gate	None	Physical Habitat Enhancement New AWWU Bridges Lakeside Trail Repairs

Entity	Instream Flows	Channel Maintenance Flows	Upstream & Downstream Fish Passage	Other
ADFG Alt A[5]	AWWU Portal Valve	Fixed Wheel Gate	None	Physical Habitat Enhancement New AWWU Bridges Lakeside Trail Repairs
ADFG Alt B[5]	AWWU Portal Valve	Fixed Wheel Gate	None	Physical Habitat Enhancement New AWWU Bridges Lakeside Trail Repairs
ADNR Parks	AWWU Portal Valve	Existing Gate	None	Physical Habitat Enhancement New AWWU Bridges Lakeside Trail Repairs
Project Owners	AWWU Portal Valve	Existing Gate	None	Physical Habitat Manipulation New AWWU Bridges Lakeside Trail Repairs

1 NMFS's preferred alternative involved implementing the AWWU portal valve and fixed wheel gate as an immediate action (within 5 years as required by the 1991 Agreement), followed by the replacement dam and fish passage as long-term actions to be implemented after the implementation period specified in the 1991 Agreement.

2 The conceptual design for the replacement dam included a variable exist fish ladder with a nature-like entrance for upstream fish passage.

3 The conceptual design for the replacement dam included a juvenile bypass gate for downstream fish passage.

4 USFWS alternatives C and D were only if public and financial support for alternatives A and B could not be obtained.

5 ADFG alternatives A and B had the same infrastructure modifications but different flow regimes.

4.5.4.2 Year-Round Instream Flow Regimes

The year-round instream flow regimes proposed by each entity for their preferred alternative(s) are presented below in Table 4-5.

Table 4-5. Year-Round Instream Flow Regimes for Preferred Alternatives.

Entity	Flow Releases (cfs)											
	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec
NMFS[1]	75	75	75	75	75	160	160	160	160	160	75	75
USFWS Alt A	75	75	75	75	75	160	160	160	160	160	75	75
NVE[2]	65	65	65	65	160	255	350	350	150	150	108	65
TCF[2]	60	60	60	60	100	180	180	180	180	100	60	60
USFWS Alt B	75	75	75	75	75	160	160	160	160	160	75	75
TU[2]	61	61	61	61	134	206	206	206	134	61	61	61

Entity	Flow Releases (cfs)											
	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec
USFWS Alt C	75	75	75	75	75	160	160	160	160	160	75	75
USFWS Alt D[1]	75	75	75	75	75	160	160	160	160	160	75	75
ADFG Alt A	35	35	35	35	50	65	80	80	57	57	46	35
ADFG Alt B	31	31	31	31	41	50	60	60	48	48	39	31
ADNR Parks	27	27	27	27	34	40	40	40	40	40	34	27
Project Owners	27	27	27	27	34	40	40	40	40	40	34	27

[1] Given the infrastructure selected for the NMFS alternative and USFWS Alt D (the AWWU portal valve), the preferred flow regimes shown for these alternatives are not technically feasible.

[2] The NVE, TU, and TCF preferred alternatives include additional releases from the dam for downstream fish passage in April – June, which is not reflected in the instream flow regime presented.

4.5.4.3 Channel Maintenance Flow Regimes

The channel maintenance flow regime proposed by each entity for preferred alternative(s) are presented below in Table 4-6.

Table 4-6. Stakeholders' Preferred Channel Maintenance Flows.

Entity	Flow (cfs)	Duration (Hrs)	Recurrence (Yrs)
NMFS	700	72	3 of 10
USFWS Alt A	700	72	3 of 9
NVE	700	72	Annually
TCF	600	72	3 of 10
USFWS Alt B	700	72	3 of 9
TU	400	72	3 of 10
USFWS Alt C	700	72	3 of 9
USFWS Alt D	700	72	3 of 9
ADFG Alt A	400	72	3 of 10
ADFG Alt B	325	72	3 of 10
ADNR Parks	220	72	3 of 10
Project Owners	220	72	3 of 10

4.5.4.4 Cost Benefit Summary

Each of the preferred alternatives were analyzed as part of the cost effectiveness and incremental cost analysis. A summary of the total annualized costs and present worth of each preferred alternative for the 35-year program is presented below in Table 4-7 and Figure 4-2.

Table 4-7. Cost Summary for Stakeholders' Preferred Alternatives.

Entity	Capital Cost ($M)[1]	O&M Cost ($M)	Replacement Energy Cost ($M)	35-Year Annualized Cost ($M)	35-Year Present Worth ($M)
NMFS	170.8	1.7	4.9	23.5	385
USFWS Alt A	158.7	1.7	4.9	22.4	366
NVE	122.9	0.3	8.4	21.1	346
TCF	118.1	0.3	6.9	18.9	310
USFWS Alt B	88.6	2.1	5.2	17.7	289
TU	28.9	0.6	7.2	13.5	221
USFWS Alt C	18.0	0.5	5.2	8.7	142
USFWS Alt D	16.9	0.2	2.0	4.3	70
ADFG Alt A	16.9	0.2	2.0	4.3	70
ADFG Alt B	16.9	0.2	1.7	3.8	63
ADNR Parks	8.9	0.2	1.3	2.7	44
Project Owners	8.9	0.2	1.3	2.7	44

[1] Capital costs are based on Class 5 OPCC's and carry an expected accuracy range of -50% to +100%.

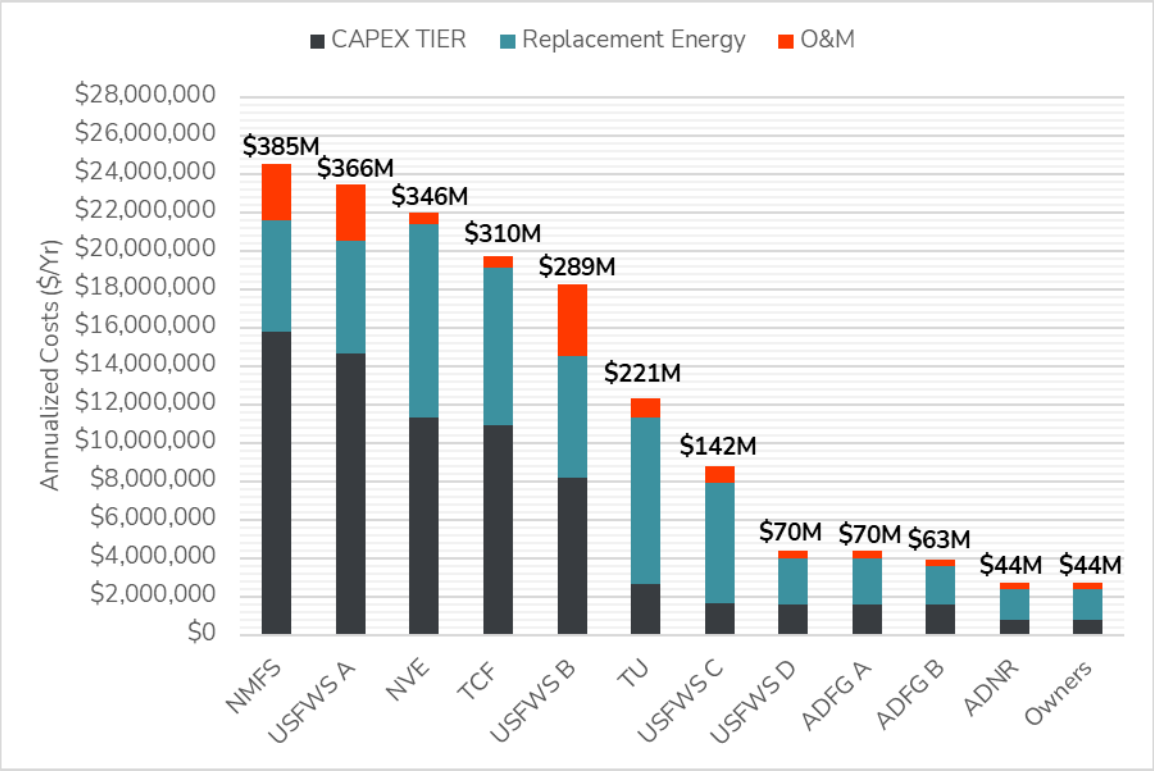

Figure 4-2. Comparison of Annualized Costs and Present Worth for Preferred Alternatives.

The associated ratepayer/taxpayer impacts are presented in Table 4-8. The supporting data for the cost effectiveness modeling is provided in Attachment C.

Table 4-8. Ratepayer/Taxpayer Impacts for Preferred Alternatives.

Entity	Ratepayer Impacts		Property Tax Increase	
	CEA	MEA	MOA	
	(%)	(%)	(mils)	($/100k)
NMFS	+ 4.73%	+ 5.81%	0.076	$7.63
USFWS Alt A	+ 4.53%	+ 5.45%	0.072	$7.21
NVE	+ 4.24%	+ 6.10%	0.046	$4.62
TCF	+ 3.80%	+ 5.29%	0.045	$4.46
USFWS Alt B	+ 3.53%	+ 4.66%	0.052	$5.23
TU	+ 2.38%	+ 4.11%	0.016	$1.60
USFWS Alt C	+ 1.70%	+ 2.96%	0.011	$1.13
USFWS Alt D	+ 0.84%	+ 1.31%	0.008	$0.81
ADFG Alt A	+ 0.84%	+ 1.31%	0.008	$0.81

Entity	Ratepayer Impacts		Property Tax Increase	
	CEA	MEA	MOA	
	(%)	(%)	(mils)	($/100k)
ADFG Alt B	+ 0.76%	+ 1.13%	0.008	$0.81
ADNR Parks	+ 0.53%	+ 0.84%	0.005	$0.51
Project Owners	+ 0.53%	+ 0.84%	0.005	$0.51

The models developed as part of the Instream Flow Study and the results of the Lake Aquatic Habitat and Fish Utilization Study were used to quantify habitat gains for three species (Chinook, coho, and sockeye) and two life stages (spawning and rearing). A summary of the habitat gains for each preferred alternative is presented below in Table 4-9.

Table 4-9. Summary of Habitat Gains for Stakeholders' Preferred Alternatives.

Stakeholder	Habitat Gains (Acres)				
	Chinook Spawning	Coho Spawning	Sockeye Spawning	Chinook Rearing	Coho Rearing
NMFS	3.9	4.0	3.0	15.5	22.8
USFWS Alt A	3.9	4.0	3.0	15.5	22.8
NVE	3.1	3.6	2.5	21.0	31.0
TCF	3.8	3.9	2.7	19.0	28.1
USFWS Alt B	4.9	5.0	4.0	19.1	28.2
TU	4.7	5.0	4.2	18.2	27.1
USFWS Alt C	2.0	2.1	1.1	19.1	28.2
USFWS Alt D	1.5	1.2	0.5	12.6	18.5
ADFG Alt A	1.6	1.6	1.2	8.7	12.7
ADFG Alt B	1.5	1.6	1.2	7.7	11.6
ADNR Parks	1.5	1.6	1.2	6.3	9.9
Project Owners	1.5	1.6	1.2	6.3	9.9

To further assess each preferred alternative, the incremental costs were analyzed to determine the annual spending per acre of habitat gained in the river and lake. This exercise helps to inform the consequences of increasing unit costs to achieve additional habitat gains. A summary of the incremental costs is presented below in Table 4-10.

Table 4-10. Incremental Costs Per Acre of Habitat for Preferred Alternatives.

Entity	Incremental Cost ($/Yr/Acre)				
	Chinook Spawning	Coho Spawning	Sockeye Spawning	Chinook Rearing	Coho Rearing
NMFS	$1,800,000	$1,700,000	$2,300,000	$400,000	$300,000
USFWS Alt A	$6,000,000	$5,900,000	$7,800,000	$1,500,000	$1,000,000
NVE	$5,700,000	$5,600,000	$7,500,000	$1,400,000	$1,000,000
TCF	$7,100,000	$6,100,000	$8,800,000	$1,000,000	$700,000
USFWS Alt B	$5,200,000	$5,100,000	$7,300,000	$1,000,000	$700,000
TU	$2,900,000	$2,700,000	$3,200,000	$700,000	$500,000
USFWS Alt C	$4,400,000	$4,100,000	$7,900,000	$500,000	$300,000
USFWS Alt D	$2,700,000	$2,700,000	$3,600,000	$500,000	$300,000
ADFG Alt A	$2,500,000	$2,400,000	$3,200,000	$500,000	$300,000
ADFG Alt B	$1,800,000	$1,700,000	$2,300,000	$400,000	$300,000
ADNR Parks	$1,800,000	$1,700,000	$2,300,000	$400,000	$300,000
Project Owners	$1,800,000	$1,700,000	$2,300,000	$400,000	$300,000

4.6 AWWU Agreements

After the alternatives analysis, the Project Owners initiated conversations with AWWU in August 2023 to ascertain if AWWU would be willing to allow for potential the use of its infrastructure to release water into the Eklutna River. These conversations concluded with a confidential binding term sheet in October 2023, pursuant to which the Project Owners and AWWU agreed to: (1) broad commercial terms to allow for the construction, interconnection, and operation of the Eklutna River Release Facility and transportation of water for instream flows if the AWWU portal valve alternative was included in the Final Program approved by the Governor; (2) negotiate three definitive contracts elaborating upon such terms prior to the submission of the Proposed Final Program to the Governor:

- A **Water Facilities Interconnection Agreement** to govern the rights and responsibilities of the Project Owners and AWWU with respect to the construction of the Eklutna River Release Facility and eight AWWU bridges over the Eklutna River that will be needed for year-round access to AWWU infrastructure;
- A **Long-Term Water Transportation Agreement** to govern the rights and responsibilities of the Project Owners and AWWU with respect to the transportation of

water from Eklutna Lake, through AWWU infrastructure and the Eklutna River Release Facility, and into the Eklutna River; and

- A **Public Water Supply Agreement** to replace a 1984 agreement between AWWU and the Project Owners governing AWWU's compensation for and use of the Project Owners' water rights to provide drinking water to AWWU customers from Eklutna Lake that expires in 2025.

In March 2024, the Project Owners and AWWU reached agreement on final drafts of these documents, which are provided in Attachment D. While these agreements themselves have not yet been signed by the parties, the parties have signed an amendment to the binding term sheet agreeing that the substantive terms of such documents are complete, provided that certain technical and procedural exhibits will still need to be finalized. The Project Owners and AWWU further agreed that they will execute the agreements upon (1) the approval of the Governor of a Final Program including the use of AWWU facilities as set forth in the Proposed Final Program, (2) the approval by the Anchorage Assembly to the extent necessary for the MOA to execute and perform under the agreements; and (3) any necessary MEA and CEA board approvals.

The binding term sheet and amendment are available here on the Project website.

4.6.1 Water Facilities Interconnection Agreement

The negotiated terms of the Water Facilities and Interconnection Agreement are summarized below.

- The Project Owners shall be responsible for the design, engineering, permitting, constructing, and testing the Eklutna River Release Facility and AWWU Bridges, and shall do such work in compliance with prudent industry standards.

- The proposed design for the Eklutna River Release Facility as developed by the Project Owners must be approved by AWWU.

- The Project Owners shall bear all the costs associated with constructing the Eklutna River Release Facility and will provide certain workmanship and other warranties with respect to the Eklutna River Release Facility for one year after commercial operation.

- AWWU shall provide access to the necessary land and AWWU facilities within its control to allow for such work. The Project Owners shall be responsible for obtaining any necessary third-party approvals for land access, with AWWU assistance.

- After the Eklutna River Release Facility is commercially operable, legal title to a certain portion of the Eklutna River Release Facility including the portions necessary for isolating AWWU's pipeline segment shall pass to AWWU. Legal title to AWWU bridges shall also pass to AWWU.

4.6.2 Long-Term Water Transportation Agreement

The negotiated terms of the Long-Term Water Transportation Agreement are summarized below.

- Beginning upon the commercial operation of the Eklutna River Release Facility and for at least 35 years thereafter, AWWU shall transport water belonging to the Project Owners upon request through AWWU's facilities to the Eklutna River Release Facility to be released into the Eklutna River.

- Under no circumstance shall AWWU be required to deliver water in such a way that will inhibit its ability to deliver a daily flow rate of at least 41 million gallons per day (MGD) to the downstream Eklutna Water Treatment Facility or to exceed the hydraulic capacity or design criteria of the AWWU facilities.

- The parties shall together develop detailed operating procedures before the beginning of the term which will be regularly updated throughout the term.

- As with the Water Facilities Interconnection Agreement, AWWU shall provide access to the necessary land and AWWU facilities within its control to allow for these water transportation services.

4.6.3 Public Water Supply Agreement

The negotiated terms of the Public Water Supply Agreement are summarized below.

- As partial consideration for the services and access to AWWU infrastructure being provided by AWWU pursuant to the Water Facilities Interconnection Agreement and the Long-Term Water Transportation Agreement, the Project Owners have agreed to make available and allow AWWU to continue to interconnect the Eklutna Water Treatment Facility to the Project infrastructure, to use certain of the Project Owners' facilities, and to use a portion of the Project Owners' water rights, up to 41 MGD, all for the public water supply through October 2060.

- In 2055, AWWU will have an option to obtain by transfer of title from the Project Owners' a portion of their first priority water rights up to 41 MGD at no cost to AWWU other than documentation and approvals.

- AWWU shall pay significantly reduced compensation to the Project Owners for associated reductions in electric energy generation.
- The Project Owners will remain responsible for Eklutna Lake reservoir operations and shall operate the reservoir in such a way that the projected allocations of water to AWWU are available upon request at a flow rate of 41 MGD.
- The Project Owners recommit to take no action regarding Eklutna Lake that has the effect of reducing the quality or increasing the turbidity of the lake water or otherwise allow any other action that might have the effect of reducing its suitability for use as a source of public water supply.

4.7 Draft Fish and Wildlife Program

Per the 1991 Agreement, the Project Owners distributed a Draft Program (with the Draft Summary of Study Results) to the Parties in October 2023. Both documents were also provided to NVE.

In the Draft Program, the Project Owners proposed to utilize the existing AWWU water supply infrastructure to provide a robust year-round base instream flow regime to 11 out of 12 miles of the Eklutna River and benefit all four species of salmon that are currently observed spawning in the lower river, while implementing measures to protect the public water supply and minimizing impacts to ratepayers, taxpayers, carbon emissions, and recreation. The proposed flows were determined based on modeling results and were designed to optimize habitat gains while minimizing the costs of replacement energy. The Draft Program also proposed periodic peak flows to maintain downstream fish habitat, construction of eight new bridges for the AWWU water supply access road, a funding commitment for monitoring studies, and an adaptive management framework. Due to the significant costs, impacts, and uncertainty regarding the viability of introducing anadromous species above the Project dam, no fish passage related facilities or changes in operations were proposed at that time.

The Parties and NVE had 30 days to review and provide comments to the Project Owners. The Project Owners received comment letters from ADFG, ADNR, NMFS, USFWS, NVE, and Eklutna, Inc. The Draft Program, Draft Summary of Study Results, and all comments received are available here on the Project website. Responses to comments on the Draft Program are provided in Attachment E.

In their comment letter dated December 4, 2023, NVE proposed a new alternative that involved the removal of Eklutna Dam “within ten years when sufficient renewable power generation is available to offset the lost power generation from dam removal.” In response to this letter, the Project Owners committed to evaluate dam removal in further detail. A

memorandum documenting this evaluation is provided in Attachment F. This alternative was not selected for the Proposed Final Program for reasons described in Section 4.12.2.

4.8 Attempt to Resolve Differences

Per the 1991 Agreement, the Project Owners were required to attempt to resolve differences with the Parties giving due weight to their recommendations, expertise, and statutory responsibilities. The Project Owners held individual meetings with each of the Parties in December 2023 to discuss their comments on the Draft Program. The Project Owners continued to meet with the Parties through April 2024 and made substantive changes to the proposed program based on these discussions.

The Project Owners also met with NVE in December 2023 to discuss their comments on Draft Program and underlying interests. NVE declined to meet with the Project Owners again until March 2023, at which point the Project Owners presented the substantive changes to the program that had been negotiated with the Parties. Subsequent to this meeting, NVE proposed a new alternative that still involved the removal of Eklutna Dam by 2034 once 40 MW of replacement renewable energy is secured. In addition, NVE's new proposal also included the construction of a pump station that would pump water from deep in Eklutna Lake to the pond upstream of Eklutna Dam, and then release water from the dam into the river year-round. This alternative was not selected for the Proposed Final Program for reasons described in Section 4.12.3.

4.9 Public Meetings

After meeting with the Parties and NVE in December 2023 to attempt to resolve differences, the Project Owners were required to hold at least two public meetings, one in Anchorage and one in the Matanuska-Susitna Valley. The Project Owners ultimately held six public meetings, two in Anchorage, two in Palmer, and two in Eagle River. For each location, one meeting was held in the afternoon and one in the evening. All six meetings were held in January 2024 and were an open house format with a brief presentation followed by an opportunity for participants to meet with the Project Owners and their subject matter experts, ask questions, and submit comments. Members of the public had an opportunity to submit both written comments to the Project Owners using the comment forms provided at the public meetings or electronically via the Project website or email. Members of the public also had an opportunity to record their verbal comments at the public meetings.

The public comment period was open from October 27, 2023, when the Draft Program was issued, through February 19, 2024, one month after the last public meeting. The Project Owners received a total of 1,672 public comments, including 1,299 form letters. Individual

comments primarily addressed dam removal and the Draft Program, with comments supporting and opposing both dam removal and the Draft Program essentially evenly split. All of the form letters called for removal of Eklutna Dam; however, most of these form letters were from out of state. The Public Comment Summary and Analysis is provided in Attachment G.

4.10 Proposed Final Fish and Wildlife Program

After five years consultation, study, and analysis, the Project Owners are excited to submit their Proposed Final Program to the Governor. The Project Owners believe that the Proposed Final Program substantively protects, mitigates, and enhances fish and wildlife impacted by the Project, while balance costs and potential impacts to municipal water supply and recreation. The primary components of the Proposed Final Program are summarized below.

- Construction of the Eklutna River Release Facility adjacent to the AWWU portal valve and establishment of year-round instream flows in the Eklutna River.
- Automation of the existing outlet gate at the dam to provide periodic channel maintenance flows in the Eklutna River.
- Construction of eight new bridges along the AWWU access road to enable AWWU's access to critical infrastructure year-round following the establishment of instream flows.
- Payment to Chugach State Park for lakeside trail repairs.
- Establishment of a Committee to oversee implementation of the Monitoring and Adaptive Management Plan.
- Funding to conduct monitoring studies in the Eklutna River throughout the 35-year program.
- Funding for physical habitat enhancement in the Eklutna River based on the monitoring results.
- Procedures for the Committee to adaptively manage the flow regime in the Eklutna River based on the monitoring results.
- Provisions for banking water in Eklutna Lake and potentially increasing the water budget for instream flows in the future.

- Potential installation of a fixed wheel gate to accommodate higher inflows in the future and/or allow higher channel maintenance flows if needed.
- Potential installation of upstream and downstream fish passage facilities in the future if specific criteria are met.

Approval of the Proposed Final Program will enable the Project Owners to implement these significant fish and wildlife measures at the Project, while simultaneously protecting the municipal water supply and continuing to provide low cost, renewable energy to Southcentral Alaska. A comparison to existing conditions is provided in Attachment H. The Design Documentation Reports (DDRs) are provided in Attachment I.

4.10.1 Anticipated Benefits to Fish and Wildlife

Based on modeling results, the default flow regime should create significant new spawning and rearing habitat for salmon in the Eklutna River. The expected spawning and rearing habitat gains for Chinook and coho salmon are presented in Table 4-11.

Table 4-11. Chinook and Spawning and Rearing Habitat Gains.

	Chinook Habitat		Coho Habitat	
Criteria	**Spawning**	**Rearing***	**Spawning**	**Rearing***
Baseline Habitat (Acres)	0.7	11.8	2.5	14.7
Total Habitat with Proposed Base Flows (Acres)	2.2	18.1	4.1	24.6
Percent Gain	209%	53%	65%	67%
% of Maximum Available Habitat Below the AWWU Portal Valve	96.5%	n/a	99.6%	n/a
% of Maximum Available Habitat in the Eklutna River	81.7%	n/a	83.7%	n/a

*The % of maximum available habitat is not shown for Chinook or coho rearing habitat because the flow needed to achieve maximum rearing habitat for both species appears to be higher than the range of flows that was modeled.

The spawning habitat curves for Chinook and coho salmon habitat downstream of the AWWU Portal Valve are presented in Figure 4-3. Spawning and rearing habitat gains are presented graphically in Figure 4-4 and Figure 4-5, respectively.

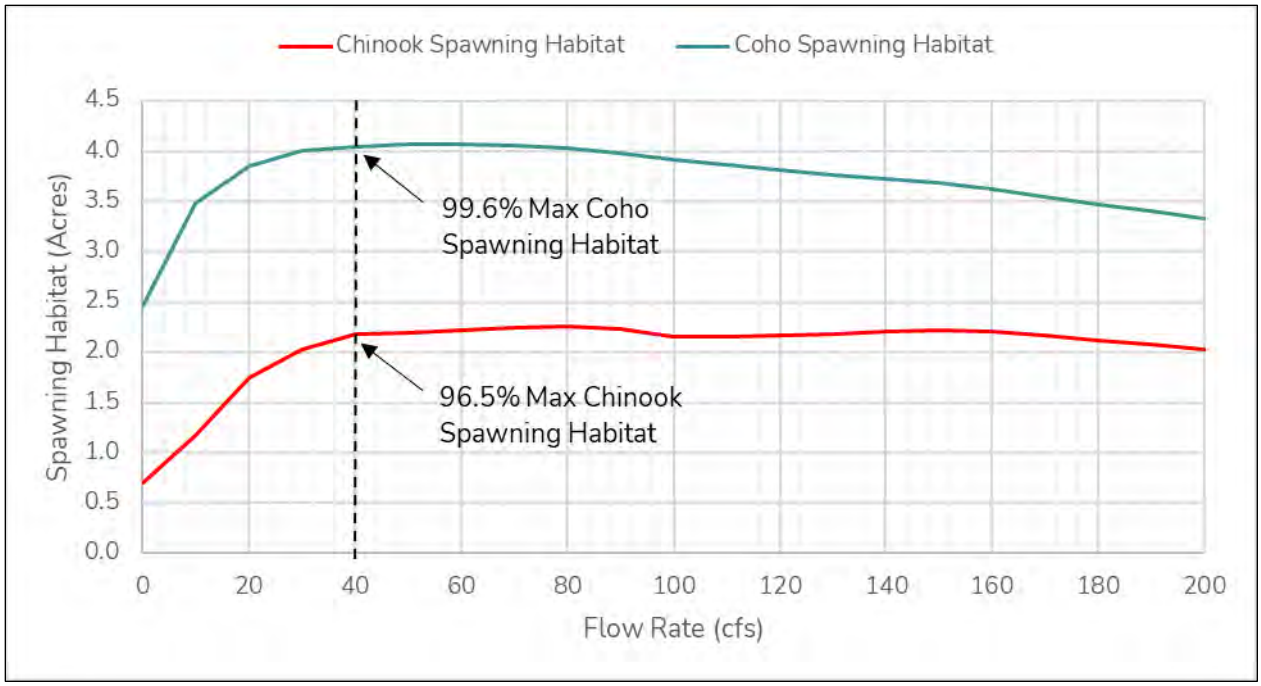

Figure 4-3. Spawning Habitat Curves for the Eklutna River below the AWWU Portal Valve.

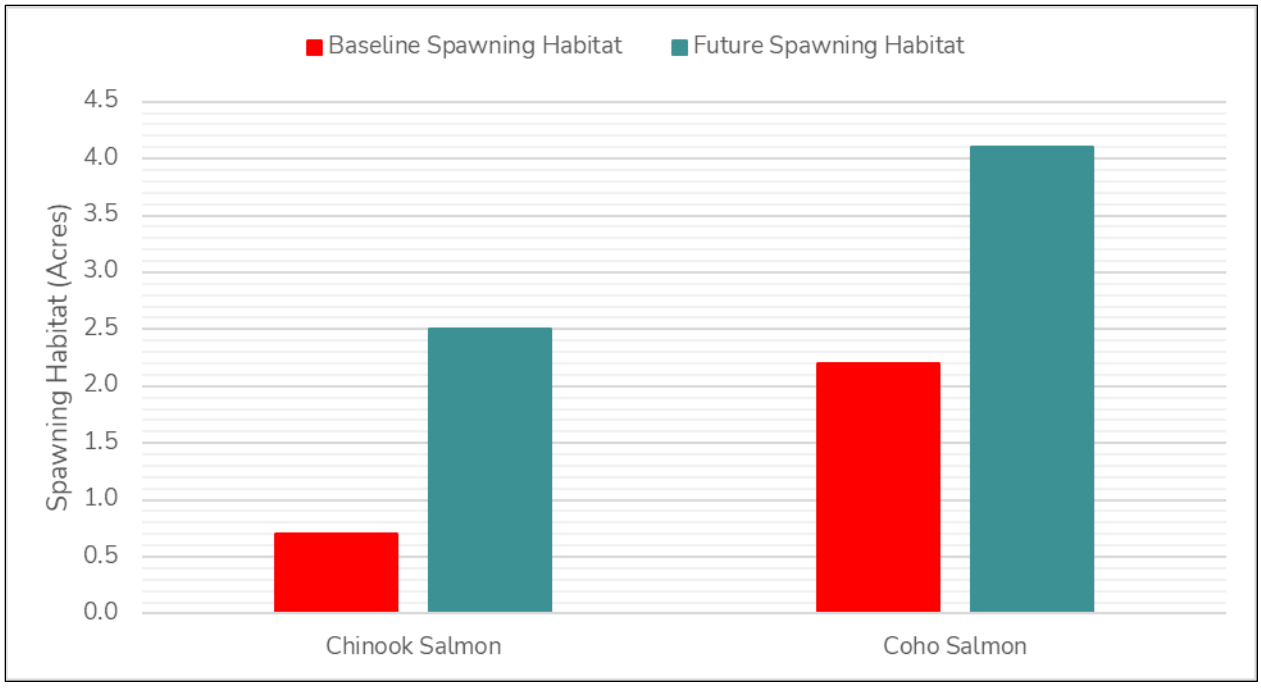

Figure 4-4. Spawning Habitat Comparison, Baseline vs. Future Flow Conditions.

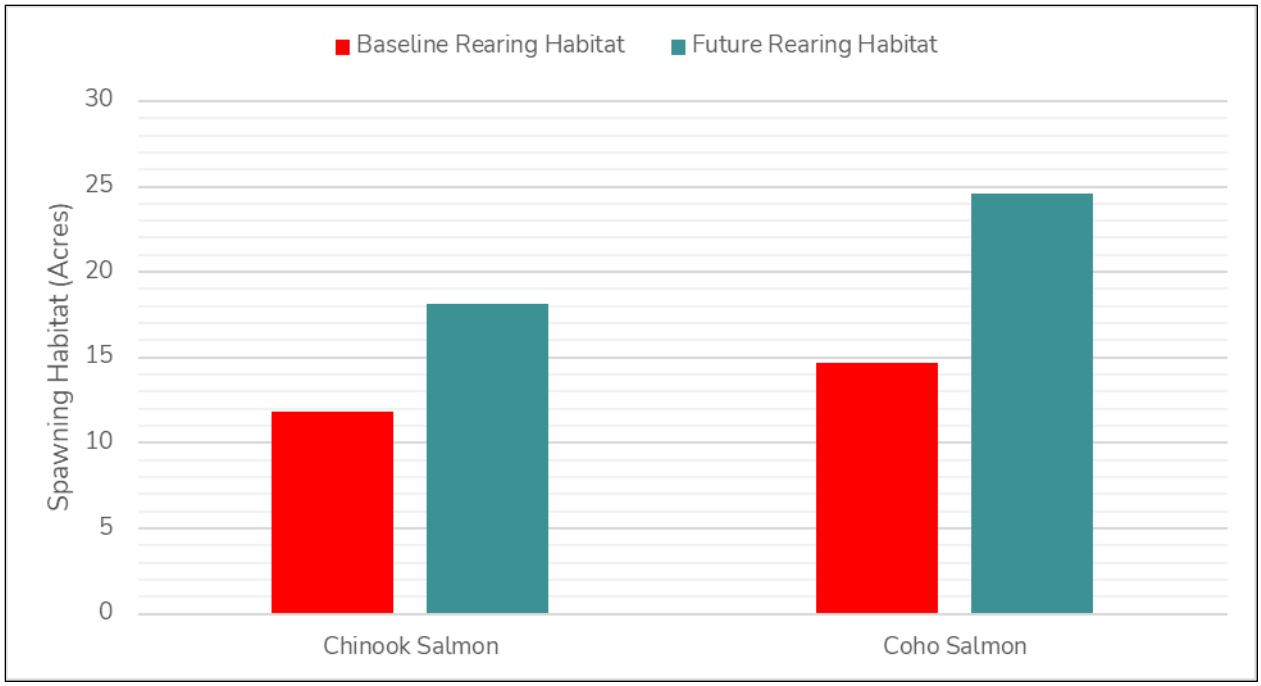

Figure 4-5. Rearing Habitat Comparison, Baseline vs. Future Flow Conditions.

Additional habitat gains for pink and chum salmon are expected to be similar to the prior two species but were not quantified as part of the study program. While these flow releases may also create potential spawning habitat for sockeye in the river, they are unlikely to create rearing habitat for sockeye since sockeye typically rear in lakes. Therefore, the potential spawning habitat for sockeye in the river is not shown. It should be noted that the limited reopener for fish passage (Section 4.2 of the Proposed Final Program) creates the opportunity to benefit sockeye in the future. Increased flow and salmon abundance will also directly or indirectly benefit several ecologically and/or culturally important wildlife species, including:

- Bears, especially brown bears (direct foraging)
- Moose (increased plant nutrients and forage; however, moose could also be negatively impacted as a result of increased bear densities)
- Wolves (direct foraging and potentially higher prey base)
- River otters and mink (direct foraging)
- Beavers (beaver dams would also create salmon rearing habitat)
- Piscivorous birds
- Marine mammals

4.10.2 Anticipated Costs

A Class 4 OPCC with an accuracy range of -30% to +50% was developed for the capital improvements proposed in the Proposed Final Program. Both the capital costs and the O&M costs for the proposed improvements increased from the Class 5 OPCC in part due to modifications to the design that were requested by AWWU. Due to uncertainties whether the fixed wheel gate PME measure will be implemented in the future, the costs are broken out into total program costs with and without the fixed wheel gate.

The costs for implementing the Proposed Final Program will be distributed among the Project Owners based on their ownership percentages and long-term power purchase agreements that modify allocations of costs related to the 1991 Agreement. The resulting allocations are as follows:

- CEA is responsible for 64.29% of all costs, including Capital Costs, O&M Costs, and Replacement Energy Costs.
- MEA is responsible for 16.67% of the Capital Costs and O&M Costs, and 35.71% of Replacement Energy Costs.
- MOA is responsible for 19.04% of the Capital Costs and O&M Costs but does not incur any Replacement Energy Costs.

The total anticipated costs for the Project Owners to implement the Proposed Final Program are presented below in Table 4-12.

Table 4-12. Cost Summary for the Proposed Final Program.

Cost Description	Value
Capital Costs	
ERRF Capital Cost ($)[1]	$10,106,130
Dam Outlet Modifications Capital Cost ($)[1]	$769,373
AWWU Bridges Capital Cost ($)[1]	$4,558,256
Lakeside Trail Repairs ($)	$234,000
Monitoring Program Cost ($)	$450,000
Physical Habitat Enhancement ($)	$350,000
Fixed Wheel Gate ($)[1] *if implemented*	$4,015,100[2]
Subtotal Capital Costs w/o Fixed Wheel Gate ($)	$16,467,759
Subtotal Capital Costs w/ Fixed Wheel Gate ($)	$20,482,860

Cost Description	Value
O&M Costs	
ERRF O&M Cost ($/Yr)	$227,500
Dam Outlet Modifications O&M Cost ($/Yr)	$88,400
Subtotal O&M Costs ($/Yr)	$315,900
Replacement Energy Costs	
Average Annual Energy Reduction (MWh)	15,749
Replacement Energy Costs ($/MWh)	$84.65
Replacement Energy Cost ($/Yr)	$1,333,188
Annualized Costs w/o Fixed Wheel Gate	
Total Annualized Cost ($/Yr)	$3,555,527
CEA Share of Total Annualized Cost ($/Yr)	$2,360,729
MEA Share of Total Annualized Cost ($/Yr)	$897,638
MOA Share of Total Annualized Cost ($/Yr)	$297,160
Estimated Present Value of Total Annualized Costs ($)	$58,218,000
Annualized Costs w/ Fixed Wheel Gate	
Total Annualized Cost ($/Yr)	$3,898,161
CEA Share of Total Annualized Cost ($/Yr)	$2,599,245
MEA Share of Total Annualized Cost ($/Yr)	$955,068
MOA Share of Total Annualized Cost ($/Yr)	$343,848
Estimated Present Value of Total Annualized Costs ($)	$63,828,000[2]

[1] Capital costs at this level of design have an expected accuracy range of -30% to +50%.

[2] The Project Owners' maximum commitment to the fixed wheel gate is $10M, which would raise the Program's capital costs to about $26.5M and its 35-year present value to $72.2M.

Each Project Owner will be responsible for paying its proportionate share of the costs associated with implementing the Final Program. It is too early to determine whether and when such costs will be recovered in rates because any rate recovery will be determined through a rate-setting regulatory process before the Regulatory Commission of Alaska (RCA). Similarly, it is premature to estimate that the costs incurred by the MOA ill exceed its revenues under its long-term power purchase agreements such that the MOA will have to raise taxes Assuming that all such costs are passed directly through as increases to rates and taxes, however, the maximum ratepayer impacts for each utility and potential tax implications of these annualized costs are summarized in the following table.

Table 4-13. Summary of Ratepayer Impacts for Proposed Program.

Fish and Wildlife Program w/ Fixed Wheel Gate	
Cost Description	**Value**
CEA Rate Impact	+0.78%
MEA Rate Impact	+1.07%
MOA Property Tax Impact	.010 mils[1]

[1] 1 mil is $100 per $100,000 of taxable property value.

4.10.3 Implementation Schedule

The schedule for the remainder of the consultation process and implementation of the Final Program is outlined below in Table 4-14.

Table 4-14. Remaining Consultation Process and Implementation Schedule.

Entity	Milestone	Deadline
Parties	Provide comments to the Governor	June 24, 2024
Project Owners	Provide responses to the Governor	July 24, 2024
Governor	Issues the Final Program	October 2, 2024
Project Owners	Feasibility study for the fixed wheel gate	October 2, 2027
Project Owners	Begin implementation	October 2, 2027
Project Owners	Complete implementation (establish instream flows)	October 2, 2032
Project Owners	Reallocation of any additional inflows to the reservoir	October 2, 2042[1]
Committee	Limited reopener for the fixed wheel gate	October 2, 2042[1]
Committee	Limited reopener for fish passage	Any time after October 2, 2042[1]
Project Owners	Reallocation of any additional inflows to the reservoir	October 2, 2052[1]
Project Owners	Repeat the process called for by the 1991 Agreement	October 2, 2057

[1] These dates may change based on the actual date instream flows are established.

4.10.3.1 Review and Comment Period

The Parties will have 60 days to submit written comments on the Proposed Final Program and any alternative recommendations to the Governor. The Project Owners will then have 30 days to submit written responses to the Governor.

4.10.3.2 Final Fish and Wildlife Program

The Governor shall review the Proposed Final Program, supporting information, comments, and any alternative recommendations. The Governor shall attempt to reconcile any differences between the Parties, giving due weight to the recommendations, expertise, and statutory responsibilities of the resource management agencies and the Project Owners. In order to ensure that the Project is best adapted for power generation and other beneficial public uses, the Governor is required by the 1991 Agreement to give equal consideration to:

1. Efficient and economical power production
2. Energy conservation
3. The protection, mitigation of damages to, and enhancement of fish and wildlife (including related spawning grounds and habitat)
4. The protection of recreational opportunities
5. Municipal water supplies
6. The preservation of other aspects of environmental quality
7. Other beneficial public uses
8. Other requirements of State law

Based on his review, the Governor shall establish a Final Program that adequately and equitably protects, mitigates damages to, and enhances fish and wildlife resources affected by the Project. The Project Owners anticipate the Governor's issuance of a Final Program no later than October 2, 2024.

4.10.3.3 Additional Requirements to Implementing the Final Program

After the Governor's issuance of the Final Program in October 2024, the Project Owners will have three years to achieve the following additional requirements that are preconditions to the Project Owners' ability to implement the Final Program. Should any of these requirements fail to be achieved, the Project Owners may not be able to execute the Final Program.

- **AWWU Agreements:** As described in Section 4.6, the Project Owners and AWWU have reached agreement on the final drafts of all three agreements provided in Attachment D. The Project Owners and AWWU will execute these agreements upon (1) the approval by the Anchorage Assembly to the extent necessary for the MOA to

execute and perform under the agreements; and (2) any necessary MEA and CEA board approvals.

- **Water Right:** As described in Section 2.1.9, the Project Owners' current Certificate of Appropriation (ADL 44944) allows the Project Owners to use any and all of the natural inflow to Eklutna Lake for hydroelectric power generation, except that which is used for public water supply (up to 41 MGD). Therefore, in order for the Project Owners to intentionally release water into the Eklutna River for the purposes of creating fish habitat, ADNR must amend the current water right to allow for such use.

- **Land Rights:** As described in Section 2.1.10, the proposed Eklutna River Release Facility is located within AWWU's easement on BLM land that's managed as part of Chugach State Park. Therefore, the Project Owners anticipate that various land rights (rights of way, easements, etc.) will be required for both temporary and permanent infrastructure related to constructing the Eklutna River Release Facility. The Project Owners will also evaluate the need for any land rights that may be needed for both temporary and permanent infrastructure related to constructing the new AWWU bridges. Chugach State Park is responsible for obtaining any approvals that might be needed for the lakeside trail repairs. The Project Owners do not need any additional land rights for automation of the existing gate at the dam.

- **Dam Safety:** Per ADNR, the Project Owners will be required to update the current O&M manual for Project and seek approval from ADNR to maintain compliance with state dam safety regulations. Automation of the existing gate at the dam may also require a Certificate of Approval to Modify the Dam from ADNR. If the fixed wheel gate is implemented, the Project Owners will work closely with the State Dam Safety Engineer throughout design and construction to ensure compliance with all regulations.

- **Historic Properties:** Per ADNR, the automation of the existing gate at the dam would likely not be considered an adverse effect to the historic property. The Project Owners will seek concurrence from the State Historic Preservation Officer (SHPO) on this determination. If the fixed wheel gate is implemented, the Project Owners will consult with the SHPO at that time regarding a new determination of effect.

- **Permits:** The Project Owners will work with the relevant entities to determine if any other permits may be required and will seek to obtain such permits as needed.

4.11 Measures Not Selected for the Proposed Final Program

This section presents alternative means of mitigating Project impacts that were identified by others and evaluated during the alternatives analysis process described in Section 4.5.

4.11.1 Higher Flow Releases from the AWWU Portal Valve

Of the 12 preferred alternatives, five included using the AWWU portal valve to deliver flow into the Eklutna River. Three of these preferred alternatives proposed flow regimes higher than that of the Project Owners' Proposed Final Program. The increased flows are technically feasible to be released at the AWWU portal valve and provide increased habitat; however, the incremental gains in habitat are minor and result in significantly larger incremental unit costs, as presented in Figure 4-6.

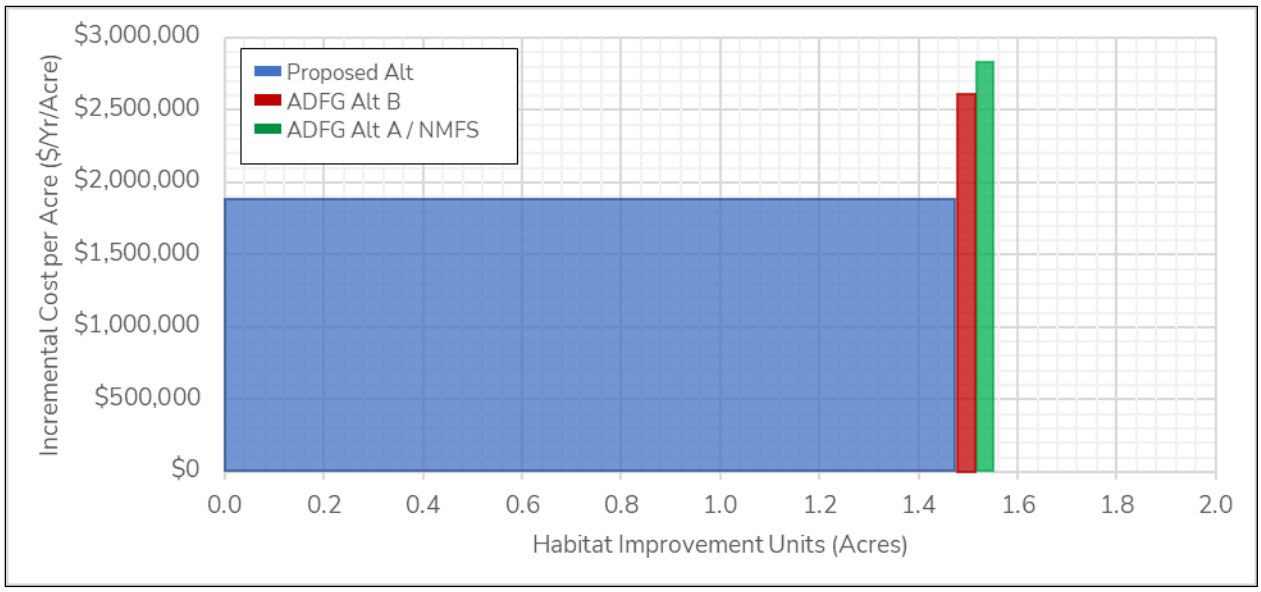

Figure 4-6. Incremental Cost Comparison – AWWU Portal Release Facility.

An additional means of analyzing the incremental gains of higher flow releases from the AWWU portal release facility is to quantify habitat improvements as a function of the maximum spawning habitat in the river. The Proposed Final Program year-round flow release enhances 82% of maximum spawning habitat for Chinook and 84% of the maximum spawning habitat for coho. In comparison, the higher flow release alternatives from the Eklutna River Release Facility have minor gains of approximately 1% - 3% of Chinook spawning habitat and 0.2% - 0.3% of coho spawning habitat. A comparison of the habitat change as a percentage of maximum available riverine habitat is presented in Table 4-15.

Table 4-15. Habitat Gains Comparison – AWWU Portal Release Facility.

Comprehensive Alternative	Chinook		Coho	
	Flow Rate in July/Aug (cfs)	Habitat Gain (% of Max River Habitat)	Flow Rate in Sep/Oct (cfs)	Habitat Gain (% of Max River Habitat)
Selected Alternative	40	82%	40	84%
ADFG Alt B	60	83%	48	84%
ADFG Alt A	80	85%	57	84%

4.11.2 Flow Releases from the Existing AWWU Pipeline

The AWWU pipeline segment P-4 runs along the Eklutna River from RM 5.5 to RM 11.0. Similar to the design of the Eklutna River Release Facility at the AWWU portal valve, an alternative was originally proposed to build a river release structure on the existing pipeline at or near RM 5.5, to take advantage of additional pipeline pressure resulting in a more compact facility. This location would have also eliminated the need to improve upstream AWWU road fords. This alternative was ultimately not selected as a preferred alternative due to the significant reduction in habitat that would benefit from releases. A summary of the gains in habitat if the preferred flow regime is released at the AWWU portal valve rather than RM 5.5 is presented in Table 4-16.

Table 4-16. Habitat Gains Comparison – AWWU Pipeline Release Facility.

Description	Chinook Spawning	Coho Spawning	Chinook Rearing	Coho Rearing
Habitat Gains (Acres) with AWWU Portal Releases	1.5	1.6	6.3	9.9
Habitat Gains (Acres) with AWWU Pipeline Releases	0.3	0.8	3.3	4.7
Incremental Cost ($/Yr/Acre) for AWWU Portal Releases	$1,833,000	$1,696,000	$428,000	$273,000
Incremental Cost ($/Yr/Acre) for AWWU Pipeline Releases	$8,486,000	$3,594,000	$860,000	$601,000

4.11.3 Flow Releases from a New Bypass Tunnel

As an alternative to the Eklutna River Release Facility at the AWWU portal valve, which utilizes the existing AWWU diversion tunnel, an alternative was brought forth to construct a new bypass tunnel in parallel to the existing AWWU tunnel complete with a river release facility at RM 11.5. This alternative was ultimately not selected due to the substantial capital costs to provide the same environmental benefits as using the AWWU portal valve. A comparison of the new bypass tunnel with the AWWU portal valve is presented in Table 4-17.

Table 4-17. Habitat Gains Comparison – New Bypass Tunnel Release Facility.

Description	Chinook Spawning	Coho Spawning	Chinook Rearing	Coho Rearing
Habitat Gains (Acres) with Portal Releases	1.5	1.6	6.3	9.9
Habitat Gains (Acres) with New Bypass Tunnel	1.5	1.6	6.3	9.9
Incremental Cost ($/Yr/Acre) for Portal Releases	$1,833,000	$1,696,000	$428,000	$273,000
Incremental Cost ($/Yr/Acre) for New Bypass Tunnel	$5,373,000	$5,037,000	$1,279,000	$814,000

4.11.4 Flow Releases from the Existing Dam

A measure that was included in three of the 12 comprehensive alternatives proposed by stakeholder groups was to modify the existing dam to release water into the river continuously. In doing so, operations of the reservoir would need to change substantially from current operations. In an average year, the water surface elevation fluctuates from El. 867.0 ft (local datum) to El. 830.0 ft with the ability to draw down to El. 814 ft if necessary. Releases year-round at the existing dam would require the reservoir to remain above El. 861 ft to maintain connectivity with the existing outlet gate at the dam. A representation of the proposed reservoir operation if flow releases were made at the existing dam compared to current operations is presented in Figure 4-7.

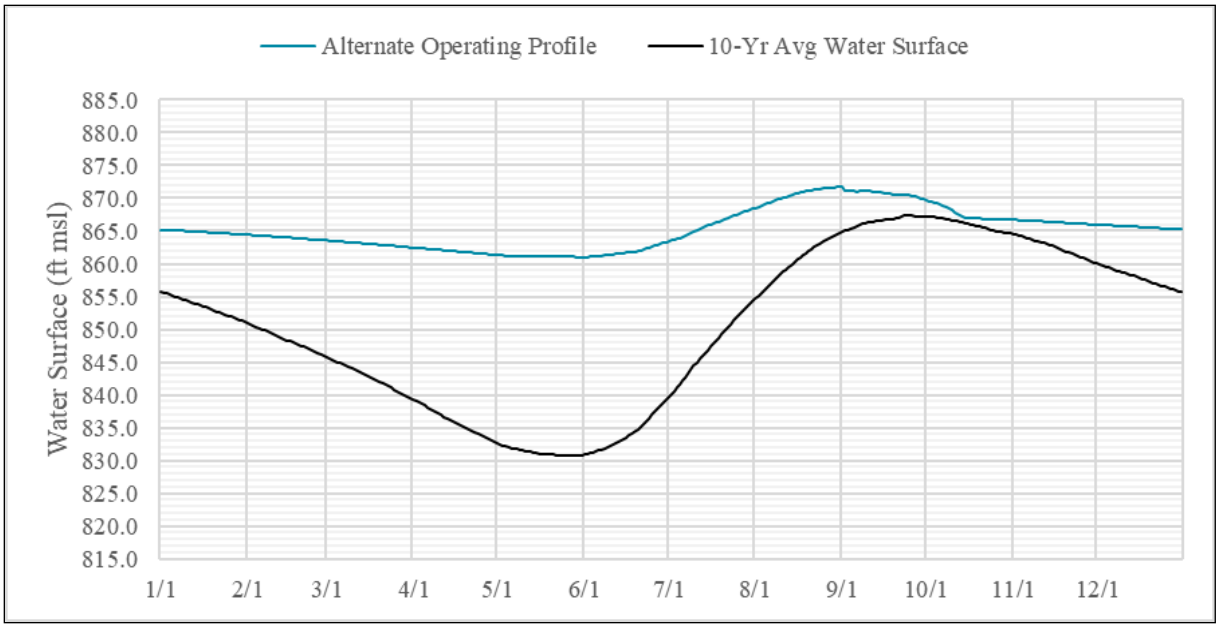

Figure 4-7. Water Surface Elevation Comparison – Existing Dam Releases.

This alternative was ultimately not selected due to the elimination of over 80% of the reservoir storage from being utilized for power generation purposes. Due to the reduction of inflows throughout the winter and the need for maintaining the reservoir above El. 861 ft for river release purposes, the powerhouse is unable to operate for up to eight months of the year. This results in a substantial loss of power generation when grid demand is highest, violates power capacity reserve requirements throughout the winter for MEA, and presents an unacceptable risk to the Project Owners.

4.11.5 Lach Q'atnu Creek Reroute

A proposal to provide year-round natural flows into the Eklutna River included the re-route of Lach Q'atnu Creek from its current path into Eklutna Lake to a location approximately 1,000 feet downstream of Eklutna Dam. Stream gauging records of the creek as part of the study program revealed negligible inflows in the winter (<1 cfs) with daily mean flow rates >10 cfs for about 30 days in the summer. Engineering challenges with the proposed reroute of the creek involve the risk of channel migration through the alluvial fan over time and the encroachment onto private property in the vicinity of the proposed alignment. For these reasons the cost associated with the re-routing combined with the risk of impacting private property deemed this alternative unsuitable for further analysis and was excluded from all preferred alternatives.

4.11.6 Channel Maintenance Flows with Uncontrolled Spill

Intentionally spilling water through the existing overflow spillway was considered for providing periodic channel maintenance flows to the Eklutna River. However, this PME measure was ultimately not selected because of the inherent risk associated with an uncontrolled spill event. In addition, it would require the reservoir to be raised above El. 871 ft which would cause more erosion of the lakeside trail and would limit the time of year when channel maintenance flows could be provided.

4.11.7 Channel Maintenance Flows with Radial Gate

The Project Owners considered adding a radial gate on top of the existing overflow spillway in order to provide controlled spill for periodic channel maintenance flows. However, this PME was ultimately not selected because it would still require the reservoir to be raised above El. 871 ft which would cause more erosion of the lakeside trail and would limit the time of year when channel maintenance flows could be provided.

4.11.8 Channel Maintenance Flows with Fixed Wheel Gate

During the consultation process, several stakeholders requested that the existing overflow spillway be replaced with a fixed wheel gate because either (1) climate change may cause inflows to the reservoir to increase significantly, which may increase the likelihood of future spill events, and a fixed wheel gate will allow the Project Owners to better manage those future spill events, or (2) while modeling results show that the default channel maintenance flow regime will maintain spawning gravels in the wetted reach of the Eklutna River, future monitoring may show that a higher magnitude channel maintenance flow that exceeds the combined hydraulic capacity of the existing outlet gate and the Eklutna River Release Facility may be warranted. Replacement of the existing overflow spillway with a new fixed wheel gate was evaluated during the study program and alternatives analysis and the Project Owners determined that it was not warranted at this time due to the need to perform additional design analysis to confirm whether significant dam safety concerns might exist, and the need for future monitoring of habitat conditions under the proposed flow regime. Recognizing that the fixed wheel gate might be warranted in the future, however, the Project Owners will continue to investigate the fixed wheel gate and will construct it if certain criteria are met.

4.11.9 Fish Passage

The Traditional Ecological Knowledge (TEK) from NVE indicates that there was a sockeye salmon run in Eklutna Lake before the lower dam was constructed in 1929. However, in a 2011 report, the USACE stated “It is doubtful that significant numbers of sockeye salmon ever spawned in the Eklutna River drainage because suitable spawning area upstream of the lake is

limited and water quality in the lake would likely have limited opportunities for spawning in the littoral zone of the lake. Fully 80 percent of the water entering Eklutna Lake comes from two glacial streams that would not be conducive to the consistent survival of sockeye salmon from egg to fry, and the remaining spawning area would not be sufficient to support large numbers of spawning anadromous salmon. In addition, the physical limnology studies of Eklutna Lake suggest that the turbidity in Eklutna Lake during much of the year is not conducive to significant primary production."

A separate study was conducted by Loso et al. to try to determine "whether there was an anadromous salmon run into Eklutna Lake prior to 1929" by using marine derived nutrients (MDN) as a biochemical marker in lake sediment. The study found that there was no significant difference in the composition of sediment layers from before and after 1929. However, a sensitivity test was conducted to assess the possibility that a small salmon run may have gone undetected by the isotopic analysis. It was determined that "a salmon run of up to 1,000 per year, and potentially as many as 15,000 per year, would be possible without noticeably altering the measured isotopic composition of the sediments in Eklutna Lake." Therefore, the results "provide no evidence that such runs occurred, but do not preclude the possible existence of a relatively small sockeye fishery in Eklutna Lake before 1929."

During the consultation process, several stakeholders requested that upstream fish passage of adult salmon into Eklutna Lake and downstream fish passage of juvenile salmon out of Eklutna Lake be evaluated. All fish passage measures proposed by the Project Owners and other stakeholders were evaluated during the study program and alternatives analysis (see Section 4.5). All of the volitional upstream fish passage measures that were evaluated either (1) would have significant impacts to the hydropower project (i.e., would reduce the storage capacity of the reservoir by approximately 40% or would require the Project powerhouse to be shutdown throughout the winter when energy is needed most), or (2) are cost prohibitive (the estimated present worth for the stakeholders' preferred alternatives that included volitional fish passage ranged from $221M to $385M including capex, operations and maintenance, and replacement energy). In addition, there are still significant concerns regarding the effectiveness of all the downstream fish passage facilities studied (i.e., low attraction flow velocities and/or the inability to operate the downstream fish passage facilities while the lake is frozen over). Therefore, fish passage measures are not proposed at this time. The lake study results and justification for the exclusion of each measure from the Project Owners' Proposed Final Program are presented in the following subsections.

Nonetheless, the Project Owners recognize that fish passage may become feasible in the future and that fish passage is important to NVE and the federal resource management agencies. The Project Owners have therefore included a limited reopener for fish passage in the Proposed Final Program.

4.11.9.1 Lake Studies

Much of the Eklutna Lake shoreline is steep, bouldery, or characterized by fine silt and grasses. The remaining shorelines that could be accessed during the study program (above the waterline) contained ~1.5 acres of potential habitat for lakeshore-spawning ocean-run salmon such as sockeye.

Most tributaries to Eklutna Lake are too steep to provide significant spawning or rearing habitat for ocean-run salmon. The only lake tributaries with accessible low-gradient habitat suitable for the migration and spawning of ocean-run salmon are the East and West Forks of Eklutna Creek where an estimated 0.77 – 3.61 acres of potential spawning habitat was documented based on water depth and substrate size. A small tributary to the West Fork of Eklutna Creek adds between 0.02 – 0.24 acres of potential spawning habitat.

Low water transparency (caused by high turbidity) and low nutrients levels in Eklutna Lake correlate with low levels of chlorophyll *a* (an indirect indicator of primary production). The low algal biomass within Eklutna Lake likely corresponds to low zooplankton densities (secondary production) and appears to be a limiting factor (i.e., food resource) for fish production in the lake, especially for the resident kokanee population.

A majority of the spawning kokanee collected from Eklutna Lake have Infectious Hematopoietic Necrosis (IHN) and were smaller (4.5-6.5 inches) than those reported in many other lake systems (10–12 inches). The kokanee in Eklutna Lake also differ from other kokanee in their low fecundity (only 20-30 eggs), lack of sexual dimorphism, and lack of spawning color that is typical of the species (Figure 4-8). These are likely an indication of low nutrient concentrations and limited food sources in the environment, and may indicate that Eklutna Lake, in its existing condition, may not provide productive potential rearing habitat for large populations of ocean-run salmon.

Figure 4-8. Typical spawning Kokanee in Eklutna Lake (left) vs. other lake systems (right).

It has been theorized, but not studied, that if fish passage was provided into Eklutna Lake, the spawning salmon would bring enough marine derived nutrients with them. However, high turbidity in Eklutna Lake would still limit light penetration. The high turbidity in the lake is caused by runoff from the retreating Eklutna Glacier. Like the Eklutna Glacier, the nearby Skilak Glacier is also retreating. Elevated runoff from the retreating Skilak Glacier produces more silt (i.e. turbidity), blocking sunlight, reducing the euphotic zone, and diminishing zooplankton densities. The result is fewer zooplankton (e.g. copepods) available as a food resource for juvenile sockeye. Research by ADFG in 2004 showed that the average weight of juvenile sockeye in Skilak Lake was almost half of what was typical. If a critical summer weight size isn't achieved, overwinter survival of juvenile sockeye will be poor and at some point, will have a substantial impact on sockeye returns. As the Eklutna Glacier retreats further, we can expect a similar trend of increasing turbidity in Eklutna Lake as well.

It also important to note that no adult sockeye were observed spawning in the lower river during the 2-year study program. Therefore, any attempt to establish a sockeye salmon run in the Eklutna watershed would either rely on sockeye straying from other river systems or intentional stocking efforts.

4.11.9.2 Upstream Fish Passage

Gravity Flow Fish Ladder

The gravity flow fish ladder measure includes the construction of a new technical fishway at the existing Eklutna Dam. The fish ladder would be of the weir and orifice or vertical slot style with an entrance below the dam and exit at fixed elevation on the upstream side of the dam. For proper function, the water surface elevation of the lake must maintain relatively constant during spawning season, resulting in the inability to utilize any of the reservoir storage for power generation purposes. For this reason, this alternative was not included in any of the preferred comprehensive alternatives.

Variable Exit Fish Ladder

The variable exit fish ladder measure is included in three of the 12 comprehensive alternatives proposed by stakeholders. The design and construction are similar to the gravity flow fish ladder measure; however, the exit includes a series of gates corresponding to varying water surface elevations which allow for approximately 15-feet of reservoir fluctuation. While allowing for some operational flexibility and continued hydropower generation, this alternative being combined with the existing dam structure for flow releases still requires the hydroelectric powerhouse to be offline throughout the winter, when power demand is the

highest. For this reason, the variable exit fish ladder and release through the existing dam was not included as part of the Project Owners' Proposed Final Program.

Fish Ladder with Pumped Water Supply and Slide

The fish ladder with pumped supply and slide measure includes the construction of a new technical fishway at the existing Eklutna Dam with a chute or slide to return fish to a lower water surface elevation within the lake. The fish ladder would be of the weir and orifice or vertical slot style with an entrance below the dam and exit at a false weir located at the dam. Water from the lake would be pumped continuously over the weir during spawning season providing attraction flow for salmon. From the false weir, migrating adults would fall into a chute or slide and enter Eklutna Lake at a reduced water surface elevation. While this alternative allows for operations of the reservoir for power supply purposes, the reliance on pumps for providing flow to the ladder presents a significant risk. Additionally, this method of fish passage has little to no precedence at existing dams. For these reasons this measure was not included in any of the stakeholder comprehensive alternatives.

Trap and Haul

A trap and haul facility was proposed for analysis early on by the Project Owners to be combined with either the AWWU Portal Release or AWWU Pipeline Release measures. The proposal included the addition of a false weir, holding pond with crowder, and lift to transport migrating adults to a truck for transport to Eklutna Lake. While this measure would allow the Project Owners to maintain current reservoir operations and operate the powerhouse year-round, it was ultimately not selected as part of the Project Owners' Proposed Final Program due to the lake studies concluding that Eklutna Lake has little to no productivity potential and would likely not support a healthy fishery as evidenced by the condition of kokanee residing in the lake. In addition, this upstream fish passage option received no support from any of the stakeholders.

4.11.9.3 Downstream Fish Passage

Spill

One measure proposed for allowing downstream passage of out-migrating juvenile salmonids is to release a significant flow from the dam via a new spillway gate, or by uncontrolled release over the existing spillway from April through June. While this approach is viable, due to the size, depth, and layout of Eklutna Lake, a spill event on the order of 300-500 cfs would provide very low attraction velocities within the lake itself, resulting in substantially reduced efficacy of downstream passage. Additionally, the volume of water released in a spill event of this magnitude for a duration of up to 3 months results in a significant portion of the reservoir

annual inflow volume being utilized for downstream passage rather than for power generation purposes. For these reasons spill was not proposed for downstream passage as part of the Project Owners' Proposed Final Program.

Floating Surface Collector

To preserve water for power supply purposes, an alternate method for downstream passage was proposed, consisting of a floating surface collector located at or near the intake or the lake outlet. This floating barge structure would consist of guidance screens and attraction flow pumps moving approximately 500 cfs through the screens to attract and capture migrating juveniles. A primary concern with the usage of floating surface collector for downstream passage is that the barge must operate in ice-free conditions. At Eklutna Lake, ice breakups typically occur in May to June, which results in the floating surface collector being inoperable for 50%-70% of the theorized outmigration window. Additionally, as presented in the cost estimate summary, these structures have substantial capital and operating expenses. For these reasons, the floating surface collector was not included as part of the Project Owners' Proposed Final Program.

Other Downstream Passage Measures

During the Aquatics TWG meeting on November 9, 2022, two other downstream fish passage measures were discussed: 1) volitional downstream fish passage through the existing intake, and 2) trap and haul downstream fish passage utilizing a rotary screw trap and guide net. However, after preliminary evaluation, it was determined that neither of these measures would have a high success rate; therefore, neither measure was selected by the Aquatics TWG for further evaluation.

4.11.10 Trapping Facility with Hatchery Spawning, Rearing, and Release

During the Aquatics TWG meeting on November 9, 2022, the concept of a trapping adult salmon at the flow release point, spawning the adult salmon and rearing the juvenile salmon at a hatchery, and then releasing the juvenile salmon back into the Eklutna River. This method would likely result in a higher survival rate which would accelerate the salmon population growth in the river. However, the Aquatics TWG strongly opposed the idea of a hatchery; therefore, this measure was not selected by the Aquatics TWG for further evaluation.

4.11.11 Replacement Dam

The base of the existing Eklutna Dam is located on a depositional shelf approximately 200-ft higher in elevation than the deepest portion of Eklutna Lake and approximately 60-ft higher in elevation than the intake elevation for the power tunnel. As described in Section 4.11.4,

providing continuous releases to the Eklutna River from the existing dam significantly curtails power generation and reduces the active storage volume of the reservoir by over 80%. An alternative proposed to reduce restrictions on reservoir operations while providing year-round hydroelectric generation involves the excavation of the depositional shelf at the existing dam and construction of a replacement dam in its place. The excavation would require construction of a channel approximately 20-ft deep, 50- to 350-ft in width, and 1-mile in length resulting in removal of approximately 550,000 cubic yards of material. The replacement dam would have an overall height of approximately 56-feet and incorporate a spillway and fish passage structures.

This alternative would restrict the minimum reservoir operating elevation to El. 840 ft, removing approximately 40% of the storage capacity of the reservoir. While this allows operation of the Eklutna Power plant year-round in an average water year, it requires some operational restrictions and reduces flexibility in hydropower generation seasonally.

The replacement dam is included in four of 12 comprehensive alternatives proposed by stakeholder groups. While the replacement dam concept continues to allow hydroelectric generation year-round, the cost of this measure and loss of reservoir capacity are the primary reasons it is not included within the Project Owners' Proposed Final Program. Dependent on the measure chosen for downstream fish passage, the replacement dam alternatives range from a capital cost of approximately $120M to $180M[14] which results in a significant additional burden on ratepayers and taxpayers. A summary of the costs of the replacement dam alternatives compared to the Project Owners' AWWU portal valve alternative is presented in Table 4-4.

Table 4-18. Cost Comparison Summary – Replacement Dam.

Entity	Alternative Measure	Capital Cost ($)	Annualized Cost ($/Yr)	CEA Rate Impact (%)	MEA Rate Impact (%)	MOA Tax Impact ($/100k)
Project Owners	AWWU Portal Valve	$20,482,860	$3,898,161	0.78%	1.07%	$1.03
TCF	Replacement Dam	$118,129,000	$19,776,000	3.81%	5.31%	$4.46

[14] The cost estimate for the replacement dam measure was developed in close coordination with Eklutna Inc. and has a median construction cost of $113M with a class 5 estimate range of $57M to $220M. Following development of the original estimate, Eklutna Inc. had recommended a few revisions to the costs including providing a new location for material disposal which resulted in a potential cost savings of approximately $25M. The revision falls within the price range of the original estimate and will be considered if the design of this measure is advanced.

NVE	Replacement Dam	$122,853,000	$22,006,000	4.24%	6.10%	$4.62
USFWS Alt A	Replacement Dam	$158,719,000	$23,483,000	4.61%	5.50%	$7.48
NMFS	Replacement Dam	$177,833,000	$25,465,000	4.91%	5.89%	$8.32

4.12 NVE Comment Summary

As stated in their June 2020 letter to NVE, the Project Owners committed to submitting an NVE-specific comment summary to the Governor for consideration along with the Project Owners' Proposed Final Program.

4.12.1 Dam Replacement – NVE's First Preferred Alternative

In July 2023, NVE identified the replacement dam as their preferred alternative (see Section 4.5.4). NVE's preferred year-round instream flow regime was 350 cfs in July and August, 150 cfs in September and October, and 65 cfs throughout the winter. NVE's preferred channel maintenance flow regime was 700 cfs annually. Channel maintenance flows would be provided through a fixed wheel gate and upstream fish passage would be provided through a fish ladder (both consistent with the conceptual design of the replacement dam). Downstream fish passage would be provided through spill.

As described in Section 4.11.11, the replacement dam was not selected by the Project Owners primarily because of the associated costs and the 40% reduction in storage capacity for the reservoir.

4.12.2 Dam Removal – NVE's Second Preferred Alternative

Following the publication of the Draft Program, NVE proposed a new preferred alternative that requires removal of Eklutna Dam and decommissioning of the Project. NVE stated the following in their comment letter dated December 4, 2023:

> "To meaningfully meet the purpose of the Agreement, NVE proposes an alternative solution – removing the Eklutna Lake dam within ten years when sufficient renewable power generation is available to offset the lost power generation from dam removal."

NVE's second preferred alternative proposal contained no analysis of costs or risks of removing the Project dam or replacing its energy and capacity. In response to the letter, the Project Owners engaged engineers and hydrologists to conduct a high-level analysis of the

technical risks and cost implications associated with the removal of the Project. This investigation evaluated the effects that an unregulated river hydrograph may have on infrastructure on or adjacent to the Eklutna River downstream of the existing dam, summarized the costs associated with dam removal and decommissioning of Project infrastructure, investigated potential mitigation measures where necessary to address such risks, and analyzed the use of other comparable renewable energy sources to determine how to offset the lost generation from the Project. A memorandum documenting this analysis and the results is included in Attachment F.

The dam removal analysis revealed that if the Project were removed and the expected stream flows were allowed to flow unregulated down the Eklutna River, AWWU's water pipeline infrastructure would be at significant risk and the New Glenn Highway bridges and Alaska Railroad bridge would need to be replaced. Note that this analysis was limited to large public infrastructure and did not include an assessment of negative effects (or potential liabilities) arising from the inundation of lands on downstream landowners during high water flood events, including Eklutna, Inc. and NVE. Additionally, the assessment showed that mitigating the risks to the downstream infrastructure and replacing the Project energy and capacity with firm renewable energy would cost more than $500 million in total known costs in 2034 dollars.

Ultimately, given (1) the likely adverse impacts to the municipal water supply and downstream infrastructure, including the buried AWWU pipeline, New Glenn Highway bridges, and railroad bridge, (2) the cost of replacing the Project's capacity and energy generation, (3) the Project Owners' overall renewable energy goals, and (4) the dwindling natural gas supply in Cook Inlet, the Project Owners determined it would not be prudent or rational for the Project Owners to include dam removal in the Proposed Final Program.

4.12.3 Pump Station and Dam Removal – NVE's Third Preferred Alternative

On April 9, 2024, NVE proposed a new alternative still centered on the removal of Eklutna Dam "by 2034." However, in addition to all the costs and risks that would be created by dam removal outlined in Section 4.12.2 and Attachment F, NVE's third alternative also included additional requirements to obtain "40 MW of replacement renewable energy" within 10 years and the obligation to construct and operate an alternative Eklutna River Release Facility through the construction of a pump station that would pump water from Eklutna Lake to the small pond upstream of Eklutna Dam, and then release water from the dam into the river year-round (see Section 4.8). This pump station would remain in place and operating after the dam is removed to ensure that AWWU can maintain its full withdrawals and, if necessary, keep the river watered during dry winter months. NVE's third alternative also proposed other Program elements, such as creation of an earnings fund reserve, amending the 1991 Agreement to

delay its process and implementation, and including NVE as a permanent member of the Monitoring and Adaptive Management Committee.

As with its second preferred alternative, NVE's third preferred alternative proposal contained no analysis of costs or risks to the Project Owners or any other entity. The Project Owners acknowledge that NVE's proposed pump station is a viable alternative to the proposed Eklutna River Release Facility from an engineering perspective, and the Project Owners actually studied and considered variations of the pump station alternative during early analysis of all potential alternatives that were identified. Ultimately, however, the idea was not advanced as a preferred alternative because the pump station depends on the proper functioning of a powered mechanical system; if that powered mechanical system fails, the consequence could be catastrophic to the downstream fish populations and habitat that would depend on future flow releases. The Project Owners' proposed Eklutna River Release Facility does not depend upon a powered mechanical system to provide instream flows; rather it requires only gravity. Unlike the pump station, if there is a power outage for an extended time (which is somewhat likely given its location), then the Project Owners' Eklutna River Release Facility would continue to function by simple gravity flow from the river release valve. The Project Owners know of no instream flows established at any hydroelectric project in the U.S. that depends upon the proper functioning of a powered mechanical system to convey water, especially one in a remote location with complex supporting infrastructure.

The Project Owners expect that the capital costs of the pump station would significantly exceed the $10 million of estimated capital costs for the proposed Eklutna River Release Facility. The Project Owners disagree with NVE's statement that the $8.4 million capex figure developed for the siphon alternative as part of phase 1 engineering is reflective of what the pump station would cost. The pump station would be significantly more expensive due to the cost of the deep wet well excavation and boring of the intake pipe as proposed. Additionally, the Project Owners expect that the operational and maintenance costs of the pump station would far exceed the proposed Eklutna River Release Facility as the pumps require a continuous energy draw to operate and the emergency generator would need regular servicing and maintenance. The new access road construction, distribution line, and electrical building required by the pump station, all to be located so close to the state park recreation and campground facilities, may raise potential sound and aesthetic concerns.

Furthermore, the Project Owners do not believe that the proposal to provide power to the pump station using the existing system's 12.47 KV single-phase line on wooden poles would be adequate. A more robust distribution system would need to be erected at a much higher expense. Seven miles of 3-phase distribution lines in that territory would cost roughly $2 million. Finally, the Project Owners estimated that NVE's pump station alternative would not accommodate channel maintenance flows allowed under the Proposed Final Program.

Consequently, the Project Owners determined it would not be prudent or rational for the Project Owners to agree to the costs and risks of NVE's third preferred alternative (dam removal starting in 2034, 40 MW of replacement renewable energy, and the pump station). With all due respect to NVE, the Project Owners must observe prudent utility practices and our obligations to our member-ratepayers. The Project Owners also reject the need for fund reserve and ability to amend the 1991 Agreement without Congressional approval. The Project Owners did agree to name NVE as a permanent member of the Committee as set forth in Section 3.1 of the Proposed Final Program.
